The relatively frequent occurrence of apparent adrenal insufficiency in patients maintained on cortisone for long periods following exposure to severe stress has led us to investigate the suppressing effect of cortisone on the pituitary, adrenal, and thyroid glands. These investigations have been carried out in cooperation with Dr. Lewis Engel of the Huntington Laboratories and Dr. Farahe Maloof of the thyroid study unit. The initial studies concerned a small group of patients, maintained on daily oral cortisone in doses of 75 to 100 mg. for periods of two to four years. The response to increased demand for endogenous adrenal and pituitary hormones was studied by means of balance measurements, steroid excretion studies, daily eosinophil counts, and close clinical observation throughout two surgical procedures in one patient and after the abrupt cessation of the cortisone therapy in three patients. These data revealed that the one patient failed to display the normal catabolic response to surgery and the customary rise in urinary excretion of corticoids. The data obtained following the cessation of cortisone therapy suggested that there was an immediate increase in secretion of ACTH. Either because this secretion was quantitatively insufficient, or because of adrenal unresponsiveness, the secretion of adrenal hormones was both inadequate in amount and abnormal in nature. This abnormal adrenal response caused a variety of interesting metabolic and clinical phenomena currently in process of investigation. This "cortisone withdrawal syndrome", normally about ten days in duration, was arrested promptly by the intravenous or intramuscular administration of ACTH. For this reason, it is our belief that pituitary atrophy is associated with maintenance cortisone therapy and is of greater clinical importance than the adrenal atrophy.

The mechanism of the thyroid-depressing effect of cortisone has never been elucidated. Interesting new data on this phenomenon have been provided by determining the radioactive iodine uptake on several patients both before and after abrupt cessation of cortisone. These data suggest that in some patients cortisone acts as a goitrogenic agent. Further studies of these endocrinological interrelationships are in progress.

One of the side effects of long-term cortisone therapy which has interested us greatly has been the effect of this agent on calcium metabolism. Review of annual balance studies in these patients suggests that after three years of therapy the loss of calcium is due largely to the activity of the rheumatoid process. This problem is being further elucidated by determining the calcium, phosphorus, and nitrogen content of the bones of cortisone- and non-cortisone-treated patients dying with rheumatoid arthritis.

In view of the profound metabolic effects of orally administered cortisone, the value of intra-articular steroids has been studied again, particularly the variations in degree and duration of benefit. Because of the inconsistent effects, the injection of new steroids in a large group of patients is under way. Dr. Frank Austen and Dr. Calkins have studied the effects of serial intra-articular injections of both hydrocortisone and hydrocortisone acetate. Although the subjective benefits are difficult to evaluate, objective studies revealed that administration of the hydrocortisone acetate was followed by a rapid and pronounced shift toward normal in all the characteristics of the synovial fluid in every case. Free hydrocortisone failed to produce any objective changes in the fluid of some patients; and in the others the effects were exceedingly transitory. Inasmuch as hydrocortisone is known to be much more soluble than hydrocortisone acetate, this study suggests that insolubility may be a desired physical characteristic of the ideal intra-articular steroid, and that objective criteria are more valuable than subjective criteria in the evaluation of steroids.

Butazolidin, another recently introduced drug for the treatment of arthritis, has been studied by Dr. Short. His results are in agreement with those reported by others, namely, that this agent is more beneficial in patients with rheumatoid spondylitis than in individuals suffering from the peripheral form of rheumatoid arthritis.

Follow-up studies

The advent of these new therapeutic agents has served to emphasize the need for better methods for the systematic evaluation of therapeutic regimes, both new and old, on the course of rheumatoid arthritis and related diseases. Our follow-up study clinic provides such opportunities.

The cross-section description of rheumatoid arthritis, based on the detailed studies of the first 293 cases carefully studied in this clinic, is now in its final stages and should be submitted for publication shortly. An example of the type of information obtained from this study is the observation by Dr. Short that of the 80 patients who experienced remissions, these were complete in 85 percent of these cases. This is a fact which, in itself, must be taken into consideration in the evaluation of any form of therapy. Half of these 80 patients exhibited a pre-hospital admission course consisting of attacks and remissions each of less than one year's duration. Thirty-nine percent of the patients had brief attacks and long remissions. The data further showed that when an attack of rheumatoid arthritis persists longer than a year, the prospect of a spontaneous remission becomes less likely. Analysis of the factors associated with exacerbations and remissions revealed other interesting information, namely, in regard to the month of onset of both initial and subsequent exacerbations. The onset of the disease, which in a sense should be considered the initial exacerbation, occurred more frequently in "the colder months of the year". The possible etiological implications of this demonstration of the seasonal nature of rheumatoid arthritis should not be lost sight of in any consideration of its etiology. Some of the possibilities other than climatic changes that must receive equal consideration are:

First, the increased frequency of respiratory injections during the winter months. In the case of rheumatic fever, attacks occur in the United States predominantly in late winter and early spring and are believed to correspond to the seasonal prevalence of hemolytic streptococcus infections.

Next, by analogy, the marked seasonal variation in the incidence of certain infectious diseases, chiefly of virus origin. For example, measles and poliomyelitis occur in epidemic form in entirely different seasons of the year.

A third possibility rests upon differing nutritional requirements according to season. Recent studies in pellagra indicate that an increased metabolic requirement for water-soluble vitamins in late spring and early summer is responsible for outbreaks of pellagra at this season.

Finally should be mentioned the inactivity and even atrophy of endocrine organs in certain animals during the winter months, including the anterior pituitary and adrenal cortex. As far as we know, this has not been demonstrated in man.

This follow-up clinic study, in addition to supplying leads such as those cited above, serves to emphasize two other points: first, the need for establishing simple reproducible criteria for the quantitative description of the clinical course of rheumatoid arthritis, and secondly, the need for designing and conducting controlled therapeutic trials of all measures used in the treatment of this disease—notably aspirin, cortisone, and, if possible, bed rest.

To assist us in the achievement of these needs, Dr. William Reynolds, formerly a Milbank Fellow in Preventive Medicine, has been made a senior member of the connective tissue study group. He will be supported by a five-year Senior Fellowship from the Arthritis and Rheumatism Foundation. His present work includes an examination of the subjective clinical measurements of "activity" of rheumatoid arthritis and an attempt to devise suitable objective measurements of these manifestations.

Within the next year, the group intends to embark on a new long-term follow-up study of a group of selected patients with rheumatoid arthritis, using the systematic follow-up methods already in effect in this clinic, supplemented by sound objective determinations. Dr. Short will serve as chairman of the committee consisting of Drs. Ropes, Reynolds, Zeller, and Calkins, which will review the objectives of such a study and the specific techniques to be used. Once these recommendations have been put into effect, the follow-up arthritis study clinic should be a more rewarding, educational, and learning experience. For example, it is hoped that a more systematic study of the factors associated with exacerbations of connective tissue diseases will be forthcoming. An attempt to devise more objective measurements of joint inflammation as well as articular function will be undertaken. Prediction of the occurrence of remissions and exacerbations on the basis of these findings as well as psychiatric and physiologic data will be attempted. We are seriously considering the possibility of extending this approach to include a study of normal individuals and relatives of connective tissue disease patients, as well as the patients themselves.

In addition to these forward-looking, long-range projects, members of the study group will continue, as they have in the past, their interests in specific clinical problems—usually those raised by the individual patients previously observed. Whereas these "backward-looking" studies usually do not permit the employment of comprehensive statistical methods, they yield information of great value which can be subjected to more careful scrutiny in the future.

One such example is the recent observation that certain patients with rheumatoid arthritis, primarily those whose spines are involved, have a form of heart disease which is distinct from that caused by rheumatic fever, syphilis, or lupus erythematosus disseminatus. It is manifested clinically by aortitis and lone aortic insufficiency which is frequently the cause of angina pectoris and occasionally left ventricular failure. Pathologically, the lesion resembles syphilitic aortitis with a widened aortic ring and non-adherent valves. Typical rheumatoid nodules have been seen microscopically, thus establishing the etiology of this newly recognized form of heart disease.

A detailed analysis of ocular manifestations of rheumatoid arthritis is another study of this type. This has been undertaken at the clinical and pathological levels by Drs. Donald Mitchell and Parker Heath. The most serious ocular manifestation encountered in this study of 1200 clinic patients was involvement of the uveal tract and iris, frequently leading to blindness. The clinical features and prognosis of these ocular lesions have been described in detail. To our knowledge, this represents the most exhaustive study yet completed on this little appreciated aspect of rheumatoid arthritis.

These latter studies illustrate the immense value of this "pedigreed" group of patients. Their carefully documented records, including methodical follow-up observations, provide for the newcomers to our group a long-range view of this chronic disease and the opportunity to obtain a perspective which ordinarily is gained only by years of clinical work. Thus, the experience with one patient can quickly be compared with that of a much larger group exhibiting similar clinical findings. Many compilations of such data reach eventual publication; many others do not. The latter outcome, however, does not lessen the great benefit of the experience for either the individual physician in question or his associates. No doubt such opportunities are of importance in attracting clinical and research fellows from all sections of this country and abroad. We are proud of Drs. Blais, Bocking, Bywaters, Clark, Engleman, Horowitz, Mitchell, Tonning, Weinberger, and other alumni who now head their own rheumatic disease study units elsewhere; Drs. Gall and Schaffer, who head departments of pathology and bacteriology, respectively; and especially of Dr. Granville A. Bennett, Professor of Pathology and recently appointed Dean of the University of Illinois Medical School.

Thus, the fundamental objectives of the group remain unchanged after twenty-six years: care of the patient, teaching, and research. All of these depend for their accomplishment on the maintenance of a top-flight study clinic, with its body of patients who are constantly available for specific clinical or metabolic studies. These patients yield their synovial fluid, blood, and tissues for chemical characterization; they provide difficult and unanticipated situations demanding treatment; and above all, they constantly raise questions that no one of us can answer.

In closing, on behalf of our patients and staff physicians, we should like to express our great appreciation to the many other members of the team who have made the activities of the unit possible. Research and clinical technicians, nurses, secretaries, members of the Social Service Department, the men in the orthopedic workshop, medical illustrators, record room librarians, and countless others have joined us in this common endeavor. We thank them.

Walter Bauer, M.D.,
Chief of Medical Services

* * *

As a result of the wish of the late Dr. Francis T. Hunter that gifts to the Boston Medical Library should take the place of floral tributes to his memory, a number of his friends are desirous of establishing a permanent memorial to Dr. Hunter as part of the plan for enlarging and modernizing the facilities of the Library. Contributions to this fund will be welcomed and may be sent direct to the Library, 8 The Fenway, with this designation.

* * *

After a good many years of effort, plans have been completed and contracts let for the construction of the new medical science building to house the laboratories and offices of the Departments of Pathology, Dermatology, Neurology, and Psychiatry. This building will take the form of a five-story west wing of the Baker Memorial, extending almost to Charles Street and connecting with the Phillips House by a two-story link. There will also be constructed a second story on the corridor connecting the Phillips House with the Baker and White Building. In the new building Pathology will occupy the basement and first two floors above ground, and the other three Departments the three floors above those.

Construction should take about thirteen months, and the total cost will be in the neighborhood of $2,000,000. Additional funds will be needed if the floor for Psychiatry is to be finished; the present plan includes only the shell of this floor. Additional funds are also desired toward the base cost, in order to save as much as possible of the Hospital's General Funds.

The architects for the building are Shepley, Bulfinch, Richardson, and Abbott, and the contractor is the George A. Fuller Company.

The Board of Trustees, at their meetings on September 10 and 24, and October 8, voted:

To accept the resignation of Dr. Robert S. Bandurski from the position of Assistant in Biochemistry, effective as of September 19.

To reappoint:

Dr. George B. Murphy, Jr. as Third Assistant Resident in Surgery, beginning September 7.

To appoint:

Dr. Morris H. Adler as Assistant in Psychiatry, effective September 1;
Dr. John A. Benson, Jr. as Assistant in Medicine, effective as of October 1;
Dr. Carl A. L. Binger as Consulting Visiting Psychiatrist, effective as of September 1;
Dr. James J. Crumbley, Jr. as Interim Resident in Medicine, for the term August 27 through September 30;
Dr. Richard A. Field as Chief Resident in Medicine, beginning January 1, 1955;
Dr. Boy Frame as Resident in Medicine, beginning January 1, 1955;
Dr. Elizabeth G. French as Assistant to the Children's Medical Service;
Dr. Felix G. Freund as Fellow in Anesthesia for one year, beginning October 1;
Dr. George W. Geiss as Assistant in Physical Medicine, beginning October 1;
Dr. John H. Lamont as Assistant in Psychiatry, effective September 1.

At their meetings on September 15, 22, and 29, the General Executive Committee voted:

To promote:

Dr. Si-Chun Ming from the position of First Assistant Resident in Pathology to that of Resident for one year, beginning January 1, 1955.

To reappoint:

Dr. Thomas Frank as Clinical Assistant to the Children's Medical Service for one year, beginning August 15;
Dr. Patrick A. Ongley as Clinical Fellow in Medicine, assigned to Cardiology, for the period beginning October 1;
Dr. Elbert P. Tuttle, Jr. as Clinical and Research Fellow in Medicine for one year, beginning October 1.

To appoint:

Dr. Henrik H. Bendixen as Clinical Fellow in Anesthesia for one year, beginning December 1;
Dr. Dorothy H. Henneman as Research Fellow in Anesthesia for one year, beginning September 1;
Dr. Kiyoshi Inada as Graduate Student Assistant in Surgery, effective as of September 7;

Elizabeth B. Keller, Ph.D. as Assistant Biochemist (Medicine), effective as of July 1;
Mr. Thomas F. Lohr as Research Fellow in Anesthesia, for a period of five months, beginning September 1;
Harris S. Moyed, Ph.D. as Research Fellow in Biochemistry, effective as of September 1;
Dr. Stuart H. Mudd as Research Fellow in Biochemistry, effective as of July 1;
Dr. Robert L. Nielson as Clinical and Research Fellow in Medicine for one year, effective September 13;
Dr. Victoriano Pardo-Menendez as Graduate Student Assistant in Pathology, effective as of September 13;
Mr. Richard R. Peebles as Research Fellow in Psychology, for a period of six months, beginning September 6;
Ann Ross, A.B. as Research Fellow in Psychology, effective September 20;
Leonard B. Spector, Ph.D. as Assistant Biochemist (Medicine), effective as of July 1;
Dr. Malcolm Thompson as Clinical and Research Fellow in Medicine, effective as of December 6;
Babette S. Whipple, Ph.D. as Research Fellow in Psychology, for the period September 6, 1954 through January 2, 1955.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor considerable unnecessary time and trouble when you fail to include it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Allergy

Burrage, W. S., Burgin, L. B., Wang, D. M. K., and Irwin, J. W.
Allergy in infancy and childhood.
In M. Clin. North America, vol. 38, no. 5, Philadelphia, W. B. Saunders Company, pp. 1255-1279.

Anesthesia

Cullen, S. C., Comroe, J. H., Jr., Brown, E. B., Jr., Beecher, H. K., and Maloney, J. V., Jr.
Problems in ventilation: A panel discussion.
Anesthesiology 15: 416-435.

Lasagna, L., and Beecher, H. K.
The optimal dose of morphine.
J.A.M.A. 156:230-234.

Neurophysiology

Brazier, M. A. B.
Electroencephalography.
In Progress in Neurology and Psychiatry, vol. 9, E. Spiegel, Editor, New York, Grune & Stratton, chapter 12.

General Surgery

Bartlett, M. K., and McDermott, W. V., Jr.
Amputation neuroma of the bile ducts with obstructive jaundice.
New England J. Med. 251:213-216.

Riddell, A. G., and McDermott, W. V.
Hepatic coma.
Lancet, June 19:1263-1267.

Laboratory Science

Irwin, J. W., Burrage, W. S., Aimar, C. E., and Chesnut, R. W., Jr.
Microscopical observations of the pulmonary arterioles, capillaries, and venules of living guinea pigs and rabbits.
Anat. Rec. 119:391-407.

Weille, F. L., Martinez, D. E., Gargano, S. R., and Irwin, J. W.
An experimental study of the small blood vessels of the spiral ligament and stria vascularis of living guinea pigs during anaphylaxis.
Laryngoscope 64:656-665.

Ophthalmology

Johnson, C. C.
Blepharoptosis: A general consideration of surgical methods.
Am. J. Ophth. 38:129-162.

Pathology

Atkins, L.
Progeria.
New England J. Med. 250:1065-1069.

Burt, A. S., Reiner, L., Cohen, R. B., and Sniffen, R. C.
Klinefelter's syndrome: Report of an autopsy, with particular reference to the histology and histochemistry of the endocrine glands.
J. Clin. Endocrinol. & Metab. 14:719-728.

Sniffen, R. C., Howard, R. P., and Simmons, F. A.
The testis. IV. Idiopathic eunuchoidism with low FSH; testicular changes secondary to lesions in or near the pituitary and secondary to estrogen therapy.
A.M.A. Arch. Path. 57:464-480.

Thomas, W. A., Randall, R. V., Bland, E. F., and Castleman, B.
Endocardial fibroelastosis: A factor in heart disease of obscure etiology. A study of 20 autopsied cases in children and adults.
New England J. Med. 251:327-338.

White, P. D., and Fennell, R. H., Jr.
Endocardial fibro-elastosis with marked cardiac enlargement and failure in a man who died at the age of 71 after 15 years of angina pectoris and two years of congestive heart failure.
Ann. Int. Med. 41:333-342.

Miscellaneous

Brazier, M. A. B. (translator)
The epilepsis, by Henri Gastaut.
Springfield, Ill., Charles C. Thomas.

Monks, J. P., and Heath, C. W.
A classification of academic, social, and personal problems for use in a college student health department.
Student Medicine 2:44-62.

In addition to the article by Drs. Riddell and McDermott which appeared in the June 19 issue of *The Lancet,* that same English journal has referred to the work of members of our Staff in two of its recent editorials.

VOLUNTEER GROUPS

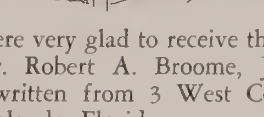
MGH STAFF WIVES HOSPITAL COMMITTEE

Instead of the usual Fall Morning Coffee at the Hospital, meetings will be at the homes of the Community Chairmen. This will give the new President, Mrs. Oliver Cope, an opportunity to become better acquainted with the Staff Wives, and to more conveniently receive suggestions for Staff Wives activities for the coming year.

Both the Hospitality Committee and the Music Committee have already commenced activities for the season. A most enjoyable tea was given by Mrs. Edwin Cole on October 6 in the Medical Staff Room, to welcome those persons who have recently arrived from abroad to work and study at the M.G.H., and to greet those from other countries who have been at the Hospital during the past year. It is expected that a second tea will be given toward the end of January, and a third in early April. Any Staff wife who would like to avail herself of the opportunity to meet these friends from abroad will be cordially welcomed. Those who would like to become better acquainted may obtain names and addresses from Mrs. Raymond Adams, Hospitality Chairman, by telephoning her at BL 8-8442.

The first fall concert for patients, arranged by the Music Committee, was given in the Chapel on October 20. The next concert took place on November 3, and it is hoped there will be a third one on November 17. These concerts provide a real source of pleasure to patients. Except for the assistance of Staff Wives and their friends, however, the patients would be unable to attend, as the Hospital personnel cannot take time from regular duties to convey patients to and from the Chapel. Mrs. James Burns, LA 7-5020, would welcome hearing from any person who could occasionally help in escorting these patients. The concerts are usually held from 2:30 to 3 P.M.

The furniture exchange has been meeting a real need on the part of persons from abroad and those from other sections of the States who are here only temporarily and who find that furnished apartments are too expensive. Mrs. Richard Sweet, LO 6-5671, or Mrs. Charles Burbank, BE 2-1648, would be pleased to hear from anyone having furnishings to contribute to the exchange.



We were very glad to receive this letter from Dr. Robert A. Broome, Jr. (*M.* 1944), written from 3 West Columbia Street, Orlando, Florida:

> I enjoy reading THE NEWS, and it helps to keep up with both people and publications.
>
> I have been here in Orlando for four years now, in a very satisfying practice of Internal Medicine and Cardiology, in partnership with a classmate.
>
> Dr. Merrill Wattles, here, is a graduate of the Eye and Ear; and Miss Rachel Brown, a fine nurse of the 1950 class, is one of our head nurses at the Orange Memorial Hospital. You can probably tell me of some more MGH folk here that even I don't know about!
>
> Best wishes to all.

New addresses:—

Dr. Kenneth T. Bird (*M.* 1944), 5 Bay State Rd., Boston 15, Mass.
Dr. Theodore S. Golden (clin. assoc. *C.M.*), 52 Lincoln St., Framingham, Mass.
Dr. Buford Hall (*M.* 1946), 1853 West Polk St., Chicago 12, Ill.
Lt. Charles E. Huggins, MC, USNR (*S.*

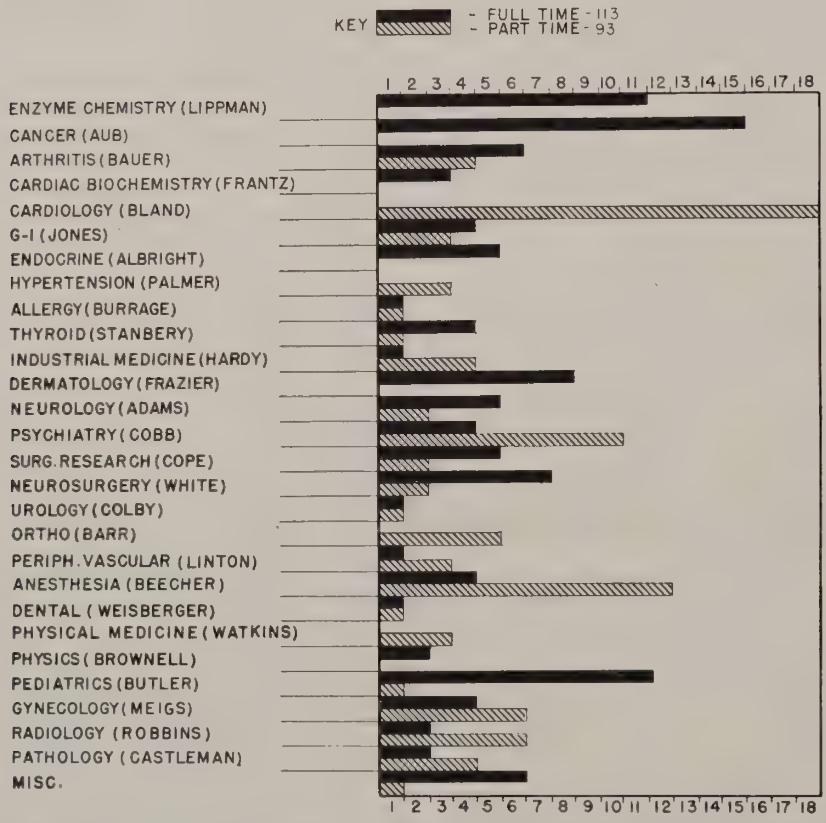
M.D. AND Ph. D. INVESTIGATORS AT M.G.H.



1953), Naval Medical Research Institute, National Naval Medical Center, Bethesda, Md.

Dr. Adil O. Icgoren (clin. fel. *R.* 1954), Kadikoy Moda Caddesi #129, Istanbul, Turkey

Dr. Knowles B. Lawrence (clin a. *S.*), 1683 Beacon St., Brookline, Mass.

Dr. Alexander Leaf (*M.* 1944), Radioisotope Division, Zoophysiology Laboratory, University of Copenhagen, Copenhagen, Denmark

Lt. David J. L. Luck, MC, USAF (*M.* 1954), 5029 North Lake Drive, Milwaukee 11, Wis.

Dr. Julio Quevedo (*Oph.* 1933), 15 Calle 6-59, Guatemala City, Guatemala

Dr. John W. Raker (*E.S.* 1942), Pennsylvania Hospital, Philadelphia, Pa.

Dr. Marion L. Smith (a.r.p. *An.* 1951), 544 West Second St., Lexington, Ky.

Lt. Ernest A. Sneddon, MC, USNR (r.p. *An.* 1954), U.S. Naval Hospital, Chelsea, Mass.

Dr. Weldon W. West (*S.* 1948), 309 Regent Court, Stockton 4, Calif.

Brief bits:—

Dr. Robert S. Bandurski has resigned as Assistant in Biochemistry, to assume a position at Michigan State College, East Lansing, Michigan.

Dr. Edward B. Benedict recently attended the Fall Clinical Session of the Maine Medical Association in Portland, where he presented a paper on "Endoscopic aids in diagnosis".

Dr. Charles B. Burbank has been appointed Director of Surgery at Leominster Hospital, Leominster, Massachusetts.

Dr. Walter S. Burrage has been appointed Chief Consultant in Allergy and Member of the Council of Chief Consultants, Veterans Administration, Washington, D.C.

Joseph F. Ciano, D.M.D., has opened his office at 350 Hancock Street, Quincy, Massachusetts.

Dr. Nathaniel W. Faxon has been appointed Medical Advisor by the Welfare Board of Falmouth, Massachusetts. Dr. Faxon is also called upon quite occasionally to investigate conditions in hospitals, both within and outside the State.

Dr. Harriet L. Hardy has just returned from a trip to Europe. She went first to Naples, where she attended the Eleventh International Congress on Industrial Medicine. At this Congress she read a paper on "The clinical use of monocalcium disodium ethylene diamine tetra-acetate in lead poisoning." This meeting lasted a week, and was held in a very picturesque castle overlooking the Bay of Naples. She then went to Milan, where she spent some time at the famous Occupational Medical Clinic, talking with the staff about problems of mutual interest. Finally, she attended the International Congress on chest diseases, held at Barcelona, Spain, during the week of October 4.

Dr. Nils Normann has resigned from the Anesthesia Department, to engage in full-time research at the Jewish Hospital, St. Louis 10, Missouri.

Yale J. Topper, Ph.D. has resigned his position as Research Fellow in Biochemistry. He leaves to assume a position in the Institute for Arthritis and Metabolic Diseases, National Institutes of Health, Bethesda, Maryland.

Dr. Paul D. White has been elected President of the International Society of Cardiology.

Miss Mary R. Wolf became the new permanent Head of our Volunteer Service on October 4.

No. 140 Boston, Mass. December 1954

EMOTIONAL FACTORS IN CHILDREN WITH RHEUMATOID ARTHRITIS

In 1948 the Child Psychiatry Unit first became interested in the emotional aspects of juvenile rheumatoid arthritis, when psychiatric consultation was requested because these children had difficulty in adjusting to hospitalization and their illness. The children showed depressive reactions, feeding problems, and uncooperative behavior, especially toward medication and physiotherapy. Originally we were more aware of emotional disturbance as a consequence of illness and hospitalization. As our experience increased, we became impressed with certain common emotional constellations in these children and their families which appeared to be possible contributing factors in the etiology of the disease. However, we do not believe that emotional factors are the sole explanation for the disease, but that they are interrelated with many other factors, such as heredity, hormones, trauma, and infection. All of the possible causative factors seem to have a complex interrelationship and may vary in relative importance from case to case.

The role of emotional factors in adult patients with rheumatoid arthritis has been the object of study by many investigators, including several from the Massachusetts General Hospital. In 1939 Drs. Cobb, Bauer, and Whiting reported that the onset and recurrence of arthritis related to life situational stress. In 50 arthritic patients they found that 31 had close correlations of arthritis with stress situations of grief, poverty, and family worry. Dr. Alfred Ludwig in his psychiatric studies of adult arthritis patients was impressed with the marked immaturity in their personality make-up. He described them as extremely dependent, insecure, and inadequate to master or cope with the environment. They reacted to emotional crises with intense activity of the autonomic nervous system in a manner resembling patients with traumatic war neuroses. We are unaware of similar psychiatric studies of children with rheumatoid arthritis being reported in the medical and psychological literature.

Since 1948 the Child Psychiatry Unit has collected data on 40 children with rheumatoid arthritis and their parents. The orientation of this investigation has been an exploratory clinical study in which the children were seen in psychotherapy by a child psychiatrist and the parents in casework by a psychiatry social worker. The children were also given psychological tests by a clinical psychologist. This teamwork approach of psychiatrist, social worker, and psychologist is a well-established tradition in the psychiatric treatment and investigation of children. The data we obtained reflect the emphasis on treatment. The children were seen as in patients and out patients in psychotherapy — four being followed for five years and the remainder for varying lengths of time.

General characteristics

The group of 40 children ranged in age from 2 to 16 years, with a striking sex distribution of *29* girls and *11* boys. This ratio of girls over boys with juvenile rheumatoid arthritis is similar to that reported by other workers. The ordinal position of the children in the family varied considerably and did not seem to be significant.

Onset

In most cases the onset of arthritis was gradual, with vague symptoms that could not be diagnosed for some time. One aspect of onset which warrants further investigation was that in some it occurred during periods known to be critical in the emotional development of the child. As shown in the table below, 10 children developed arthritis between the ages of 1½ and 3 years, when the child makes his earliest attempts to separate from the mother and become independent. During this period motor development promotes the child's getting free and moving away from the mother. Other critical phases in development are during the ages of 3 to 5 years and 10 to 12 years, onset occurring in 9 children in each group. Though other conflicts of motor, physical, and instinctual origin are usually highlighted at these times, it was our impression that in the arthritic children the struggle for separatedness and independence was accentuated.

Age	No. of children
1½ to 3	10
3 to 5	9
6 to 9	8
10 to 12	9
13 and over	4
	40

In one-third of the cases, onset correlated with an emotionally charged event. These events seemed to be precipitants rather than causes, since there was usually evidence of a long-sustained emotional conflict between mother and child prior to onset.

Recurrence

In one-fourth of the cases a recurrence or aggravation of the arthritis was related to an emotionally charged situation, often similar to circumstances at the time of original onset. In a few cases we found what is referred to as "the anniversary phenomenon", that is, the arthritis recurred during the same time of the year as when it originally began. In one case it recurred twice on exactly the same date without any known precipitants.

Concept of illness

Although in most illnesses children and parents have feelings and fantasies that are quite different from the actual nature of their diseases, fantasy explanations about arthritis were more strikingly prevalent. This may be encouraged by the fact that arthritis is a disease where much is still unknown. Whether such fantasies might influence the physiological manifestations of the disease could not be ascertained.

The mothers expressed the feeling that in some way they were responsible for the illness. Their guilt often focused on events during the pregnancy with the arthritic child, such as falls, illness, death of a relative, and depressions. The mothers felt that these events affected the child and that rheumatoid arthritis was the result.

The children also had feelings of guilt concerning the arthritis — that it was punishment for bad thoughts or bad deeds. In their fantasies the disease was frequently represented as an immobilization of, or a retaliation for, intense destructive impulses.

Mother-child relationship

One outstanding aspect of the mother-child relationship was its unusual closeness and intensity. The closeness and extreme interdependence seemed to predate the illness and then were fostered by the illness itself which set up an infantile situation where the mother has to be the arms and legs of the child. The response of the children, even the older ones, to hospitalization was marked by depressed attitudes and feelings of abandonment. For the mothers, separation from the children through hospitalization was an acutely upsetting experience. They had difficulties in accepting the medical recommendation for hospitalization, visited often and left with great difficulty, and spontaneously brought food from home — showing great need to keep possession of their children.

Another aspect of the mother-child relationship was the special feeling toward the arthritic child, in contrast to other members of the family, which seemed to predate the onset of the illness. The special feelings often related to unusual experiences during the pregnancy which had not occurred with the other children in the same family.

Personality characteristics

The mothers, in spite of many individual personality differences, had some common characteristics. They had been deeply deprived from childhood, physically and emotionally. Over half experienced the loss or threat of loss of an important relative during the pregnancy or early life of the arthritic child. There was a marked tendency to depression, exemplified in a mood of resignation and a fatalistic stoical acceptance of fate. Another outstanding characteristic was the slavish martyr-like devotion to the arthritic child. In some instances the mothers' lives were practically consumed in the care of their sick children. In other ways, the mothers demonstrated their martyr attitudes: the frequency of performing good service to others, a suffering relationship with their husbands who were often alcoholics, poor providers, chronic invalids, or cruel in their treatment of them. Also striking in these mothers was their extreme difficulty in expressing feelings, either positive or negative, even in relation to situations which would arouse a response in anyone. They also revealed the personal history of their lives very slowly.

All of the children showed a disturbance in mood, particularly in the hospital. Most of them were depressed, varying in degree from mild to those who were apathetic, immobile, unresponsive, and anorexic. Three were originally somewhat manic, becoming depressed later. The depression seemed to be the result of separation from a close mother-child unit and of inability to express their feelings. It was striking how they complained so little of pain from their illness, and how frequent the response to the question, "How are you feeling?" was "fine", "all right", and "good". The inability to express feelings was based on the attitude that feelings, both positive and negative, were dangerous. They were afraid of what they might do to others as well as what might happen to them. They had great difficulty tolerating separation from their mothers. The fantasy life of these children was of a very primitive aggressive type. It took a good bit of time for them to express their fantasies, but when they did, they were characterized by violence, devouring forces, death, and destruction.

Evaluation

From our studies it is difficult to distinguish the emotional reactions consequent to the illness from emotional factors predating the arthritis and possibly related to causation. While the consequent reactions from immobilization and hospitalization colored the picture we saw of the child, the findings in the group were consistent, regardless of the duration of symptoms and amount of hospitalization. In addition, we compared the group of arthritic children with a group of 18 children who had rheumatic fever and who were studied in our Unit by Drs. Holder, Brazelton, and Miss Talbot. Rheumatic fever offered a good comparison, since it had so many similar clinical features. However, both the mothers and children of the rheumatic fever group experienced the illness quite differently in terms of a neurotic reaction consequent to illness with marked anxiety, superficial guilt, and ideas of causation based on realistic external causes, such as infection and dampness. In contrast, the mothers and children of the arthritis group showed evidence of depression, deep guilt, and ideas of causation based on personal causes and fantasy explanations.

In juvenile rheumatoid arthritis the core emotional conflict appeared to be in the mother-child relationship where there was a struggle for separatedness. This conflict seemed to be the resultant of forces within the mother's personality and the occurrence of certain crucial events during the child's early life. The crucial event was an actual, symbolic, or threatened loss to the mother which occurred during the pregnancy or early life of the arthritic child. As a result, the mother gave to the child the feelings that belonged to the person who was lost. She also gave herself in a self-sacrificial way to the child in an attempt to recapture what she felt she had lost. The result was a very intense close mother-child relationship in which the child maintained an infantile personality structure where he was unable to achieve separatedness from her. When he tried to separate, the mother would experience it as another loss or threat of loss.

It is of interest that the emotionally charged event related to onset usually represented a loss or threat of loss, and also during the critical phases of emotional development the struggle of the child to move apart from the mother was experienced by her as a loss.

Further developments of the study

This clinical study was supported initially in 1948 by a research grant from the National Institute of Mental Health of the U.S. Public Health Service for the Study of Psychosomatic Disorders of Children. In 1953, and now in 1954, the Arthritis and Rheumatism Foundation (New England Chapter) has continued the support of our work.

In September 1954 the Unit undertook a further extension of this preliminary study, with funds from a special research grant from the U.S. Public Health Service. The plan is to apply a more systematic and reproducible method of dealing with the psychological data from interview material already obtained. Interview material from two patient populations, consisting of a research group (arthritis cases) and a control group (asthma cases), will be compared. The two groups will be matched according to a number of significant variables (age of patient, age at onset of illness, sex, number of interviews, etc.). The two groups will be compared by the use of scales that are constructed from the concrete data existing in interview material. The data upon which the clinical impressions of the preliminary clinical study were based will be selected for scaling. By this method we hope to confirm or reject in an objective way the clinical impressions of the preliminary study. We hope to determine whether certain emotional constellations common to children with rheumatoid arthritis and their parents are present in a significant number, and whether these distinguish this group from groups with other diseases.

Gaston E. Blom, M.D.,
Associate Director, Child Psychiatry Unit

FRANCIS TENNERY HUNTER

1897–1954

Frank Hunter was no ordinary doctor. At the lunch table in the MGH cafeteria, a newcomer might at first think of him as a rather peppery man whose talk was cynical, but in a moment he would be convulsed by hearing the latest story told artfully. Later he would find out that Frank Hunter had a keen mind, which enabled him to know much about many subjects and to talk about them with authority and clarity.

Frank Hunter was born in Ohio but was brought up in Florida. At the age of nineteen, in 1915, he came to Boston, ostensibly to study music, but higher education was more appealing and he passed the entrance examinations for Harvard College. In the summer of his sophomore year (1917), he went to France to drive an ambulance for the French Army. He returned to college in November, made up the lost time, and took his Harvard A.B. in 1919.

In September he entered the Harvard Medical School, where all was well until February 1920, when he developed pneumonia, followed by empyema, and for a time was seriously ill. He was sent back to Florida to recuperate. In June he came back to Harvard, this time to take courses in abnormal psychology in the Graduate School of Arts and Sciences. In January 1921, he returned to the Medical School to begin again where he had left off in the year before. That summer he worked again in the Graduate School and received his M.A. In his fourth year in the Medical School he came into contact with Dr. George R. Minot at the Collis P. Huntington Hospital and began his interest in blood. After receiving his M.D., *cum laude,* he worked with Dr. Minot at the Huntington, and his interest in hematology, as well as in tumors, and especially in leukemia, increased. In July 1925, his West Medical internship began at the Massachusetts General Hospital. At the Huntington he had met Miss Margaret Weld, younger sister of Dr. Minot's wife, and on December 17, 1925, they were married. After the internship, Drs. Minot and Locke gave him a desk at 311 Beacon Street, but his mind was much too active for the routine of clinical histories and physical examinations.

His work at the Huntington, at the new Palmer Memorial, and at the Out-Patient Department of the Massachusetts General, centered around diseases of the blood. The study of patients with leukemia, lymphoma, lymphoblastoma, and cancer gave rise to interest in x-ray, as well as to the effects of poisons. He became one of those experts who know much about a number of peculiar and rare conditions.

In four patients with severe nausea, bleeding gums, cough, and weakness, he found that their symptoms depended upon contact with benzol in their occupations, and the paper which he wrote[1] with Dr. Hanflig is one of the important articles on benzol poisoning.

In 1935 Dr. Hunter and Dr. George W. Holmes[2] studied the toxic effects of x-ray and described three types of x-ray sickness. The first is a toxic sickness with nausea and vomiting, which is due to the absorption of tumor tissue breakdown products. The second group is psychic, while the third group can be called true roentgen sickness. The authors showed that this was related to a disturbance of liver function, and that by increasing the intake of fluid and of carbohydrates before the x-ray treatment, the symptoms could be modified, if not prevented.

Hunter's paper on "Hutchinson-Boeck's disease (generalized 'sarcoidosis'): Historical note and report of a case with apparent cure"[3] was another important contribution.

In 1939 the work on benzol was continued, and three papers were published from the M.G.H. under the general title "Chronic exposure to benzene (benzol)". The clinical effects were described by Dr. Hunter.[4] Of 89 individuals exposed to benzene fumes, only 11 showed a perfectly normal blood picture. Dr. Hunter pointed out that the first signs of poisoning may not occur until they are precipitated by an infection some time later.

When the Baker Memorial Hospital was opened in 1930, Dr. Hunter was put in charge of the new clinical laboratory. Under his guidance, the standard of clinical pathology in the whole Hospital was raised to a high level.

In the *Fifteenth report of the H.M.S. Class of 1924* is this bit concerning Dr. Hunter:

"He has a fierce interest in the x-ray treatment of lymphoma, on which he is an authority.

"He has written about a dozen clinical papers and a Laboratory Manual. He is Associate Physician in charge of the Clinical Laboratories at the M.G.H. and Ten Terrified Technicians tremble at his word.

"He likes Egyptian hieroglyphics, medical history, playing the viola in Bill Breed's string quartet, and gastronomy. Several years ago he upset the Authorities at the Museum of Fine Arts in Boston by taking an x-ray of the mummy of a priestess and proving that 'she' was a man."

The *Laboratory manual of the Massachusetts General Hospital* was first published in 1922, was revised in 1928 by Drs. Roy R. Wheeler and Francis T. Hunter, and was rewritten by Hunter in 1939.[5] As for the mummy, he had a portable x-ray machine taken up to the Museum, partly to look for gold in the mummy case and partly because he also was an inquisitive physician.

The modern method by which hemoglobin is measured photoelectrically was introduced by Dr. Frank Hunter. His papers give the detailed instructions, and they explain the calculations by which the results can be transposed into grams per 100 cc. He could use the same machine to measure methemoglobin and carbon monoxide hemoglobin.

In World War II, Dr. Hunter spent over four years in the Navy. He was with Base Hospital 4 in the South Pacific from July 1942 to February 1944, and then, after three months at the Naval Hospital in Chelsea, he was made a Commander and was appointed Executive Officer in the Fargo Building, where he worked from May 30, 1944, to November 13, 1945. He was promoted to Captain on his retirement. His wife and two children were glad when he was released at last. His graphic accounts of Naval "efficiency" and some of his illustrations of "Snafu" were "as funny as a crutch".

Some years after the war, he wrote a monograph entitled *The quantitation of mixtures of hemoglobin derivatives by photoelectric spectrophotometry.*[6] One need only turn the pages of this book to realize the scholarly attitude of its author.

"With recent evidence suggesting that radiologists have a higher death rate from leukemia than their colleagues, protection . . . becomes . . . important." So begins another major contribution by Frank Hunter and his associates.[7] The paper describes the limit of safe exposure to x-ray, the hazards of overexposure, and the amount of scatter of radiation under various circumstances. Again, a series of careful observations is interpreted by curves in graphic form. This paper led to the development of the film badge — a great improvement over the dental film previously suggested. This badge was thereafter prescribed for all those doctors and technicians who might come into contact with x-rays, and the same badge was used in the radioactive laboratory. The badge alone makes the wearers conscious of the danger. It is fair to say that Dr. Hunter's work has done more than any other to protect x-ray workers from the hazards of their occupation.

A true scientist is inquisitive; also, he is accurate. One morning at Grand Rounds a resident described a tumor as being the size of an orange. Dr. Hunter asked immediately, "How big is an orange? The ones my wife bought the other day are not more than two and one-half inches in diameter, whereas those sent me from Florida last winter were at least five inches in diameter. It is important to be accurate, so that changes in the size of the tumor can be recognized."

Frank Hunter was a great lover of books. He read extensively and thoughtfully. In a patient with an intention tremor, he recognized the "Danbury shakes" as due to mercury poisoning, and that reminded him of the Mad Hatter in *Alice's adventures in Wonderland,* who had similar symptoms. A few days later he brought the little book to Grand Rounds and read aloud the section about the trial. He was much interested in the Boston Medical Library, and now there is a plan to establish a memorial to him in the Library.

He was a devoted husband and father, he was a true friend to many contemporaries, and he was an important scientist. To lose him at the height of his career is most unfortunate. His many friends miss him.

F. M. R. Jackeman M.D.

* * *

On October 15, Dr. Churchill received the degree of Doctor of Laws, *honoris causa,* from the Queen's University, Kingston, Ontario, Canada. The occasion was the Hundredth Anniversary of the Founding of the Faculty of Medicine at the University. The award reads:

"Edward Delos Churchill, surgeon and teacher of surgeons, distinguished representative of a famous school and hospital, whose innovations in surgery of the chest have added to the achievements of all who are fellow practitioners."

On October 18, the Royal College of Physicians in London awarded the Moxon Medal to Dr. James L. Gamble (*W.M.* 1912) for his contributions to medical science.

The Moxon award is presented every third year to the person who is deemed to have most distinguished himself by observation and research in clinical medicine. Among ten previous winners, only one was an American — the late Dr. George R. Minot (*E.M.* 1913).

The Board of Trustees, at their meeting on October 22, voted:

On recommendation of the General Executive Committee and Out-Patient Department Committee to change the name of the Out-Patient Department to "The Clinics of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary", this having been already approved by the Infirmary.

To promote:

Dr. Joseph W. Gardella from Clinical and Research Fellow in Medicine to Assistant in Medicine.

To extend the appointment of:

Dr. Verner S. Johnson as Assistant Resident in Orthopedic Surgery from January 1 through March 31, 1955, and to appoint him Senior Resident for one year, beginning April 1, 1955.

To appoint:

Dr. Robert C. Detwiler as Assistant Resident in Orthopedic Surgery, beginning July 1, 1955;

Dr. Robert B. McFarland as Third Assistant Resident in Pathology, beginning July 1, 1955;

Dr. Allan B. McNie as Third Assistant Resident in Pathology, beginning July 1, 1955;

Dr. Geraldine M. Peiffer as Assistant Resident in Anesthesia, beginning August 1, 1955;

Dr. John S. Robey as Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1955.

At their meetings during October, the General Executive Committee voted:

To accept with regret the resignation of Yale J. Topper, Ph.D. as Research Fellow in Biochemistry, effective as of October 2.

To promote:

Dr. William R. Buchanan, Jr. to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1955;

Dr. Robert C. Coe from the position of Assistant Resident to that of Resident in Surgery, beginning January 1, 1955;

Dr. Richard B. Kearsley to the position of Chief Resident on the Children's Medical Service for one year, beginning July 1, 1955;

Dr. Kazuo K. Kimura to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1955;

Dr. Barbara M. Orski to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1955;

Dr. Leonard H. Plotkin to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1955.

To reappoint:

Dr. John Denovian as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning December 1;

Dr. Nicholas J. Fiumara as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. Robert B. Giles, Jr. as Clinical and Research Fellow in Medicine, effective as of October 15;

Dr. Franz S. M. Herbst as Clinical and Research Fellow in Dermatology, for the period July 1 through October 31;

Dr. Mark R. Knapp as Assistant Resident in Anesthesia for one year, beginning November 19;

Dr. Raymond D. Manchester as Clinical and Research Fellow in Dermatology, as of October 1;

Dr. Maurice M. Pechet as Clinical and Research Fellow in Medicine, effective as of October 1;

Dr. Guillermo C. Sanchez as Research Fellow in Anesthesia, for a period of nine months, beginning October 1;

Dr. John T. Sharp as Clinical and Research Fellow in Medicine, effective as of December 1.

To appoint:

Miss Aileen K. Adams as Clinical Fellow in Anesthesia for one year, beginning June 1, 1955;

Dr. R. Andjus as Research Fellow in Anesthesia for one year;

Dr. William L. Bencze as Research Fellow in Medicine for one year, beginning September 29;

Earl W. Davie, Ph.D. as Research Fellow in Biochemistry, effective as of October 1;

Dr. Francis L. A. de Marneffe as Clinical Assistant in Psychiatry, for the period January 1 through June 30, 1955;

Dr. Albert C. England, Jr. as Research Fellow in Neurology, assigned to Electroencephalography, for a period of six months, beginning October 1;

Dr. Murray M. Freed as Clinical Fellow in Physical Medicine for one year, beginning January 1, 1956;

Dr. Samut Jatinandana as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. Michel Leclerc as Graduate Student Assistant in Surgery, effective as of October 1;

Dr. Kenneth J. Ryan as Research Fellow in Biochemistry for one year, beginning October 1;

Dr. John B. Vander as Clinical and Research Fellow in Medicine, effective as of October 1.

The General Executive Committee also voted to appoint the following group as Graduate Student Assistants in Medicine, assigned to Cardiology, for one year, beginning October 1:

Dr. Leandre P. Decarie, Montreal, Canada
Dr. Yves Desrochers, Montreal, Canada
Dr. Jorge A. Fernandez-Mendia, Guatemala
Dr. Arnold Fieldman, Short Beach, Conn.
Dr. Alberto Mazzoleni, Milano, Italy
Dr. R. Judson Pearson, Jr., Beaufort, S. C.
Dr. William C. Pomeroy, Jr., Los Angeles, Calif.
Dr. Chotibun Puranaveja, Dhonburi, Thailand
Dr. Raoul J. Roberge, Quebec, Canada
Dr. Donald F. Williams, Porterville, Calif.
Dr. Walter K. Yates, Huntington, W. Va.

HORMONE LABORATORY

Collis P. Huntington Memorial Hospital of Harvard University, at the Massachusetts General Hospital

The first crystalline steroid hormone, estrone, was isolated from urine just twenty-five years ago. This discovery was soon followed by the isolation of other female and male sex hormone metabolites and ultimately by the detection of steroids derived from the adrenal cortex. It was soon recognized that these substances were intimately related to normal and abnormal growth processes.

The early recognition of the interrelationships of the internal secretions to growth led in October 1935 to the establishment of the Hormone Laboratory by the late Dr. Ira T. Nathanson, then Littauer Fellow in Surgery at the old Huntington Hospital. When the Huntington Hospital closed its doors and the research laboratories moved to the Massachusetts General Hospital, the Hormone Laboratory had already made substantial contributions to the fields of cancer and endocrinology.

Observation of the effects of endocrine gland removal and steroid therapy in advanced cancer of the breast and prostate gland served to justify the establishment of the Laboratory and to emphasize the significance of this approach. This led to continuing expansion of the staff and activities of the Hormone Laboratory, which placed a strain on the physical facilities of the quarters in the Domestic Building. During this period, the remarkable observations of Kendall and Hench on the palliative effect of cortisone and ACTH in rheumatoid arthritis emphasized the central role of the adrenal cortex in disease processes not theretofore thought to be under endocrine control. These events placed an additional work load upon the staff of the Hormone Laboratory and further strained the physical facilities. This pressure was relieved when the Laboratory moved to its present location in the Research Building.

The principal activity of the Hormone Laboratory centers about the study of errors in steroid metabolism in neoplastic disease. In developing a unified approach to this problem it has been necessary to devote much time and effort to devising methods for the separation, identification, and quantitative analysis of individual components of very complex mixtures. We have availed ourselves of the latest advances in techniques, such as chromatography, counter-current distribution, and finally that most powerful tool, infrared spectroscopy. The methods now available permit us to develop a broad picture of the quantitative changes in steroid excretion patterns which occur as a result of disease, endocrine gland removal, and steroid and pituitary hormone administration. The Hormone Laboratory has always derived its strength from the intimate relations of the Laboratory, the Clinic, and the Metabolic Ward. The continuing interchange of ideas and data has helped to bridge the gap and should be increasingly fruitful in improving our understanding of this important area and thus lead to better and more effective care of patients.

The activities of the Hormone Laboratory have always extended beyond the confines of the Huntington Laboratories to collaboration with other groups within and outside the Hospital. Collaborative projects with the Departments of Surgery and of Gynecology have been in progress for some time. More recently a project on steroid biosynthesis and metabolism, using radioactive compounds, was begun with the group at the Worcester Foundation for Experimental Biology.

Clearly, this extensive program could not have been undertaken without a highly skilled, devoted, and loyal staff to whom great credit is due for past accomplishments and on whom we count heavily for future achievement.

Lewis L. Engel, Ph.D.,
Head of Hormone Laboratory

* * *

Brief bits:—

Dr. Dana L. Farnsworth (*W.M.* 1935), Associate Physician on our staff, has been appointed the Henry K. Oliver Professor of Hygiene at Harvard University. Until this recent appointment, Dr. Farnsworth has been serving as the first full-time medical director at Massachusetts Institute of Technology. In his new position he will direct all medical care at Harvard. He succeeds Dr. Arlie V. Bock (*W.M.* 1917), a member of our Board of Consultation, who retired from Harvard this year, after about thirty years of service.

Dr. Amasa B. Ford (*M.* 1950) announces the opening of his office in the Benjamin Rose Hospital, 2073 Abington Road, Cleveland 6, Ohio, for the practice of Internal Medicine.

Dr. Earl A. Glicklich (a. *D.*) announces the opening of his office at 403 Commonwealth Avenue, Boston, for the practice of Dermatology.

Dr. John B. Kinmonth (clin. & res. fel. *S.* 1949) has been appointed Professor of Surgery at St. Thomas's Hospital in London. Dr. Kinmonth trained at St. Thomas's, but has recently been on the staff at St. Bartholomew's Hospital.

Dr. J. Gordon Scannell attended the New England Postgraduate Assembly meeting on October 25. With Dr. Gordon S. Myers, he presented a paper on "Correctable congenital cardiac disease".

Dr. William R. Waddell spoke at the New England Postgraduate Assembly in October, with Dr. Frederick J. Stare. Their subject was "Application of recent nutrition researches to specific medical problems of general practice".

MASSACHUSETTS EYE & EAR INFIRMARY

The regular fall meeting of the New England Oto-Laryngological Society was held on Wednesday, November 17, in the Upper Amphitheatre of the Eye and Ear Infirmary. Dr. LeRoy A. Schall presided at the morning Clinical Conference, and Dr. Charles I. Johnson led the afternoon meeting. The last speaker of the afternoon was Mr. George A. McLaughlin, Boston attorney and Infirmary Corporation member, who talked on estate management.

The 420th meeting of the New England Ophthalmological Society was also held at the Infirmary on November 17. Staff members participated in the daytime sessions, and the evening lectures were given by Dr. Hugh C. Donahue, also of the Eye and Ear staff, and Dr. Walter S. Atkinson of Watertown, New York, who was the guest speaker.

The annual meeting of the Infirmary will be held on December 8, rather than in February as has been the custom, in order that it may follow more closely the change in the fiscal year. The election of officers and the appointment of staff members for the coming year will be the principal business of the meeting.

Dr. John A. Renner of Youngstown, Ohio, is spending six months at the Infirmary, observing in the clinics, operating rooms, and wards of the ENT Service.

Dr. Bernard Zeavin has been appointed Assistant in Ophthalmology; Dr. Alexander S. Macmillan, Jr., now at the Peter Bent Brigham Hospital, has received an appointment as Assistant Roentgenologist; and Dr. Mahlon B. Hoagland replaced Dr. Robert L. Berg as Secretary of the Infirmary's Research Committee when the latter's resignation became effective this fall.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor considerable unnecessary time and trouble when you fail to include it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Dermatology

Burke, R. C., Swartz, J. H., Chapman, S. S., and Huang, W. Y.
Mycoticin, a new antifungal antibiotic. 1. Preliminary paper.
J. Invest. Dermat. 23: 163-168.

General Surgery

McDermott, W. V., Jr., Adams, R. D., and Riddell, A. G.
Ammonia metabolism in man.
Ann. Surg. 140: 539-556.

Speare, G. S.
Staphylococcus pseudomembranous enterocolitis, a complication of antibiotic therapy.
Am. J. Surg. 88: 523-534.

Neurology, Neurosurgery, and Psychiatry

Cogan, D. G., and Barrows, L. J.
Platybasia and the Arnold-Chiari malformation.
A.M.A. Arch. Ophth. 52: 13-29.

Otolaryngology

Kelemen, G.
Histological test of tonsillar activity.
In Memoria, IV Congreso Panamericano de Otorrinolaringologia y Broncoesofagologia, Mexico, 1954, pp. 413-414.

Reed, G. F.
Ventriculomastoidostomy: Its significance to the otologist.
Ann. Otol., Rhin. & Laryng. 273-277.

♣ ♣ ♣

CARDIAC CATHETERIZATION LABORATORY

The development of surgical techniques for the amelioration or correction of congenital and acquired cardiovascular diseases, particularly during the past ten years, created a need for more accurate methods of diagnosis. Cardiac catheterization, first performed by Forsmann on himself in 1929, was later employed by Cournand to measure the cardiac output in man and was further developed as a diagnostic procedure, especially by Cournand, Bing, and Dexter.

The first cardiac catheterization studies at the Massachusetts General Hospital were carried out in a small room in the basement of the Bulfinch Building in 1945 on a group of eight patients with neurocirculatory asthenia by Drs. Mandel Cohen and William Bridges. The investigation concerned measurement of the cardiac output, which was also estimated by a dye technique and ballistocardiography. Thereafter, Bill Bridges attempted several diagnostic studies of patients with congenital heart disease but, in view of the limited facilities then available, eventually discontinued the program to turn to other work.

The present cardiac catheterization laboratory was brought into being through the efforts of Dr. Paul White and Dr. Bland and made possible by a gift from the late Mrs. Theodore Brown who provided for the cost of construction. Since the laboratory required a fluoroscope and other x-ray equipment, Hospital policy dictated that it be set up on White 2 within the x-ray department and under its supervision. The space and equipment have been made available for other research activities, including Thornton Brown's studies on motility of the spine, Bill Chapman's investigation of the effects of drugs on the gastrointestinal tract, and x-ray department studies directed by Milford Schulz concerning radium dosimetry and other physical problems. The laboratory has also been useful for cerebral angiograms, arteriograms, and angiocardiograms. Equipment for the laboratory has largely been provided by grants from the National Heart Institute of the U.S. Public Health Service.

Cardiac catheterization studies were again taken up in the new laboratory in 1948. By this time Bill Bridges had left for Seattle and the team consisted of Gordon Scannell, Stanley Wyman, John Hurst, and E. Grey Dimond, in addition to the author. We have been extremely fortunate in having Miss Ann Murphy with us from the beginning — at first through the kindness of Dr. Beecher, since she was then a full-time member of his department. Not only has Miss Murphy been an apparently tireless and completely accurate technician, she has also devoted much time and effort to teaching many of our graduate students and visitors and working out new techniques for the laboratory.

During the past six years we have been supported by a grant from the National Heart Institute and helped by many members of the x-ray department and several residents and postgraduate students in the cardiac department, particularly Drs. Allen Barbour, Thomas Mattingly, James O'Neill, Pier Curti, and Goodman Cohen. Dr. Ernest Craige, until he joined the University of North Carolina in 1951, and Allan Friedlich since that time have, with Gordon Scannell and the author, completed several studies directed toward a more complete understanding of pulmonary hypertension in congenital and acquired heart disease. These include investigations of the hemodynamic effects of protoveratrine on patients with systemic hypertension with and without congestive heart failure, the significance of pulmonary hypertension in constrictive pericarditis, respiratory and circulatory abnormalities in patients with mitral stenosis before and after surgery, and the physiologic variables encountered in patients with congenital heart disease with pulmonary hypertension. In recent years there has been an increasing demand for cardiac catheter study of patients in the Hospital for diagnostic work-up where cardiac surgery may be indicated. Although such

BREAKING GROUND, NOVEMBER 8, FOR THE NEW MEDICAL SCIENCE BUILDING, WHICH WILL HOUSE THE LABORATORIES AND OFFICES OF THE DEPARTMENTS OF PATHOLOGY, DERMATOLOGY, NEUROLOGY, AND PSYCHIATRY.

Left to right: Mr. Henry R. Shepley (of Shepley, Bulfinch, Richardson, and Abbott, Architects), Dr. George P. Berry (Dean of Harvard Medical School), Dr. Benjamin Castleman (Chief of Pathology Department), Mr. Francis C. Gray (Chairman of our Board of Trustees), Mr. Ralph Lowell (Trustee), Mr. Theodore Chase (Member of our Corporation), and Dr. Dean A. Clark (General Director)

studies have not answered all the diagnostic questions, particularly where there is disease on the left side of the heart, we expect that clinical problems will occupy an increasing amount of time in the future. The recent acquisition of a new angiocardiographic machine capable of taking very rapid x-ray films in two dimensions simultaneously will allow us to carry out combined catheter-angiographic studies and, with the help of Dr. Wyman, we may expect to gain much useful information as to the aortic and mitral valves and the left ventricle.

At present, catheterization studies are carried out twice each week, with an evening conference each Wednesday for analysis of the data. Each one of the twelve graduate students in the yearly course of the cardiac department is assigned to the laboratory for a month, and several of these students have since set up cardiac catheterization laboratories in teaching centers in their own countries. The laboratory experience is supplemented by a weekly teaching exercise, during which emphasis is placed on the limitations of the technique, and the importance of interpreting the data with respect to the clinical problem and all the available information about the patient. It is felt that these laboratory and conference periods have become an essential part of our teaching program.

The technique of cardiac catheterization permits right atrial and intraventricular electrocardiography, and by making available venous blood from the heart, liver, and kidneys, is also helpful in studying the circulation and metabolism of these organs. Although it is a rather cumbersome procedure, there is at present no indication that it will soon be supplanted by other techniques capable of giving the same information.

Gordon S. Myers, M.D.,
Head of Cardiac Catheterization Laboratory

VOLUNTEER GROUPS

MGH STAFF WIVES HOSPITAL COMMITTEE

The following officers have been elected for the 1954–55 fiscal year:

EXECUTIVE BOARD

Chairman	Mrs. Oliver Cope
Vice-Chairman	Mrs. Howard Ulfelder
Secretary to the Board	Mrs. Grant V. Rodkey
Corresponding and Recording Secretary	Mrs. E. Peirson Richardson
Treasurer	Mrs. Charles L. Short
Hospitality	Mrs. Raymond D. Adams
Special projects	Mrs. Richard H. Sweet
Volunteer Service	Mrs. Charles B. Burbank
Music	Mrs. Milford D. Schulz

COMMUNITY CHAIRMEN

Belmont	Mrs. Claude E. Welch
Cambridge	Mrs. Robert N. Ganz
Boston	Mrs. Richard G. Whiting
Brookline	Mrs. Benjamin Castleman
Chestnut Hill	Mrs. John Homans, Jr.
Dedham	Mrs. Edward Hamlin, Jr.
Milton	Mrs. William C. Quinby, Jr.
Newton	Mrs. James H. Currens
Lincoln, Weston, Watertown, Waltham	Mrs. Perry J. Culver
Lexington, Concord	Mrs. Alexander Leaf
Winchester, Arlington, Stoneham	Mrs. Laurence L. Robbins

DISTAFF CLUB

The Distaff Club held its first fall meeting on October 15. Plans for the coming months were discussed and the following officers were elected:

President	Mrs. Stephen M. Krane
Vice-President	Mrs. Bernard B. Stone
Secretary	Mrs. Jens G. Rosenkrantz
Treasurer	Mrs. Alfred J. Luessenhop

Our Ether Day observance was held again this year in the Moseley Rotunda, with Dr. Dean A. Clark presiding.

The program opened with words of greeting from Mr. Henry R. Guild, a member of our Board of Trustees and Treasurer of the Massachusetts General Hospital Corporation.

Then followed the presentation to the Hospital of a portrait of Dr. Augustus A. Gould, who was one of those present in our Ether Dome at the first public demonstration of the use of ether for major surgery on October 16, 1846. The presentation address was made by Mr. Horace Gooch of Louisville, Kentucky, grandson of Dr. Gould. The several descendants of Dr. Gould who were present for the ceremony had been entertained at a special luncheon which preceded the afternoon events.

The musical portion of the program was the rendition of the Beethoven Sonata No. 5 in F major, for violin and piano, played for us by Helen Teschner-Tas, violinist, with David Bacon at the piano.

Then came the awarding of Service Pins by Dr. Clark — a feature that has come to be associated with our annual observance of Ether Day. These pins are presented each year to members of both the professional and non-professional groups, in recognition of continuous years of loyal service. Nearly 100 pins were presented to individuals who had served the Hospital continuously for 5 years, 34 were presented for 10 years of service, 8 for 20 years, 9 for 25 years, 4 for 30 years, and 2 members of the Hospital family — Nancy Fraser, R.N., and Sara F. MacPherson — received pins indicating 40 years of service.

Since our traditional observance of Ether Day fell this year within the week proclaimed by President Eisenhower as National Nurse Week, Dr. Clark gave special recognition to this designation by presenting citations to representatives of the Professional Nurses and the Licensed Practical Nurses. The text of the citation reads:

> It is most fitting on Ether Day that we join with others throughout the United States in paying tribute to the nursing profession for its great contribution to the welfare and security of the people of our Nation.
>
> Here at the Massachusetts General Hospital, we wish to express particular appreciation to the Professional Nurses and the Licensed Practical Nurses in this Hospital who, by their selfless devotion to their chosen profession, contribute immeasurably to the care of our patients.

The citations were signed by Dr. Clark.

Refreshments were served in the East Dining Room after the ceremonies.

* * *

New addresses:—

Dr. William M. Crowell (a. psychiat. *McL.*), 32 Pierce Rd., Watertown, Mass.
Dr. James M. Doonan (clin. a. *S.*), 1101 Beacon St., Brookline, Mass.
Dr. Albert J. Finck (a.r.p. *N.* 1949), Beth Israel Hospital, Boston 15, Mass.
Dr. James A. Halsted (*W.M.* 1932), Wadsworth Veterans Administration Hospital, Los Angeles 25, Calif.
Dr. Robert J. Vitt (a.r.s. *Or.* 1951), 793 North Cherry Ave., Tulare, Calif.

THE NEWS

1811

No. 141 Boston, Mass. January 1955

MASSACHUSETTS EYE & EAR INFIRMARY

Feby 23 1827

DEVELOPMENTS ON THE OPHTHALMOLOGICAL SERVICE

In spite of the tendency of the number of clinic patients everywhere to decrease, due to the growth of voluntary insurance plans and good industrial employment, the Eye Clinic has held up remarkably well. Although we do not have the great hoards of patients like those of the 1930's, we still remain the leading OPD clinic in point of numbers, and the recent tendency to decrease has been halted. Thus, a good supply of teaching material for residents and medical students is always available. The effectiveness of the Eye Clinic is enhanced by the attendance of the Chiefs of Service, as well as all other staff members, on regular days throughout the year. This, we believe, is a better plan for complete follow-up of patients than having separate staffs for the O.P.D. and for the house.

The resident staff consists of nine men, who enter the Infirmary at stated periods throughout the year (one every three months) and progress upward through various grades of responsibility. This vertical arrangement has been in vogue here for many years and has worked so well that we see no good reason to change to the customary horizontal type. The residency, which is twenty-eight months in length, is preceded by the five-month Basic Science Course in Ophthalmology at the Harvard Medical School. Throughout the year, the resident group receives a course of lectures at the Infirmary, given by various members of the staff and by visiting ophthalmologists. On Wednesday afternoons, they make rounds with the Chief of Ophthalmology, during which every patient is seen and discussed.

Another new development in staff organization has been the staff dinner meetings. These are held three times a year at the Club Dining Room at Vanderbilt Hall, and are well attended by the visiting staff. In addition, the Director of the Infirmary and the President of the Board of Managers are present, and an opportunity is given everybody to ask questions about hospital plans and make suggestions for improvements. At one of these meetings three years ago, the staff voted to use the fees that had accumulated from Blue Shield patients cared for in the wards for a post-residency scholarship to enable some young ophthalmologist to do investigative work at the Infirmary for a year. This money is invested by the Infirmary and now amounts to $87,000. When the fund reaches $100,000, the Frederick H. Verhoeff Fellowship will be created in honor of our Consulting Chief of Ophthalmology.

The weekly clinical conferences, at which residents present interesting cases, are well attended by the staff and by a number of visiting ophthalmologists from other institutions.

One of the great advantages of the residency is its close association with the various services at the Massachusetts General Hospital. Each resident spends three months of full time on the MGH Neurological Service, where he does perimetry, makes neurological rounds, and follows neurosurgical cases. In view of the close association between neurology and ophthalmology, this is an invaluable experience for him and, we hope, is helpful to the Neurological Service.

Another resident answers all eye consultations on the MGH wards. Thus, he has the advantage of seeing the integration of ophthalmology and general medicine—an association he must never forget.

Our children's ward is looked after by an MGH pediatric resident, whose close association with our residents is invaluable.

One of the big developments in recent years has been the growth of the Retina Service. This service was organized in 1948 under the direction of Dr. Charles L. Schepens. All cases of retinal detachment are sent there for special study prior to surgery. During the past year, 720 patients were completely worked up, of whom 468 were operated upon. Due to Dr. Schepens's tireless energy, new diagnostic tools have been devised, including a special type of binocular ophthalmoscope. These tools make for more accurate localization of the retinal tears, so that the difficult surgical procedures of sealing them up are attended with greater success. The cure of retinal detachment has always been difficult. To illustrate—twenty-five years ago the crude surgical procedures then in vogue were attended by less than 5% success. The percentage of success gradually rose, until, by World War II, it was about 50%. Recent statistics from Dr. Schepens's clinic show it to be 70%. Because of the increasing number of retina patients coming to the hospital from outside of Boston, it became necessary to enlarge the quarters of the Retina Service. New construction, extending out over the admitting area from the Eye Clinic, was begun last year, and the Retina Service is now housed in air-conditioned quarters much larger than their former accommodations. Each resident spends three months here learning how to use the special diagnostic instruments, assisting in surgery, and caring for the patients postoperatively. In addition to Dr. Schepens, Dr. Ichiro D. Okamura and Dr. Robert J. Brockhurst are on the permanent staff, and Dr. Silvio Von Pirquet of Vienna is on a one-year fellowship, given by the Retina Foundation.

The Eye Pathology Department has been reorganized since the retirement of Dr. Parker Heath last July. Dr. David G. Cogan has been appointed Director of the Laboratory, and Dr. Taylor R. Smith and Dr. Toichiro Kuwabara as Assistant Pathologists. Each resident spends three months in this laboratory. Dr. Smith conducts monthly pathology conferences at the meetings of the New England Ophthalmological Society.

To attempt to describe research activities at the Infirmary since the War would require a separate article. Brief mention will be made here of the four chief ones, and it is hoped that each will be the subject of a special report at a later date.

The Howe Laboratory of Ophthalmology is conducting both basic and clinical research of great importance. Dr. David Cogan and Dr. Toichiro Kuwabara are investigating fat formation in the cornea. Dr. W. Morton Grant and Dr. Robert R. Trotter are continuing their important work on glaucoma, with special reference to the outflow of aqueous from the anterior chamber of the eye. Dr. David D. Donaldson has perfected a stereoscopic camera for photographing the angle of the anterior chamber and correlating the findings with the clinical conditions. His exhibit at the Academy of Ophthalmology and Otolaryngology received the Blue Ribbon Award.

The Retina Foundation is also doing important basic research, particularly on the vitreous. Dr. Endre A. Balazs's activities cover two different fields—namely, biochemistry and tissue culture. In biochemistry, Dr. Balazs is studying the chemical structure and formation of the vitreous body. With Dr. Claes-Henrik Dohlmann, he has done a chemical investigation of Descemet's membrane and of the corneal stroma. In the tissue culture field, Dr. Balazs is studying the effect, *in vitro*, of mucopolysaccharides upon the mitosis and migration of fibroblasts; he is also investigating the biosynthesis of hyaluronic acid with the help of radioactive isotopes. Dr. Marie A. Jakus is studying the fine structure of eye tissues with the electron microscope; she is currently investigating the animal and human cornea, the sclera, and the lens. Dr. Lazlo Varga is investigating the physiochemical properties of the vitreous gel. Dr. Arthur F. Howe is studying the effect of electro-magnetic radiation on the vitreous body.

Dr. William Stone, Jr. is continuing his interesting work on the plastic cornea and on the integrated postenucleation implant.

Dr. Merrill J. King, Dr. Julian F. Chisholm, Jr., and Dr. Leona Zacharias have been studying the epidemiology of retrolental fibroplasia at the Boston Lying-in Hospital, with the collaboration of Dr. William E. Reynolds of the Department of Preventive Medicine, Harvard Medical School. It appears there may be other factors besides excessive oxygen in the etiology of this disease, which blinds so many premature infants.

The sterilization and preservation of ophthalmic solutions has been the subject of a combined study by the Bacteriology Laboratory of the Infirmary and the Pharmacy. Mr. John T. Murphy, Head of the Pharmacy Department, investigated the conditions under which ophthalmic drugs will withstand degradation after autoclaving, when they are kept for a year or more.

Dr. Henry F. Allen and Miss Anita Mangiaracine, our Bacteriologist, made a comparative study of the antibacterial properties of several substances used as preservatives for eye solutions. In a series of well-controlled experiments, they found that chlorobutanol 0.5%, introduced at the Infirmary by Mr. Murphy twenty-five years ago, was still the best.

Finally, a survey of all bottles of medications currently in use at the Infirmary was undertaken. Of the 576 bottles tested, only one showed bacterial contamination.

Public interest in the Eye Bank has steadily increased, partly because of our film "Eyes of service", which has been shown to numerous clubs and organizations. This film was made possible by a donation from the Junior League of Boston. Sixty hospitals throughout New England are now affiliated with this program and supply eyes enucleated shortly after death from donors who die in these hospitals. During the year, eighty eyes were received, of which twenty-six were used for corneal transplantation and fifty-four for research purposes.

Edwin B. Dunphy, M.D.,
Chief of Ophthalmology

An award was presented to Dr. Varaztad H. Kazanjian, "in recognition of his outstanding and distinguished contribution to the art and science of oral surgery . . .", by the American Society of Surgeons, at their conference in Florida on November 5. Dr. Kazanjian was the Chalmers J. Lyons lecturer at this conference, and spoke on "Fifteen years of oral surgery". Following the lecture, Dr. Carl Waldron, Professor Emeritus of Oral Surgery at the University of Minnesota, gave a biographical sketch of Dr. Kazanjian's life and presented the award —a bronze scroll—the first such award to be given.

The next evening, at a reception, Dr. Kazanjian was made an honorary member of the Chalmers J. Lyons Academy of Oral Surgery — a society made up of membership from the University of Michigan.

Three members of the Infirmary's staff participated in the Clinical Congress of the American College of Surgeons, held at Atlantic City from November 15 through 19. At the Session on Otolaryngology, Dr. Daniel Miller presented a paper entitled "Cancer of the nasopharynx". During Sessions on Ophthalmology, Dr. Brendan D. Leahey collaborated in a panel discussion of "Surgical management of diseases of the cornea", and Dr. Paul A. Chandler collaborated in a panel discussion of "Selection of operative technique in retina separation".

The 421st meeting of the New England Ophthalmological Society was held at the Infirmary on December 15. The operating clinic and presentation of cases were followed by an afternoon pathology conference conducted by Dr. Taylor R. Smith. In the evening Dr. William Stone, Jr. spoke on "The method for removal of large retrobulbar cavernous hemangioma". The guest speaker was Dr. Peter C. Kronfeld of the Illinois Eye and Ear Infirmary, who spoke on "Functioning and non-functioning blebs".

Dr. LeRoy A. Schall, Chief of Otolaryngology, participated in a symposium on "Management of cancer of the larynx", at the meeting of the New York Cancer Society, held at the New York Academy of Medicine on December 7.

Mr. A. B. Nutt, noted ophthalmic surgeon from Sheffield, England, visited last month at the Infirmary. Mr. Nutt had just completed a month of lectures, demonstrations, and operations in Australia, and was returning to England. He gave a lecture for the residents and staff on December 10.

Another visitor last month was Dr. Luis Navas, a former resident at the Infirmary, who stopped here to visit and observe while traveling from England to his home in Nicaragua.

Mr. Alan S. Feldman, Speech Pathologist and Audiologist of the Winthrop Foundation, and Mr. Robert L. Berk, Educational Psychologist of the Foundation, are giving a course this year in "The nature, management, and special education of exceptional children", at Northeastern University College of Education.

Mr. Feldman is also giving a course in "Hearing testing" at the Winthrop Foundation. This 12-week course deals with the techniques and principles of hearing testing, and the understanding of hearing losses. It is given primarily for nurses or secretaries in doctors' offices, with the purpose of training them so that they may be able to give hearing tests themselves.

The Editor of THE NEWS has been given the following information, revising and supplementing the account of the Seventeenth International Congress of Ophthalmology which was sent to us for our October NEWS:

> At the International Congress of Ophthalmology, held in New York City from September 12 to 17, members of the Staff of the Retina Foundation organized a symposium on the vitreous body. The following papers were read:
>
> "Aspects of the physiology of the vitreous body", by Charles L. Schepens, M.D.; "Structure of the vitreous gel", by Endre A. Balazs, M.D.; "Physico-chemical properties of the vitreous body", by Laszlo Varga, Ph.D.; and "Effects of irradiation on the vitreous body", by Arthur F. Howe, Ph.D. In addition to this symposium, a paper was read on "The fine structure of the cornea", by Marie A. Jakus, Ph.D., Associate at the Retina Foundation.

* * *

THOMAS DUCKETT JONES

1899-1954

T. Duckett Jones died November 22, 1954, at the Johns Hopkins Hospital, at the age of fifty-five, of diffuse vasculitis and malignant hypertension. He was born in Petersburg, Virginia, and was a descendant of a colonial family long distinguished in medicine. His father was a physician, his brother is a surgeon, a sister is a physician, and two other sisters are married to physicians. He graduated from the Virginia Military Institute in 1919 and received his medical degree from the University of Virginia in 1923, where he served as intern and resident. In 1925 he was a Dalton Fellow and cardiac resident at the Massachusetts General Hospital, and thereafter spent a year as a National Research Council Fellow with Sir Thomas Lewis at University College Hospital in London. In 1928 he came to the House of the Good Samaritan in Boston and organized the clinics and the research department, which he directed for the next twenty years. During this period he was also an active member of the Harvard Medical School faculty and of the staff at the Massachusetts General Hospital where, under Dr. Paul D. White's supervision, he inaugurated and developed the rheumatic fever clinic. As a result of his many and important contributions, he became recognized internationally as an authority on this disease. In 1947, because of his eminence in the field, he was asked to become the medical director of the newly established Helen Hay Whitney Foundation in New York City. It was with great reluctance that he gave up his active research career in Boston, but the realization of the opportunity offered by his new duties to further the control and prevention of the disease to which he had devoted his life left him no alternative. In addition to his many responsibilities in this connection, he was a vice-president of the American Heart Association and chairman of the association's Council on Rheumatic Fever, president-elect of the National Health Council, president of the Protein Foundation, chairman of the Committee on Plasma Fractionation and Related Processes at the Laboratory of Physical Chemistry at Harvard University, and an original member of the Advisory Council of the National Heart Institute.

Duckett Jones was in many ways an unusual person. His deep loyalty to his friends, to his associates, and to his profession was his religion. His life was devoted to the conquest of rheumatic fever, and through his own efforts and those of countless others whom he inspired he well knew that victory was near at hand. His last important public appearance was as chairman of an international panel on rheumatic fever at the Second World Congress of Cardiology in Washington in September. It was shockingly evident to his friends at that time that he was seriously ill, but only upon their insistence did he finally seek medical aid. He lived only two months longer, but to the end it must have been a source of deep satisfaction to him to know that the studies he started a quarter of a century ago and the interest he inspired in others elsewhere had played such a significant role in the progress made during the intervening years. In Boston alone there remain 3,000 patients who recall with gratitude and affection his careful and kindly guidance through childhood rheumatism at the House of the Good Samaritan and the Massachusetts General Hospital.

His was truly a dedicated life.

dward F. Bland, M.D.] E. F. B.

❧ ❧ ❧

Dr. Carl Binger, who has joined our Staff as Consulting Visiting Psychiatrist, needs no introduction to anybody. However, since there may be interesting details concerning Dr. Binger's professional career with which a few may not be acquainted, we give you this release which was sent to us from the Office of Publicity at Radcliffe College:

Dr. Carl Binger has been appointed lecturer on psychiatry at the Harvard Medical School and consulting visiting psychiatrist at the Massachusetts General Hospital.

Dr. Binger, who is particularly interested in the problems of mental health in relation to education, has also been appointed psychiatric consultant to the medical staff of Radcliffe College. He will participate in the Radcliffe Seminars, an adult education program at the graduate level offered to women in the Greater Boston area. The title of his seminar is "The history of psychiatry".

Dr. Binger was graduated from Harvard College in 1910 and from the Harvard Medical School in 1914. He interned at the Massachusetts General Hospital. He was formerly associated with the Rockefeller Institute for Medical Research, and until recently practised psychiatry in New York City, where he was on the faculty of the Cornell University Medical College and on the visiting staff of the New York Hospital.

He is editor-in-chief of "Psychosomatic Medicine" and is a fellow of the New York Academy of Medicine and of the American Psychiatric Association and a member of other learned societies. His publications include: *The doctor's job, Personality in arterial hypertension,* and *More about psychiatry.*

A former resident of New York City, Dr. Binger now lives at 21 Lowell Street, Cambridge, Massachusetts.

It is possible that Dr. Binger may be less well known for his poems. We, personally, have for many years been delighted when we could find a Binger verse in any publication. Therefore, we felt highly honored when we asked for and were given permission by Dr. Binger to include this hitherto unpublished poem of his in THE NEWS.

THE MOUND

(Marlborough School)

This flinty stone, this rib and bone of England
Came from "The Mound",
The hallowed ground, where Merlin lies entombed.
Could but the mind, 'ere eyes grow dim and rheumed,
Hold fast its past,
And like this stone, with surface polished
Reflect its gods, remote but undemolished:
Romans, Scholars, Kings, and Boys,
Once living hosts, now faded toys,
Chalky ghosts who walk on Marlborough Downs
Trailing their ancient glories and their gowns.

❧ ❧ ❧

While attending the last meeting of the Pan Pacific Surgical Association, in Honolulu in October, where he was asked to present a paper, Dr. Arthur W. Allen was elected President of the Association for a three-year term of office.

On November 20, on the occasion of the celebration of the 75th Anniversary of the Philadelphia Academy of Surgery, Dr. Allen was made an Honorary Fellow of the Academy of Surgery. On this same occasion, Dr. Frederick A. Coller (*W.S.* 1914), Professor of Surgery at the University of Michigan, was also given an Honorary Fellowship.

Dr. Allen left on December 20 for Midland, Texas, where both he and Dr. Coller took part in a program of the Midland Diagnostic Cancer Clinic on the evening of the 21st. This was incidental to their both spending the holiday season with their children, who now reside in Midland.

The Board of Trustees, at their meetings during November and on December 3, voted:

To approve the arrangement whereby Dr. Raymond D. Adams will act as Consulting Neurologist at Lemuel Shattuck Hospital; and to authorize the creation of an extra Assistant Residency in Neurology, so that one such Assistant Resident shall always be on duty at Lemuel Shattuck Hospital.

To reappoint:

Dr. Gordon L. Brownell as Associate Physicist in Medicine, for the three-year period ending December 31, 1956;

Dr. Jerome Gross as Associate Biologist in Medicine, for the three-year period ending December 31, 1956;

Dr. Roger W. Jeanloz as Associate Biochemist in Medicine, for the three-year period ending December 31, 1956.

To appoint:

Dr. Miriam W. Carmichael as Assistant Resident in Neurology, beginning July 1;

Dr. Martin R. Coles as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Chester J. Dexter as Clinical Associate in Surgery, as of November 1, 1954;

Dr. G. Richard Dickersin as Third Assistant Resident in Pathology for one year, beginning July 1;

Dr. James F. Donovan as Assistant Resident in Orthopedic Surgery, beginning October 1;

Dr. G. Lynde Gately as Clinical Associate on the Children's Medical Service;

Dr. Thomas H. Green, Jr. as Assistant in Surgery, as of November 1, 1954;

Dr. Lowell P. Hager as Assistant Biochemist, effective as of September 1, 1954;

Dr. Robert H. Hansen as Assistant Resident in Anesthesia for one year, beginning October 1;

Dr. Wayne M. Hebertson as Assistant Resident in Neurology, beginning July 1;

Dr. John H. Knowles as Resident in Medicine, beginning September 1;

Dr. Vasilios G. Letsou as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. Edward C. Parkhurst as Assistant Resident in Urology for one year, beginning July 1;

Dr. Russell E. Randall as Assistant Resident in Medicine, beginning July 1;

Dr. Francoise J. Robert as Assistant Resident in Pathology, assigned to Neuropathology, beginning July 1;

Dr. Richard L. Sidman as Assistant Resident in Neurology, beginning July 1;

Dr. Marvin D. Siperstein as Assistant Resident in Medicine, beginning April 1;

Dr. William P. Smith as Resident in Medicine, beginning January 1, 1956;

Dr. William A. Tisdale as Resident in Medicine, beginning July 1;

Dr. Sumner I. Zacks as Intern in Pathology for one year, beginning July 1.

At their meetings on October 6, November 3, 17, 24, and December 1, the General Executive Committee voted:

To extend Dr. Allan St.J. Dixon's leave of absence to January 31.

To promote:

Dr. David W. Allen from the position of Intern to that of Assistant Resident in Medicine for one year, beginning October 1;

Dr. Frank K. Austen from the position of Intern to that of Assistant Resident in Medicine, beginning July 1;

Dr. Gerald M. Edelman from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Lamont W. Gaston from the position of Assistant Resident to that of Resident in Medicine for one year, beginning January 1, 1956;

Dr. Robert B. Giles, Jr. from the position of Clinical and Research Fellow to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Jan Koch-Weser from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Glenn A. Langer from the position of Intern to that of Assistant Resident in Medicine, beginning July 1;

Dr. William E. Lassiter from the position of Intern to that of Assistant Resident in Medicine, beginning July 1;

Dr. Donald B. Martin from the position of Intern to that of Assistant Resident in Medicine, beginning July 1;

Dr. Lot B. Page from the position of Assistant Resident to that of Resident in Medicine for one year, beginning October 1;

Dr. Katharine E. Spreng from the position of Intern to that of Assistant Resident in Medicine, beginning October 1;

Dr. Oscar E. Starobin from the position of Intern to that of Assistant Resident in Medicine, beginning July 1;

Dr. Pindaros R. Vagelos from the position of Intern to that of Assistant Resident in Medicine, beginning July 1;

Dr. Henry deF. Webster from the position of Assistant Resident to that of Resident in Neurology, beginning July 1;

Dr. Thomas J. Whitfield, III, from the position of Intern to that of Assistant Resident on the Children's Medical Service for one year, beginning January 1;

Dr. Ralph C. Williams, Jr. from the position of Intern to that of Assistant Resident in Medicine, beginning July 1;

To reappoint:

Mr. Alden V. Loud as Research Fellow in Medicine for one year, retroactive to July 1, 1954;

Dr. Henning Pontoppidan as Assistant Resident in Anesthesia for one year, beginning December 7, 1954;

Norman M. Prentice, M.A. as Research Fellow in Psychology, effective as of October 1, 1954;

Gershen Rosenblum, M.A. as Research Fellow in Psychology, for the period October 1, 1954 through January 31, 1955;

Dr. Clarival doP. Valladares as Graduate Student Assistant in Pathology, for the period December 1, 1954 through October 31, 1955.

To appoint:

Dr. Philippe Benda as Clinical and Research Fellow in Neurosurgery for one year, beginning January 1;

Dr. John L. Cain as Clinical Fellow in Radiology, beginning July 1;

Dr. Federico G. Cayco as Graduate Student Assistant in Surgery for one year, beginning November 15, 1954;

Dr. Bu-fei Cheng as Research Fellow in Urology, effective as of October 1, 1954;

Dr. Ernesto D'Agostino as Fellow in Anesthesia for one year, beginning July 1;

Dr. Sigismond Deutscher as Graduate Student Assistant on the Children's Medical Service, for a period of six months, beginning November 9, 1954;

Dr. Donald Dodds as Graduate Student Assistant on the Children's Medical Service, for a period of three months, beginning December 1, 1954;

Dr. Mercedes L. Enriques-Yap as Graduate Student Assistant on the Children's Medical Service, for a period of two weeks, beginning November 15, 1954;

Dr. Claude Faribault as Clinical Fellow in Radiology for one year, beginning January 1;

Dr. Jacques Houli as Clinical Fellow in Medicine, for a period of three months, beginning November 15, 1954;

Dr. Maurice McGregor as Clinical and Research Fellow in Medicine, assigned to Cardiology, effective October 20, 1954;

Dr. Richard G. O'Brien as Clinical Fellow in Radiology, beginning July 1;

Dr. Snorri Snorrason as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1, 1954;

Dr. Brian D. Stringer as Graduate Student Assistant in Surgery for one year, beginning November 15, 1954.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor considerable unnecessary time and trouble when you fail to include it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Anesthesia for wounded men.
J. Kentucky M.A. 52:692-694, 716.

Gravenstein, J. S., Devloo, R. A., and Beecher, H. K.
Effect of antitussive agents on experimental and pathological cough in man.
J. Appl. Physiol. 7:119-139.

Greene, N. M., Bunker, J. P., Kerr, W. S., von Felsinger, J. M., Keller, J. W., and Beecher, H. K.
Hypotensive spinal anesthesia: Respiratory, metabolic, hepatic, renal and cerebral effects.
Ann. Surg. 140:641-651.

Lasagna, L.
Nalorphine (N-allylnormorphine): Practical and theoretical considerations.
A.M.A. Arch. Int. Med. 94:532-558.

Lasagna, L., and Beecher, H. K.
The analgesic effectiveness of codeine and meperidine (Demerol).
J. Pharmacol. & Exper. Therap. 112:306-311.

Lasagna, L., and Beecher, H. K.
The analgesic effectiveness of nalorphine and nalorphine-morphine combinations in man.
J. Pharmacol. & Exper. Therap. 112:356-363.

Endocrinology

Goetz, F. C., Beigelman, P. M., and Thorn, G. W.
A method of insulin bio-assay and its application to human plasma fractions.
Proc. Soc. Exper. Biol. & Med. 86:484-486.

General Medicine

Graham, J. R.
Rectal use of ergotamine tartrate and caffeine alkaloid for the relief of migraine.
New England J. Med. 250: 936-938.

General Surgery

Allen, A. W.
Carcinoma of the stomach.
Geriatrics 9:493-496.

Allen, A. W., Donaldson, G., Sniffen, R. C., and Goodale, F., Jr.
Primary malignant lymphoma of the gastrointestinal tract.
Ann. Surg. 140:428-438.

Waddell, W. R., Geyer, R. P., Grillo, H. C., and Stare, F. J.
The treatment of malnutrition with particular reference to the surgical patient.
Am. J. Surg. 88:698-702.

Warren, R., Linton, R. R., and Scannell, J. G.
Arterial embolism: Recent progress.
Ann. Surg. 140:311-317.

Welch, C. E.
Medical progress: Abdominal surgery.
New England J. Med. 250:56-70.

Welch, C. E.
Le traitement chirurgical des pancreatites.
Maroc Medical 348:33-54.

Welch, C. E., and Rodkey, G. V.
A method of management of the duodenal stump after gastrectomy.
Surg., Gynec. & Obst. 98:376-379.

Welch, C. E., and Whittemore, W. S.
Carcinoma of the rectum in a centenarian.
New England J. Med. 250:1041-1042.

Gynecology and Obstetrics

Graham, J. B., Graham, R. M., and Liu, W.
Prognosis in cancer of the uterine cervix based on the vaginal smear before treatment: SR—The sensitization response.
Surg., Gynec. & Obst. 99:555-562.

Laboratory Science

Frenkel, A.
Light induced phosphorylation by cell-free preparations of photosynthetic bacteria.
J. Am. Chem. Soc. 76:5568-5569.

Gardner, L. I., Berman, H., and Deane, H. W.
Metabolic competition between desoxycorticosterone acetate and strophanthin-G in the rat.
Endocrinology 55:417-425.

Hager, L. P., Geller, D. M., and Lipmann, F.
Flavoprotein-catalyzed pyruvate oxidation in *Lactobacillus delbrueckii.*
Federation Proc. 13:734-738.

Hoch, F. L., and Lipmann, F.
The uncoupling of respiration and phosphorylation by thyroid hormones.
Proc. Nat. Acad. Sc. 40:909-921.

Lipmann, F.
Consideration of the role of coenzyme A in some phases of fat metabolism.
In Fat metabolism, V. A. Najjar, Editor, Baltimore, The Johns Hopkins Press, pp. 111-116.

Lipmann, F.
Development of the acetylation problem, a personal account. (This paper is based on Dr. Lipmann's Nobel Prize address delivered in Stockholm, Sweden, December 11, 1953, when the award in medicine and physiology was made.)
Science 120:855-865.

Neurology, Neurosurgery, and Psychiatry

Blom, G. E., and Nicholls, G.
Emotional factors in children with rheumatoid arthritis.
Am. J. Orthopsychiat. 24:588-601.

Zuidema, G. D., and Cohen, S. J.
Pseudotumor cerebri.
J. Neurosurg. 11:433-441.

Ophthalmology

Hirsch, O.
Operative treatment of pituitary tumors by the transsphenoidal septal method.
Medicus 8:147-157.

Hirsch, O., and Hamlin, H.
Fats of visual fields and optic discs in pituitary tumors.
Am. J. Ophth. 37:880-885.

Physical Medicine

Geiss, G. W., Myers, C., and Bevill, H.
Adapted two harness table loom.
Am. J. Occup. Therapy 8:202-203,219-220.

Miscellaneous

Clay, C. L.
Pastor & chaplain: An administrator's view.
South. Hosp. 22:22,24.

The *Journal of the Association of Medical Illustrators,* Number 6, 1954, contains articles of interest for doctors as well as illustrators. It may be read in the Treadwell Library or purchased by writing to Miss Kathleen Mackay, Business Manager, Woodruff Memorial Building, Emory University, Georgia.

The 1954 A. M. I. *Directory,* which includes biographical sketches of members of the Association, may be purchased from the editor, Mrs. Muriel McLatchie Miller, Medical Illustration Department, Massachusetts General Hospital, Boston.

ENDOCRINE RESEARCH

Endocrine research in the Vincent Memorial Laboratory had its inception in 1948 when, at the suggestion of Dr. Nathan B. Talbot, a project to develop a bioassay for the pituitary luteinizing hormone (LH) was undertaken by the writer in the newly-opened laboratory. Existing knowledge did not permit the chemical separation of follicle-stimulating hormone (FSH) and LH prior to bioassay. However, it appeared that biological fractionation of the two hormones in body fluids might be achieved by taking advantage of the high degree of specificity of their actions in the male test animal, as demonstrated by Greep.

With the aid of generous support from the Commonwealth Fund of New York to the Children's Medical Service, the goal of a bioassay for LH was steadily pursued. It was found that LH could be detected and roughly quantitated in suitably prepared extracts of human urine by the production of graded responses in the ventral prostatic weight of hypophysectomized immature male rats. Clinical application of the method followed. It was shown that the urine of prepuberal children of both sexes is devoid of the hormone; that in adult life LH is present in higher concentration in the urine of females than in that of males; and that in menopausal females and castrated males the titer of the hormone is increased 10- to 20-fold.

As the potentialities of this new tool for gynecological research became apparent, the project was expanded under the auspices of the Department of Gynecology. With the assistance of a generous grant from the Willcox Fund to Dr. Francis M. Ingersoll, serial studies were undertaken to ascertain the pattern of LH excretion throughout the menstrual cycle of normal adult women. It was found that a sudden increase in the rate of excretion of LH occurs in mid-cycle, immediately prior to ovulation. In women with menstrual disturbances associated with a failure of ovulation, the rate of excretion of LH is constant — no increases in rate occurring at mid-cycle or at any other time. These observations make it possible to distinguish those patients in whom nonoccurrence of ovulation is ascribable to failure of the ovary to respond to normal rhythmical LH stimulation (such as the Stein-Leventhal syndrome) from those in whom it is due to inadequate secretion of LH by the pituitary. These studies are currently being extended to women with menstrual and reproductive disorders of other types.

Methodological studies designed to increase the sensitivity of the LH assay are being conducted along with the clinical studies. The usefulness of measurement of P_{32} uptake by the prostate as an index of LH effect has been explored in collaboration with Dr. Melvin L. Taymor. The total P_{32} uptake appears to be a somewhat more sensitive indicator of LH activity than is prostatic weight, particularly at lower dosage levels. Fractionation of the prostatic tissue disclosed little or no change in the specific activity of the acid-soluble and phospholipid fractions, but a pronounced increase in the specific activity of the pentose nucleic acid and desoxyribose nucleic acid fractions.

Physiological studies directed toward elucidating the mechanisms underlying pituitary LH release are also in progress. That the ovarian steroids may be influential in this regard is suggested by the observation that the administration of a suitable dose of estrogen to normal women during the follicular phase of the menstrual cycle results in a sudden increase in the rate of LH excretion, a delay in the occurrence of ovulation, and a prolongation of the cycle. In patients with pituitary insufficiency, anovulatory sterility, and psychogenic amenorrhea, on the other hand, the administration of estrogen exerts no discernible effect upon the rate of LH excretion. These observations suggest that assays of urinary LH after estrogen administration may become a tool of considerable usefulness for ascertaining whether insufficiency with respect to LH excretion is due to failure of the pituitary to elaborate the hormone or to release preformed LH into the circulation.

The possibility that a neural factor also plays a role in bringing about the release of LH from the pituitary is being investigated in collaboration with Drs. Robert S. Schwab, Mary A. B. Brazier, and Mary Louise Scholl of the Department of Neurology. A description of the temporal relations between changes in the electroencephalogram and alterations in the rate of LH excretion and in other endocrine indices throughout the menstrual cycle of normal adult women is being obtained. Since there is abundant clinical evidence to support the concept that a rhythmic central nervous system discharge effects the release of LH in the human being, it will be of interest to ascertain whether the mid-cycle peak of LH excretion is preceded by significant changes in the character of the electroencephalogram.

Finally, the LH bioassay procedure is being used to guide the fractionation of human blood plasma in a collaborative project with the Protein Foundation and the Department of Biophysical Chemistry of the Harvard Medical School. It is believed that by means of techniques similar to those employed for the isolation of such human blood products as albumin, antihemophilic globulin, and gamma globulin, the gonadotropic hormones can be extracted from the blood. Their chemical and physiological properties can then be studied and their therapeutic usefulness evaluated.

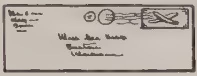
In all of these undertakings the investigators have enjoyed the support and encouragement of Dr. Joe V. Meigs, the Chief of the Gynecologic Service. It is hoped that, by the use of the new endocrine tools being developed in the Vincent Memorial Laboratory, knowledge of human reproductive physiology and of diseases of the reproductive system may be extended.

Janet W. McArthur, M.D.,
Assistant Physician

VOLUNTEER GROUPS

Distaff Club

Mrs. Soma Weiss, Community Relations Consultant for the Hospital, was guest speaker at the November meeting of the Distaff Club. Mrs. Weiss conducted an excellent discussion of the Massachusetts General Hospital, from both the economic and sociological viewpoint, and of our duties as doctors' wives in the Hospital and in the community.



New addresses:—

Dr. Richard Chute (*E.S.* 1929), 78 Upland Rd., Brookline 46, Mass.
Capt. Jean P. Gauthier-Lafaye, MC (fel. *An.* 1953), SP. 58.418, French Zone, Germany
Dr. H. Louis George, Jr. (*C.M.* 1929), 205 Trust Bldg., Watertown, N. Y.
Lt. Donald J. Glotzer, MC, USNR (*S.* 1953), Depot Infirmary, US Marine Recruit Depot, Parris Island, S. C.
Dr. Alexander C. Ritchie (a.r.p. *Path.* 1954), St. Mary's Hospital, 3830 Lacombe Ave., Montreal 26, Canada
Dr. Thornton Stearns (*E.S.* 1913 & *Or.* 1914), 736 Haxtun Ave., Orange, N. J.
Dr. Herman J. Sternstein (assoc. s. *Otolar.*), 54 Winter St., Norwood, Mass.
Dr. Joseph B. Tanner (sr. r.s. *Or.* 1954), 300 Homer Ave., Palo Alto, Calif.
Lt. Yang Wang, MC, USAF (*M.* 1953), 1605 USAF Hospital, MATS, APO 406, c/o Postmaster, New York, N. Y.

We were very glad to receive this fine letter from Dr. Sedgwick Mead (*E.M.* 1940 and *Path.* 1941), written from his new address—California Rehabilitation Center, 2600 Alameda Street, Vallejo, California:

> This is the first communication I have sent to The News since nearly seven years ago, at which time I left the MGH family and went to St. Louis. This will bring you up to date.
>
> In June of 1954, I resigned as Associate Professor and Director of the Division of Physical Medicine at Washington University in St. Louis and accepted the position of Medical Director here at the California Rehabilitation Center. This is a nationally and internationally known rehabilitation center, formerly called the Kabat-Kaiser Institute. Another center, under the direction of Dr. O. Leonard Huddleston, is located at Santa Monica, California. Both centers are loosely affiliated with the Kaiser Foundation Hospitals and Kaiser Health Plan. However, most of our patients come from sources outside the Kaiser chain.
>
> At Vallejo we occupy one end of a one-level, pavilion-type hospital, the other end of which forms one of the Kaiser Foundation Hospitals. There are 205 beds, all told, with 75 reserved for rehabilitation. A flexible arrangement exists, however, whereby the acute hospital needs can be expanded to some extent into the rehabilitation side and vice versa. We have an interesting and challenging arrangement in our rehabilitation ward. The patient begins with full nursing care and is graduated as soon as possible into one of the self-care wards, where he no longer receives nursing service and at most may hire an attendant to help with such minor difficulties as getting into or out of bed. The cost to the patient drops proportionately, so there is a strong motivation to move from nursing service to self care. Each time one of our patients graduates from the nursing ward to one of the self-care wards he receives a little diploma which bears a seal. Some of the patients live in inexpensive houses on what is called "The Terrace"—a series of utility flats maintained by the organization for the benefit of patients and their families.

Dr. Walter Bauer, Chief of Medical Services, and members of the Medical House Staff

The largest single group of patients on rehabilitation at the present time consists of poliomyelitis patients. We also have patients with multiple sclerosis, paraplegia, and assorted types of disability involving the nervous or musculoskeletal systems. Our centers have attracted attention internationally because of the development here of the facilitation techniques of neuromuscular re-education. These techniques employ the direct and intimate training of the patient, by the physical therapist, with manual resistive techniques and with special attention to patterns or neuromuscular engrams. These methods are under close study at the present time.

Before my family joined me in our new home at 1530 Arlington Boulevard, El Cerrito, California, we all got together on the East Coast and renewed friendships in and round New England. On August 25 we sailed for Genoa on board the *Vulcania* of the Italian Line. We had perfect weather and wonderful service and Italian cuisine. There were stopovers at Lisbon, Gibraltar, and Barcelona. We went by train from Genoa to Rome for the Third International Poliomyelitis Conference, which was held from September 6 to 11. I participated in several demonstrations of rehabilitation techniques and gave one paper in Italian on practical rehabilitation. These contributions were well received. We also visited the Pope's summer palace at Castel Gandolfo, where a special audience was held for members of the Congress. To my regret, I missed some of our Boston friends because of the diffuse nature of the Congress and the fact that it was spread out through many hotels. I did not get a chance to see Dr. Whittenberger or Dr. Enders, but had a chat with Dr. Chester Keefer.

We then flew by K.L.M. to Frankfort, where we had breakfast on a misty morning, and then to Schiphol—the airport at Amsterdam. If the Italian Line is our favorite steamship line, K.L.M. is certainly tops in our estimation as an airline! They couldn't do too much for us. We then took a bus to the small North Sea resort of Scheveningen, a few kilometers from The Hague. The family got in a good deal of sightseeing in both Rome and The Hague, while I had to stick more closely to business. We were on even terms in Holland, since I could speak the native language no better than they! The reason for going to Scheveningen was the Sixth International Meeting of an organization known as the International Society for Welfare of Cripples. I was an official delegate of the National Society for Crippled Children and Adults, and gave a short paper on paraplegia.

The family managed to get to the museum in Amsterdam where all those wonderful Van Gogh and Rembrandt paintings are, and together we went to Rotterdam one day and saw the pattern of reconstruction in the square mile of the city which was bombed out with mechanical precision by the Germans in 1944. The new buildings are perfectly magnificent. Efficient city planning has been utilized by the methodical Dutch. The low prices, the high quality of goods, the sincerity and the unfailing courtesy of the Dutch people make Holland among the most attractive countries we have ever visited. With many regrets we boarded a K.L.M. Constellation at midnight on Thursday, September 16, and Saturday morning at 7 A.M. we were in San Francisco. We did not deserve to have such perfect weather all the way. Not even one bump on the airplanes.

I have nearly a dozen rolls of stereocolor film which I trust will turn out well when developed and ready for showing. Now we are settling down again to hard work and to school, after a pretty disorganized but happy summer.

Anyone from Harvard or the M.G.H. who comes this way should call on us at our El Cerrito address, which is right next door to the University in Berkeley, and, above all, visit our center in Vallejo, which is about 34 miles from San Francisco, at the north end of the Bay. My telephone in Vallejo is 3-4551.

Best wishes to all our friends at M.G.H., and particularly in the Sixth General Hospital Association.

This letter has come from Dr. Fa-Chi Dunn (a.r.p. *D.* 1954), written from 478 A 36th Street, Oakland, California:

I have changed my address three times since we came to California last June. Consequently, we haven't heard from The News since we came out here, and both Chun-Ming and I miss the paper very much.

Although we came here in June, I didn't start to work until the middle of September. I waited three months to get my medical license. I am now working as staff dermatologist at the Kaiser Foundation Hospital in Oakland.

Chun-Ming is not working at the present time. Our 14-months-old boy keeps her "on call" 24 hours a day.

Dr. Carroll C. Miller (*W.S.* 1938) writes from his new address—304 Humphrey Street, Swampscott, Massachusetts:

In May of last year I moved my home and office to the above address and am practising General and Thoracic Surgery in the Lynn area. This is "home town" for me and it is pleasant to get back among many old friends and professional acquaintances. It is also a delightful place to live in and we are enjoying it.

Lt. George D. Zuidema, MC, USAF (*S.* 1954) has sent us this note:

Thanks so much for sending me the recent copy of The News. I will give you my new address now, to bring your files up to date. I am at the Wright Air Development Center, Box 8696, Area B, Wright-Patterson Air Force Base, Ohio.

My date of commission was August 28, 1954, and my date of active duty was October 8. My first permanent duty station was here at Wright-Patterson AFB, Ohio, where I am assigned to the Aeromedical Laboratory, Biophysics Division, where our research interests center on cardio-vascular physiology.

THE NEWS

No. 142 Boston, Mass. February 1955

SOCIAL SERVICE DEPARTMENT

In October of 1905 a somewhat disturbing event occurred in the Out-Patient Department of the Massachusetts General Hospital. A courageous physician, Dr. Richard C. Cabot, dared to say that something was lacking in our care of patients and that his remedy for filling this gap was to bring into the Hospital a strange, lay person—a social worker. His first annual report of the Social Service Department, entitled "Social Service *permitted* at the Massachusetts General Hospital", vividly states his concept of the situation: "In the Out-Patient Department of the Massachusetts General Hospital (and I suppose in most other hospitals) there occurs many times each year a scene not unlike that described in *Alice in Wonderland:*

'Have some wine, said the Hatter.
I don't see any wine, said Alice.
There isn't any, said the Hatter.'

Without any sense of the humor and pathos of the situation, we say (in substance) to many patients, take a vacation or get a job. There is none in sight and no means of getting any. What do we do then? We pass cheerfully to the next patient."

Through friends, Dr. Cabot raised funds and employed a social worker to help him and other physicians make medical care more effective. Sir William Osler, one of the contributors, wrote to Dr. Cabot in 1909: "I have just spent fifteen minutes reading your third 'Annual report' and I must send a line of congratulation, not only to you but to all members of your staff. That is what I call real work—getting at the problem at the right handle. How splendid it would be if every out-patient department in the country could have attached to it a similar organization. Practical sympathy is what is needed, so I send you $25.00. I wish I could add two or three figures to that sum. . . ."

This Hospital, always willing to try anything—even social workers—which might mean improved patient care, offered heat, light, and a circumscribed space in the Out-Patient Department, set off by a white screen and limited to one window. It was not long before it spread beyond that window—indeed, throughout the Hospital—at the request of clinicians who wanted this service for their patients. News spread outside, and hospitals elsewhere started similar departments.

In 1919, after fourteen years of testing and demonstration, the Trustees voted "that the Social Service Department become an integral part of the Hospital", and they then assumed its financial support. Dr. Cabot's annual report that year was entitled "Formerly a Territory, now a State in the Hospital".

The Department was fortunate in having from 1907 to 1945 Miss Ida M. Cannon as its Chief—a leader of understanding, patience, sound judgment, and broad vision. To her more than to anyone else this social movement is indebted for its growth and development. Countless workers, students, volunteers, doctors, and visitors have been influenced by her and the service here at the Massachusetts General Hospital. Many have become leaders in this country and abroad in medical social programs.

Dr. Martha Eliot, Chief of the Children's Bureau, an apprentice social worker here in 1914, recently wrote in a foreword to a Children's Bureau publication, *Medical social service for children:* "I had seen at first hand what the vision of that great pioneer, Dr. Richard Cabot, had meant in terms of the social component in medical care to patients in the hospital. The impact of my contacts with Ida Cannon and her staff carried over into the years of my medical training, hospital and teaching experience, and community activities. It is easy to see why, when I came to Washington in 1935 to administer the Maternal and Child Health and Crippled Children's Services, I knew it would not be possible to develop these programs effectively without consideration of the social aspects of medical care. For this reason I asked Edith Baker (a former member of the M.G.H. Social Service Department) to join the Children's Bureau staff."

What are some of the services requested and given to patients? Perhaps a typical illustration or so may best tell the story:

> Doctor A: "Good morning, Miss B. I have just seen in the clinic a 35-year-old woman. Came from Damascus, the land of milk and honey. Thought there'd be more milk and honey here. Not so! Not only that, but she has a husband and two children who are a great worry, and she has a pain in her stomach. There you are! Come in and meet her."

Time does not permit elaboration of how, through interviews and visits, the worker grew to know the patient, her husband, and the children; how she assisted the family to make use of community resources available to supplement the family income while the handicapped husband was being retrained for work he could do within his physical limitations; how she helped the family arrange for treatment in Child Psychiatry for the young son who, caught in the tensions and unhappiness of the family situation, was showing severe behavior problems. Through this helpful, friendly relationship with the doctor and social worker the patient learned that some of her reality needs could be alleviated, that some of her fears and disappointments could be understood and accepted, and that these problems all, somehow, bore relation to the pain in her stomach which was not cancer, as she feared.

Old age and chronic illness present social problems: An 80-year-old lady with severe heart failure was referred to us by the ward physician because she could no longer care for herself in her small apartment. The social worker talked with the patient and her Old Age Assistance Public Welfare visitor about plans for chronic care. One day an interested clergyman came, saying that the church wanted to continue to help financially as they had been doing. It developed that neither the Old Age Assistance visitor nor the clergyman was aware of the financial assistance being given by the other. When the social worker discussed this ethical question with the patient she said quickly, "Why, that's no problem. I get my authority from the Bible. It says don't let your right hand know what your left hand is doing." The patient, the doctor, the public welfare visitor, the clergyman, and the social worker arranged together a satisfactory joint plan for her care in a nursing home.

Let us look at the Department as it now is, forty-nine years after its inception and on the threshold of our Fiftieth Anniversary. Six hundred eighty-four patients were served in 1905, while approximately 9,000 were served in 1954. There is now a staff of 49 workers—one for each year of existence. Social workers are now assigned to every service in the Hospital. We are particularly proud of the unit in Psychiatry—both adult and children's—where 8 workers are assigned to carry on services, teaching, and research.

Two rather distinctive services have been developed here at M.G.H. Since 1930, at the request of the doctors, a social worker has been assigned to full-time service for the private patients in Baker Memorial and Phillips House. The problems there are no different. Illness and handicap bring disruption of personal and family life, irrespective of social and financial status. Assistance in care of children, plans for chronic or convalescent care, and help with other personal and family social problems are asked of the social worker. Many staff physicians use the service for their private office patients.

Three years ago, in the interests of better care to patients and their families in the traffic center of the Hospital—the Emergency Ward—the Administration asked for a full-time social worker there. At her desk, just inside the entrance to the Emergency Ward, she is available to help patients and families face the anxieties and the readjustments which have to be met quickly and many times dramatically when sudden accident, illness, or even death occur.

The training of from 10 to 14 social service students from 4 schools of social work goes on yearly. There is teaching of the social aspects of illness to those in allied professions—such as medical students, nurses, dietitians, and others. There are research activities. Several workers have participated in clinical research projects. In the study of children with arthritis and in Dr. Graham's study of optimal treatment of patients with cancer of the cervix, social workers are at present contributing to the social understanding and treatment.

In 1905, when Dr. Cabot brought social workers into the Hospital, the ideas of illness and patient care were narrower than they are today. Disease was conceived largely as organic pathology which could be identified through physical examination and tests. Hospital Social Service was one of the earliest manifestations of the swing toward a broader approach.

The concept of disease has grown to include physical, emotional, and *social* aspects, all of which must be understood and dealt with if medical diagnosis and treatment are to be effective. Thus, many specialists within and outside of medicine are required. Teamwork is becoming the method in the hospital of today.

Social work has grown. It has developed to a professional level in its knowledge of human behavior and its skills in helping people with social difficulties. In the medical team all members are concerned with the social aspects, but it is the social worker whose service is directed toward the interrelationships of the psycho-social and medical factors.

The Fiftieth Anniversary celebration which is to take place this year is being planned by a committee appointed by the Trustees. Dr. J. Howard Means is Chairman. The other committee members are: Miss Harriett M. Bartlett, former staff worker and educational director here, now Associate Professor at Simmons College School of Social Work; Miss Josephine C. Barbour, Chief of Social Service; Mrs. Robert Homans, member of the Board of Trustees of the Hospital; Dr. John P. Monks, Assistant Physician; Dr. Edward L. Young, member of the Board of Consultation and Chairman of the Social Service Advisory Committee; Dr. Oliver Cope, Visiting Surgeon; Dr. Dean A. Clark, General Director of the Hospital; and Mr. David C. Crockett, Associate Director for Resources and Development of the Hospital. The dates for the celebration are October 20, 21, and 22. There will be a reunion of alumnae, a day of preplanned workshops, a panel luncheon discussion with outstanding speakers, and a banquet and a final summing up in a paper to be presented which will be chiefly concerned with future developments and activities in the Department.

At this Fiftieth Anniversary we shall hope to evaluate the development of the past years, but, more importantly, to look forward to the growth which may take place in the half-century which lies ahead. A program committee, under Miss Harriett Bartlett, has tentatively formulated these questions which we may be considering with our medical colleagues at the Anniversary and in the years ahead:

1) What is good comprehensive care of the patient and what are the *essential social* components in such care?

2) How can the professions integrate their services to patients, to families, and to the community?

3) What is the essential contribution of the social worker as a member of the clinical team?

Thus, have the past fifty years seen the growth of a new professional service in medical care. It was fortunate in its leader and in the place where it was nurtured. Always friendly, though at times skeptical, the Administration, the Social Service Advisory Committee, and the Medical Staff have offered fertile soil, a warm climate, and helpful support.

Josephine C. Barbour,
Chief of Social Service

THE STANLEY COBB FUND
AT THE HARVARD MEDICAL SCHOOL

A wide circle of MGH graduates, colleagues, and friends will be interested to hear, I think, that a fund has been set up aiming at the endowment of a Professorship of Psychiatry in honor of Stanley Cobb. While the fund is accumulating, the income may be used for urgent needs of the Department of Psychiatry, or added to the fund's capital. It seems right that this fund should be started soon after Dr. Cobb has become *"emeritus"* and yet is still at the height of his activity. The affection and respect of his friends and associates, young and old, may find expression in this undertaking.

The members of the Fund Committee are: Charles P. Curtis, Ralph Lowell, Dr. Harry C. Solomon, Dr. LeMoyne White, Dr. Henry S. Forbes, chairman, Hildegarde B. Forbes, secretary.

We hope that several advantages will result from the Professorship: better coordination between the teaching of psychiatry and other courses of instruction at the Harvard Medical School; greater opportunity for research; a closer tying together of work at children's centers, and mental and general hospitals, with work at the School; and finally a wider application of the knowledge gained to help solve problems of mental and social health.

The fund is off to a good start, but has a long way to go. Dr. George P. Berry, Dean of the Faculty of Medicine at the Harvard Medical School, has been a warm supporter from the beginning. Dr. Alan Gregg is most enthusiastic, and has allowed us to publish a letter from him in our descriptive leaflet. This may be obtained from the School or from committee members.

H. S. F.

[Henry S. Forbes, M.

Additions to the fund, by gift or bequest, may be made out and sent to the Treasurer of Harvard University, 140 Federal Street, Boston, Massachusetts.

Dr. Dean A. Clark, our General Director, has added his endorsement of the Cobb Professorship in these words:

On behalf of the Massachusetts General Hospital, I wish to say how pleased we are that this fund is being raised in honor of our much-admired former Chief of Psychiatry Service, Dr. Stanley Cobb. I am confident that many of you who read this will be eager to contribute to the fund.

* * *

Brief bits:—

On November 17, Dr. Edward B. Benedict attended the meeting of the American College of Surgeons in Atlantic City, where he took part in the postgraduate course on Surgery of the Lower Esophagus, Stomach, and Duodenum. He also presented a paper on "The value and limitations of Endoscopy in the differentiation of benign and malignant ulcer".

On December 15, Dr. Stanley Cobb delivered the Fifth Annual Lecture by the Leopold Stieglitz Visiting Professor, presented by New York University College of Medicine at the Bellevue Medical Center. His subject was "Multiple etiology in Psychiatry and Medicine".

Dr. Sheridan S. Evans (*E.S.* 1945) announces the removal of his office to 619 South Broadway, McAllen, Texas.

Dr. James M. Faulkner (*E.M.* 1925), Dean of Boston University School of Medicine, has been appointed Medical Director of Massachusetts Institute of Technology.

Dr. Reed Harwood delivered a lecture on "Diabetic acidosis" at the Postgraduate Course on Diabetes and Basic Metabolism Problems, given by the American Diabetes Association, at Lankenau Hospital in Philadelphia.

Dr. Bernard M. Jacobson spoke to the Lowell Medical Club on December 9, on "Why the patient bleeds and what to do about it".

Dr. Earl M. Wedrow announces the opening of his office for the practice of Psychiatry, at 205 Beacon Street, Boston, Massachusetts.

* * *

Mr. George E. Hamilton, custodian of the doctors' parking lot, tells us that Dr. Marian W. Ropes won his 1954 award for careful parking.

[Due to the illness of the editor, we are obliged to omit the staff publications column this month. This issue contains only such material as the editor had already prepared for publication, plus (fortunately) a large amount of overset which had been held over from the January number. The omitted titles will appear next month.]

MASSACHUSETTS EYE & EAR INFIRMARY

A meeting of the Eastern Section of the American Trilogical Society was held at the Hotel Warwick, Philadelphia, on January 7. Members of the Infirmary staff who attended included Dr. LeRoy A. Schall, Dr. Moses H. Lurie, Dr. Daniel Miller, and Dr. John R. Richardson. Dr. Robert Gohd, Research Virologist at the Infirmary, presented a paper, by invitation, on "The common cold".

The Council Meeting of the Trilogical Society was held on January 8 at the Waldorf-Astoria in New York City, and was attended by Dr. Schall.

Dr. Giulio Pestalozza, associate of Professor L. Pietrantoni of the University of Milan, Italy, spent a week recently in the Department of Otolaryngology. On January 5, Dr. Pestalozza presented to the staff Dr. Pietrantoni's film on pharyngolaryngectomy combined with block dissection.

Dr. Louis E. Griffey began his residency in Otolaryngology on November 1, and is at present in the Mosher Laboratory.

Dr. Baruch Sachs, son of Dr. Benjamin Sachs, Consulting Surgeon on the Infirmary staff, began his residency in Ophthalmology on January 1.

Members of the Infirmary staff were the guest lecturers at the Private Duty Nurses Section of the meeting of the Massachusetts State Nurses Association, held on February 3.

At the morning session, the speakers were Dr. George F. Reed—"Laryngectomy: Cancer of the larynx"; Mrs. Mary Gontarski, R.N.—"Postoperative care of laryngectomy patients"; Mrs. Mary Doehler—"Instruction in osophageal voice"; and Dr. Robert R. Trotter—"Glaucoma".

In the afternoon, Dr. Charles L. Schepens spoke on "Recent progress in retinal surgery"; Mrs. Katherine Pendergast, R.N., on "Nursing care of patients with detached retina"; and Mrs. Patricia Huddleston on "The value of Occupational Therapy in the care of retina patients".

The Board of Trustees, at their meetings on December 17 and 31, voted:

To accept the resignation of Julie S. Crocker, Assistant Resident in Anesthesia, effective December 31, 1954;
To accept with regret the resignation of Dr. David S. Kahn, Assistant Pathologist, effective December 31, 1954.

To promote:

Dr. Sylvester B. Kelley to the position of Visiting Urologist.

To appoint:

Dr. Herbert S. Cline as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. Walter C. Cotter as Second Assistant Resident in Neurosurgery, beginning January 1;
Mr. Joseph W. Degen as Assistant Director, beginning December 16, 1954;
Dr. Michael J. Franzblau as Assistant Resident in Dermatology for one year, beginning July 1;
Dr. Wallace F. Haley, Jr. as Assistant in Psychiatry, beginning January 1;
Dr. Joshua J. Hurwitz as Assistant in Urology;
Dr. Edward Karamanoukian as Assistant Resident in Dermatology, for six months, beginning January 1;
Dr. Albert L. Rosenthal as Assistant Resident in Dermatology for one year, beginning July 1;
Dr. Harold A. Rudy as Assistant in Urology;
Dr. Paul M. G. St. Aubin as Assistant Radiologist, beginning January 1.

At their meetings on December 15, 22, 29, and January 5, the General Executive Committee voted:

To extend the appointment of Dr. Salomon Hakim as Research Fellow in Neuropathology, for six months, beginning January 1.

To promote:

Dr. Alfred J. Luessenhop to the position of First Assistant Resident in Neurosurgery, for a period of six months, beginning January 1;
Dr. Fleming McConnell to the position of First Assistant Resident in Radiology for one year, beginning January 1;
Dr. Bernard B. Stone to the position of Resident in Neurosurgery, for six months, beginning January 1;
Dr. Frederick S. Tomchik to the position of Resident in Radiology for one year, beginning January 1;
Dr. Setrag A. Zacarian to the position of Resident in Dermatology, for the period January 1 through June 30.

To reappoint:

Dr. Winnifred P. Chase as Clinical Assistant in Medicine for one year, beginning January 1;
Dr. William B. Clapp as Clinical Assistant in Medicine for one year, beginning January 1;
Dr. James A. Flagg as Assistant Resident in Anesthesia for one year, beginning January 1;
Dr. John W. Irwin as Clinical and Research Fellow in Medicine, assigned to Allergy, for one year, beginning January 1;
Dr. Irving H. Itkin as Clinical Assistant in Medicine for one year, beginning January 1;
Dr. John W. Keller as Clinical Assistant in Medicine for one year, retroactive to July 1, 1954;
Dr. Louis Kunian as Clinical Assistant in Medicine for one year, beginning January 1;
Dr. Winifred Liu as Research Fellow in Surgery, assigned to Gynecology, for one year, beginning January 1;
Dr. Marc P. Moldawer as Clinical and Research Fellow in Medicine for one year, beginning January 1;
Dr. William E. Reynolds as Clinical and Research Fellow in Medicine for one year, beginning January 1;
Dr. Raymond J. Savignac as Clinical Assistant in Medicine for one year, beginning January 1;
Morris Soodak, Ph.D. as Assistant Biochemist for one year, beginning January 1;
Dr. Giles D. Toll as Third Assistant Resident in Surgery, beginning January 1;
Dr. Thorkild Waino-Andersen as Clinical Fellow in Anesthesia, retroactive to May 18, 1954;
Dr. Gordon DuF. Winchell as Clinical Assistant in Medicine for one year, beginning January 1.

To appoint:

Dr. Thomas C. Hall as Clinical Assistant in Medicine for one year, beginning January 1;
Dr. Stephen M. Krane as Clinical and Research Fellow in Medicine, beginning January 1;
Dr. Jacques H. Lebrun as Clinical and Research Fellow in Surgery, beginning January 1;
Dr. Robert P. Smith as Clinical and Research Fellow in Medicine, beginning January 1;
Dr. Uthai Sri-Aroon as Graduate Student Assistant in Orthopedics, for the period November 15, 1954 through February 14, 1955;
Dr. Christopher H. Wood as Clinical Fellow in Medicine for one year, effective as of December 1, 1954.

The General Executive Committee also voted:

That Dr. John B. Graham's request for an appropriation of $250 from the End-Result and Follow-up Study Fund for the work of Dr. Winifred Liu in following up post-menopausal bleeding cases treated with a D & C be approved;
That in addition to Dr. Guillermo C. Sanchez's title of Research Fellow in Anesthesia, he be granted the title of Clinical Assistant in Medicine, with the privilege of assisting Dr. Daniel S. Ellis in the Baker Memorial and Phillips House;
That Dr. Chiu-chen Wang's title be changed from that of Clinical Fellow to that of Research Fellow in Radiology, through March 31.

IMPRESSIONS ON INDIA

Having spent the better part of the last ten years in the States, it took time and effort to adjust myself to the new perspectives, scales, and relations in India. Leaving there after a six-months' stay, I carried the over-all impression that wholesome influences were at work, that the country was in good hands, that vital problems were being faced head on, and that the achievements to date had exceeded one's highest expectations. India today is sounder, healthier, more prosperous and vigorous than the India I knew ten years ago.

In 1947, after nearly two centuries of British rule, independence came to India. The country was partitioned on a purely religious basis and the new State of Pakistan, whose people are like Indians in every respect except in the matter of religion, was launched. The government of India passed into the hands of people poorly equipped to run a nation. Administrators with training and experience were few. They found their hands full of a multitude of manifold problems and challenges inevitably brought on by the termination of the protracted British rule. And, as if these were not enough, new disasters struck immediately—the most serious ones being massive dislocation of population and fierce religious riots.

Many of the 30 million Hindus in the newly created Muslim State of Pakistan (total population 100 millions) wanted to move over the border into India. Many of the Muslims in India (total population 370 millions, Muslims 30 millions) felt the same way about joining Pakistan.

As a result, there began the "greatest interchange of population in history". In the middle of a hot, blazing summer, more than 12 million people set out, mostly on foot, often traveling through deserts, to seek their new homeland. The government was caught with a problem of enormous magnitude. In a matter of weeks, the population of Calcutta and Delhi increased 3-fold or more. People were without homes. They slept on streets and in gutters. Food was meager and they foraged in garbage. Epidemics threatened. Rehabilitation of refugees became the primary concern of the young, inexperienced government—not yet sure of its moorings. Already up to its neck, it had more troubles ahead. A new series of disasters rocked the nation. Fierce religious riots broke out in various parts of India. Massacre on a mass scale took place and the number of the killed ran into several hundred thousands. The entire country was engulfed in gloom. The pervading feeling all over India was one of insecurity, frustration, and defeat. Gandhi, trying to inspire a new hope into the nation, was murdered by a fanatic. Large parts of Eastern India were ravaged by floods; Central and Western India suffered droughts. For three years in succession, crops failed. Food supply became critical. The Nehru Cabinet worked tirelessly, without a moment's breathing space, against seemingly insurmountable odds, and the country and the government survived. Against this background, India's accomplishments in the seven formative years since independence have been nothing short of miraculous. With similar and worse odds, Pakistan's spirit and enterprise have already won the world's respect.

What is the record of India's accomplishments in the past seven years since independence? A stable, constitutional government in action during this period is, in itself, no mean achievement. A constitution incorporating the best democratic principles of the western countries was written and put into operation. A free, democratic general election with wide franchise was held, probably for the first time in an Asiatic country.

A comprehensive Five-Year Plan—aimed at all-round improvement, with emphasis on agricultural and industrial progress—was introduced in 1951. Many experts characterized it as a dreamy plan at the time. With two years still to go, the results have been beyond expectations, and many of the targets set for 1956 have been achieved two years ahead of time.

About 75 percent of India's 370,000,000 persons living in about 47,350 agricultural communities derive their livelihood from agriculture. Agriculture produces roughly half the national income. As a result of the Plan, agricultural production has risen one-fourth in the last three years. The government has been prompt in introducing land reforms. Absentee landlordism has largely been done away with. Industrial production has gone up more than one-third under the impact of this measure. In the first three years, the national income of India has increased by 14 percent. The immediate program includes about 140 large irrigation and 100 power projects.

But aside from the financial and economic progress resulting from it, the Plan has a deeper significance. In India, where disruptive forces are many, it exerts a unifying influence on the country. Enthusiasm for self-improvement is very much in evidence all over India, and this fact constitutes the greatest success of the Plan.

The driving force behind all that India has gained so far and is likely to gain in the next few years is Nehru. More than 300 million Indians love him. Working tirelessly, traveling continually throughout the country, whizzing from one village to another through dust and heat, literally rubbing shoulders with his people, speaking a dozen or more times a day—Nehru, almost singlehandedly, has rallied 370,000,000 people into a nation under its own flag for the first time in several centuries. This task of enormous magnitude can be appreciated only when one thinks of the marked differences in the looks, languages, dresses, foods, customs, and religions in various parts of India. Nehru's greatest mission lies in the uniting of the country. India without Nehru is unthinkable. Realizing the unhealthiness of this situation, he recently proposed to step down, at least temporarily, from the prime minister's office. Entire India was in an uproar. The matter was dropped.

Nehru is a volcano of energy, in constant eruption. His day begins at 6:15 and ends at 1:00 the next morning. In between, he is constantly on the go, attending to his numerous duties as Prime Minister, Foreign Minister, Defense Minister, Chairman of the Planning Commission and of the National Development Council, and, until recently, the President of India's most powerful political party —the Congress Party.

Nehru is a much misunderstood man in America. He has been accused of being soft on the communists. His neutrality has been viewed with suspicion—often called "phony" and given names like "anti-western neutrality" and "nehrutrality". However, many American politicians of weight and influence have visited him in the past few years and have come back with the conviction that there is nothing "phony" about this man. Nehru dislikes communism. He has modeled India along strictly democratic lines. He has ruthlessly dealt with communists at home and, under his leadership, the communist party in India has remained a nonentity. Recently, on his return from Red China, he characterized Indian communists as "anti-India, anti-people, anti-progress, dazzled by Russia and China, but ignorant of India". He added, "They are without moorings in the land of their birth. They are pledged to a policy of creating mental and physical conflicts. They indulge in a cult of disruption." He further went on to say, "When I visited China, I refused to be swept off my feet. Our achievements are as great and our methods are much better." He was referring to democratic methods which are having their first large-scale trial in an Asiatic country, and Nehru has had the sole responsibility for their amazing success so far. He is no dreamer. He is well aware of the international character of the world communist movement and is skeptical of the Red Chinese pledge of non-interference in the affairs of other Asiatic countries. He realizes that communism is an ever-present threat to India, that a fight against communism is a fight against poverty. He continues to work hard to raise the living standards of his people. He believes that Indians must rely on their own resources, capabilities, and productive capacities to pull themselves up from economic servitude. On the other hand, he knows that India needs capital and know-how in order to expedite progress, and he has repeatedly expressed his deepest gratitude to America for all the U. S. funds and skill flowing out to India to dam great rivers and dig new mines.

Short of a war, Nehru will not join camps. He sees no useful purpose being served by doing so. Nehru's neutrality does not consist of watching events from the side lines. On every major international issue, he has taken a definite stand and active steps to reach what he thinks to be the right solution. He honestly believes that he can best serve the cause of peace by acting as a mediator between the two camps.

The problem of raising the deplorably low standard of living is so paramount that progress in other fields has been understandably slow or held up. Although top leadership is devoted to the program of furthering education, particularly at the primary and secondary levels, the gains have been minimal and the picture remains a gloomy one. The over-all illiteracy rate in India is 85 percent. Free and compulsory education through the age of fourteen is the government's goal, which is not likely to be attained in the near future. Other needs are so great that school budgets are still woefully small. The scale of pay for teachers is so low that primary and secondary schools do not attract adequately trained instructors. Physical equipments are generally poor. Children of school age in the rural areas stay out of school because they are needed at home to help run the family and the farm.

Overriding as they are, economic problems are not the only ones that bedevil the educational system. With emphasis shifting from English to the local languages in secondary and high schools, the language situation has become very complex. Some dozen languages are being used in various parts of the country as the medium of instruction. In large cosmopolitan cities like Calcutta, Bombay, Delhi, or Madras, it is not unusual to have schools in the same city using different languages — one for Bengalee-speaking, another for Marathi-speaking, and a third for Gujarati-speaking children.

The recent establishment of "basic

schools" represents a radical departure from the usual classroom type of teaching in the primary and the secondary schools. The aim is a lofty one, for under the new program children will "learn through activity", with a strong emphasis on trades and crafts. The curriculum calls for "instruction in agriculture, mechanics, handicrafts, and domestic skills". Again, shortage of trained teachers and inadequate facilities have stood in the way. Instead of learning the skills included in the program, the students spend their time sweeping floors and ploughing fields. When they graduate from high school, they are pathetically ignorant of such basic subjects as literature and mathematics and, for lack of equipment, they have acquired none of the skills mentioned in the curriculum. Deterioration in the quality of teaching in the post-independence period is quite striking and is a matter of great concern to the educationists. Commenting on basic schools, one embittered educationist remarked, "Let us not improve education out of existence."

While quality has gone down, numbers have gone up and now, each year, about three times as many students graduate from high schools as they did ten years ago. The vast majority of these want to go to college and, in order to accommodate them, many liberal arts colleges have mushroomed into existence. Poorly staffed, lacking in talents and facilities, these colleges turn out huge numbers of graduates each year. There is no more pathetic a creature than a liberal arts graduate in India. He considers it below his stature to take any manual job, to work in villages, or in the fields. He lacks the initiative to enter business. His entire horizon is limited to one aspiration: landing a well-paid government job. During the British rule, when the number of such graduates used to be small, he had a fighting chance of getting one. Today his chances are less than one in fifteen and, failing to get a government job, he withdraws to a life of bitterness, frustration, and defeat. The increasing surplus of liberal arts graduates has led to increasing unemployment among them, and radical changes in university education are urgently needed to check this unhealthy trend.

Judged by American standards, technological institutions in India can be called such by courtesy only. By any standards, they are ill-equipped, in both talents and materials, to impart any decent technological training.

The medical educational system in India retains its English pattern. The resemblance, however, is in superficial details only. In fact, the Indian medical schools are poor imitations of those of the British. During my few months in India, I was associated with the Patna Medical College and the attached Patna General Hospital. This gave me an excellent opportunity to see things from the inside. The school, with its attached hospital, easily ranks among the top six medical institutions in the country and is fairly representative of the best that India has to offer in teaching, research, and medical practice. In it, I saw an inspiring and, at the same time, a most dismaying challenge.

The school is a part of the Patna University, which is autonomous and supposedly free from governmental interference. However, the university depends entirely upon State governmental grants for its upkeep, and a constant source of irritation is the petty politicians' frequent meddling with the affairs of the school. The attached hospital is controlled and run by the State government, and very often the school and the hospital pull in opposite directions. In staff appointments, the important thing is often not merit but how much political influence one can summon. Promotions are by seniority only, and one has to be very careful not to offend the politicians. In a moment of despair, the current vice-chancellor of the Patna University, sighed, "Seniority, senility, and servility are what count here."

In the clinical departments, the top men are usually members of the Royal College of Physicians or Surgeons, having passed the membership examination from either London or Edinburgh. The number of good doctors being limited, such men have their own large private practices in addition to their hospital duties. In fact, private practice claims so much of their time that they have little left in which to do any reading in their fields and they cease to grow quite early in their careers. Their interest in teaching flags. They have no time to think of research, so research does not exist. There was not a project going on in any of the clinical departments during the months I was there.

Teaching is didactic—almost entirely by lectures. Superb teaching material on the wards is left untapped and students derive no benefit from it. They are given no encouragement to participate in ward activities. The atmosphere is one of learning-by-rote, which is not stimulating. It is pathetic to see eager students memorizing the characteristics of mitral stenosis murmur without having listened to one. Without having taken care of a single patient and with no real feeling for medicine, they graduate from medical school and, without any further clinical training, the vast majority of them enter into private practice. For no fault of their own, they are doomed to mediocrity for the rest of their lives.

On the general wards, patients receive very inadequate care. The ward physician, almost surely a busy private practitioner, may not get around to seeing even the seriously sick patients for days or even weeks, so they just lie there without any medical attention and with little nursing care. Not infrequently, death may precede the physician. The house staff—they have nothing in common with MGH interns and residents—lack the training, knowledge, experience, and judgment to give effective medical care.

Diagnostic facilities are meager. A patient who has routine blood, urine, and stool studies done is supposed to have been intensively studied from the laboratory point of view. There is no chemical laboratory worth anything. A chloride determination is a major procedure. Other electrolytes are just not done. A visocardiette exists, but half the time it is out of order and it is seldom if ever used on the wards. A radiology service exists, but it is too busy taking care of paying ward patients to take care of general ward patients. Lack of facilities is not due to lack of money, for grants to medical institutions are generous. It is lack of organization and interest that is responsible for this sad state of affairs, and the chief of service must take the blame for it.

If such is the state of affairs in what is regarded as one of the best hospitals in the country, what happens in the lesser hospitals is best left to the imagination. The feeling among the public is that one goes to hospitals only to die. Such a feeling is well justified. Only the very-well-to-do can afford good private doctors and good medical care. Indian doctors do not enjoy the affection or respect of the public. They are regarded as a mercenary lot and, I think, rightly so. The majority have little feeling or sympathy for the patients whom they treat. They often make the saving of a man's life seem like an insult.

This is a gloomy picture of education and medicine in India. There is confusion of ideas and deterioration in standards. On the other hand, perhaps this picture is colored by my own high—and unrealistic—expectations in these fields. In a country where the paramount problem is physical survival and the raising of terribly low living standards of 80 per-cent of its 370,000,000 inhabitants, it is perhaps futile to think — so soon after 1947 — in terms of research, academic medicine, modern diagnostic aids, and first-class medical care. I did meet some fine, scholarly, zealous men in both the ministries of health and education, who are imbued with a keen appreciation of the great magnitude and complexity of the educational and medical problems facing them. There is certainly no tendency on their part to ignore the situation or let it go by default. And with Nehru in the vanguard and a unified population behind him, the educationists and the medical men must inevitably quicken their pace in the march toward India's bright future.

Madan M. Singh, M.D. (*M.* 1952),
Clinical and Research Fellow in Medicine

For a detailed survey of the culture and religion of India, we refer you to the excellent article by Dr. Singh which appeared in our January 1953 issue.—*Editor.*

VOLUNTEER GROUPS

MGH STAFF WIVES HOSPITAL COMMITTEE

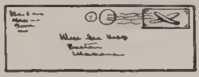
We were very sorry to hear of the death on January 8 of Mrs. Abraham L. Finesinger, who was one of our Staff Wives. Mrs. Finesinger had been of great help to us in many ways, particularly in arranging the music programs for the Staff Wives Music Committee.

MEMBERS OF THE MEDICAL AND CHILDREN'S MEDICAL HOUSE STAFF

DISTAFF CLUB

On December 9, the Distaff Club held its annual cake sale in the Brick Corridor. It was a great success. Mrs. Farahe Maloof was the chairman.

Our Christmas Party was held in the Penthouse on December 16, with Mrs. Thomas C. Peebles as the chairman. This was a festive occasion, with new and old members present to celebrate the Christmas season.



New addresses:—

Dr. Arlie V. Bock (*W.M.* 1917), 13 Holyoke St., Cambridge, Mass.

Dr. Wilma J. Canada (a.r.p. *Path.* 1951 & r.p. *R.* 1954), St. Luke's Hospital, New Bedford, Mass.

Dr. Lincoln D. Clark (*M.* 1948), 33 Canterbury St., Andover, Mass.—after April 1.

Dr. Ira A. Ferguson, Jr. (*S.* 1953), 353 Argonne Drive, N.W., Atlanta, Ga.

Dr. Joseph A. Freidberg (*Or.* 1926), 2939 Vernon Place, Cincinnati 19, Ohio

Mr. Francis W. Hatch, *Trustee,* 462 Boylston St., Boston 16, Mass.

Dr. Robert W. Hopkins (*S.* 1948), Pennsylvania Hospital, Philadelphia, Pa.

Dr. David S. Kahn (r.p. *Path.* 1950), St. Mary's Hospital, Montreal, Canada

Dr. Arthur S. Keats (a.r.p. *An.* 1951), Department of Anesthesiology, Jefferson Davis Hospital, Houston, Tex.

Dr. Walter S. McClellan (*W.M.* 1925), 406 Whitehead Circle, Chapel Hill, N. C.

Dr. Jost J. Michelsen (a.r.s. *N.S.* 1938), Box 328, Back Bay Post Office Annex, Boston, Mass.

Dr. George F. Odland (*M.* 1947), 1523 Medical Dental Bldg., Seattle, Wash.

Lt. John C. Rowe, MC, USAR (*M.* 1952), United States Army Hospital, 8162nd Army Unit, APO 45, San Francisco, Calif.

Dr. Stanley Sober (a.r.s. *Or.* 1953), 707 Waterloo St., London, Ontario, Canada

Dr. Alexander L. Zaoussis (a.r.s. *Or.* 1954), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. Clark received this letter from Dr. Anne P. Forbes (a.p.):

Here is a brief outline of our activities this year in France.

We began with a month of sheer vacation at Annecy, near the Swiss border—not only to enjoy the loveliness of that beautiful medieval town and its surrounding mountains and to get good sunburns and bicycling muscles, but also to acquire as much familiarity as possible with French prices, customs, expressions, traditions, etc. before setting up shop seriously in Paris.

From there I made a few trips to Geneva to listen to rounds and conferences in Dr. René Mach's department. I was much impressed by the work there. They have a supply of the new adrenal steroid aldosterone for clinical trial, and have found out some interesting things about it. They are doing good steroid assays by several methods on blood and urine. I met many of the younger people in Dr. Mach's department who have spent some time at the M.G.H.—Alex Müller, Jacques Chatillon, Pierre Ducommun, for example. Bernard Jacot has moved from Geneva to Lausanne. These boys are unanimous in their enthusiasm for the M.G.H. and even sometimes homesick for it. I have had the same reaction in Paris from some of the doctors who have studied at the General.

My first job here is to be visiting physician in charge of two female wards on the medical service of the Laennec Hospital. This I have only just begun and so far, of course, I am more of a burden to the staff than anything else, but it is going to be very instructive and lots of fun. The assignment was arranged for me by Dr. Albeaux Fernet, the chief of the service, whose main interest is endocrinology. In addition, I spend one day a week seeing endocrine cases in Dr. Camus's clinic at the Cochin, and I am going to try to spend some time in Dr. Jayle's laboratory. This laboratory is thought to be the most advanced and reliable for steroid assays of all sorts.

Happily, I am not going to be obliged to work full time. This would be a mistake in a sojourn of only one year. There is an infinite amount to do, see, and learn in this extraordinary city—which it would be a crime to ignore—and we all intend to profit by it. A year is a very short time to spend abroad. This has been the reaction of many of the people who came to work with us at the Massachusetts General. They found themselves just getting under way when it was time to go. Short-time visitors need a lot of help and showing about if they are to begin to profit in the time allowed.

THE NEWS

No. 143 Boston, Mass. March 1955

ORTHOPEDIC SERVICE

About three years ago there were well-founded fears that the patient census on the Orthopedic Service, both House and OPD, was in an alarming decline. The situation remained rather critical through much of 1953, with the ward census at times down to nearly 50% of capacity.

To remedy this serious situation a variety of steps were taken. Physicians who referred their paying patients to our staff were informed that we would also welcome their patients who could not pay for the costs of care. The Admitting Office liberalized its policy and made every effort to admit all worthy applicants. Vigorous steps were taken to improve the quality and efficiency of service in the OPD (now called the Clinics of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary). An appointment system was installed, the physical setup was remodeled, and the Orthopedic Clinic was shifted to afternoon hours so that the entire House Staff and the assigned Visiting Staff could complete the operating schedule and other duties which so often caused their absence from morning clinic hours.

We believe that these measures helped to reverse the declining census. In any case, the picture in 1954 was much improved. Total Orthopedic Clinic visits increased 22% over 1952. The wards on White 5 were filled to capacity much of the time. This was due to an increase in both fracture and orthopedic patients. The work load of our House Staff is now extremely heavy. Is the load so heavy that it is endangering the quality of patient care and the quality of training afforded our House Staff? They must have time to think and read as well as to act. The Hospital Administration's efforts to keep our beds filled and to utilize our magnificent plant at maximum efficiency deserves the full cooperation of the professional staff.

One of the most difficult tasks of the Services is to meet the fluctuating requirements of patient load without over- or understaffing with Interns and Residents. The patient load for which our House Staff was responsible this past year is indicated in this table:

1954 Orthopedic Service patient load

Admissions (Wards, P.H., B.M.)	2,097
Operations (Wards, P.H., B.M.)	1,639
Ambulatory visits (Clinics)	10,028

Our House Staff consists of one Senior Resident, five Orthopedic Assistant Residents (4th year level), one Surgical Resident (3rd year level), and one Surgical Intern (1st year level).

Certain types of disability require specialized, intensive, and prolonged care. Paraplegics, amputees, severe poliomyelitics, arthritics with multiple joint involvement, etc. are examples of these problems. They should not be cared for on an acute surgical ward. Certain other surgical patients—viz. burns, postoperative cardiacs, etc.—might also fall into this group. A unit has been opened on White 8 to offer better care to these patients. In place of the conventional larger wards, the space assigned has been subdivided into four-bed rooms. This permits grouping of patients by age, sex, and disability, for maximum efficiency in nursing care and for improvement in patient morale.

A number of patients with paraplegia have been brought together on this ward. Although the Orthopedic House Staff is responsible for their care, an interservice team supervises their efforts. Weekly rounds are held, in which members of the Urology, Neurosurgery, Physical Medicine, General Surgery (Plastic), and Orthopedic Services participate (Drs. Leadbetter, J. C. White, Watkins, Cannon, and Barr).

In similar fashion the amputee rehabilitation program is supervised by Drs. Record, Burbank, and Watkins.

The concept of an interservice unit, devoting itself to the more difficult rehabilitation problems related to surgery, holds promise of improved patient care, improved teaching, and improved research opportunities. It should help to promote interdepartmental cooperation and restrain "empire building".

The teaching load of the Service remains heavy. Harvard Medical School third year students, under Dr. Thornton Brown's expert eye, learn to strap an ankle, apply a cast, reduce a Colles' fracture, and, most important of all, they learn the art of adequate history taking and the technique of examination of the locomotor system. A few Harvard Medical fourth year students come back for an elective month on our wards.

Our most avid students are the Residents. During the past year Dr. DeLorme arranged for a distinguished list of guest speakers to participate in an extremely interesting series of Residents' Seminars.

A restricted number of foreign graduate students enrolled through Harvard Medical School for study in our department. Among them were Dr. U Ba Pu, from Burma, Dr. Meeran Rowther, from Pakistan, Dr. Luis Irigoyen, from Venezuela, and Dr. Uthai Sri-Aroon, from Thailand.

The annual one-week intensive postgrauate course "Treatment of fractures and other traumatic conditions" was given in November to an enthusiastic group of forty-eight surgeons from all parts of the United States.

Ever since publication of the "MGH fracture book" in 1938[1], it has been obvious that sooner or later we would have to face the task of revising it or of making a new effort. Under the leadership of Dr. Cave, the task has been undertaken and, if the timetable can be adhered to, the manuscript and illustrations will be ready to forward to the publishers within the next few months. It is a formidable undertaking, but the division of labor is such that no one has an impossible task. We trust that the new "Fracture book" will add luster to the Massachusetts General Hospital and be of real value to those who are responsible for the management of patients suffering from acute trauma.

The sudden death of Dr. Armin Klein on April 3, 1954 came as a shock to all of us. A loyal and tireless member of our group since 1922, he had just reached the age at which he could lay down the responsibilities of membership on our Active Staff. We cannot properly list or evaluate his many contributions to the M.G.H., to medicine, and to orthopedics. He was faithful, industrious, wise, and kindly. Scores of orthopedic surgeons (the writer included) are proud to say he was our teacher. The annual dinners which he gave for the Resident Staff were always memorable occasions. His contributions to the advancement of orthopedics were many, but the outstanding one concerns the entity of slipped capital femoral epiphysis. For many years he studied this difficult problem and was the recognized leader in the development of modern effective treatment of this potentially crippling affection of the adolescent hip.

Research

Almost every member of the staff is busily and happily (we trust) engaged in one or more clinical or laboratory studies. Dr. Brown's laboratory work on the dynamics of the lumbar spine is beginning to produce valuable new information with definite clinical implications.

Drs. Norton and Brown have completed an investigation of the immobilizing effect of various braces, corsets, and casts on the lumbo-sacral spine. None of the standard supports tested effectively restricted motion of the lower lumbar spine on the sacrum. They have designed and built a new type of brace which, on preliminary clinical tests, is performing well.

The detection and evaluation of psychologic factors in somatic disease is still very much of an art. A recently completed cooperative study[2] made on patients with low-back pain by a team from the Psychiatry and Orthopedic Departments sheds some new light on this important and difficult problem.

Dr. Elliott B. Sweet, on completion of his assistant residency, accepted a fellowship established by Arthur Godfrey to study arthroplasty of the hip and to evaluate the end-results of various techniques as used to alleviate the common hip disabilities. This critical and statistical study of the MGH end-results complements the pioneering work of Dr. M. N. Smith-Petersen and of his associates in the field of hip arthroplasty.

It may come as something of a shock to the reader that surgical materials designed to be left permanently within the human body are not routinely tested for their biological properties and physical fitness of design. In fact, there are essentially no recognized standards to help the surgeon in deciding on a proper choice of implant materials. This should be a matter of great concern to surgeons, manufacturers of surgical implants, hospital purchasing agents, liability insurance companies, and, in fact, to everyone who has been or may be a surgical patient. A Joint Committee for the Study of Surgical Materials, with representatives of the American Medical Association, the American College of Surgeons, and the American Academy of Orthopedic Surgeons, has studied this problem and has published a report in which it is recommended that "a new organization be set up for the purposes of research, development of standards, testing, evaluation of products, and provision of an information service—all in the field of surgical materials". The Committee recommendations have met with great approval except for the A.M.A., whose counsel has raised various legal questions which must be resolved by the Federal Trade Commission and the Department of Justice. We trust that patience, fortitude, and hard work will bring success to this important undertaking.

I cannot close without mentioning by name our two Senior Residents—Dr. Joe Tanner and Dr. Tom DeLorme, and our always faithful Mrs. Fritz of the Social Service Department, whose skill and devotion to duty have contributed so much to the smooth functioning of our Service during 1954.

This report has omitted much that would be of interest. We realize that there is always room for improvement, but we are proud of our past achievements and face the future with confidence.

Joseph S. Barr, M.D.,
Chief of Orthopedic Surgery

✣ ✣ ✣

The first "Videclinic"—a special closed-circuit television program to bring the advances in medicine to physicians quickly — was presented coast to coast on Wednesday evening, February 9, by the American Medical Association, in cooperation with the Smith, Kline and French Laboratories of Philadelphia. The televised scientific conference on "The management of coronary artery disease" was viewed by 18,000 physicians in 31 cities from coast to coast. The Massachusetts Medical Society cooperated in the Boston arrangements for a capacity audience of doctors in the Ballroom of the Hotel Statler.

Outstanding heart specialists from various parts of the country appeared on the program to give live and filmed clinical reports of their work in coronary disease. Dr. Paul D. White, our Consultant in Cardiology, participated in the program and presented eight patients in our Ether Dome. Others from Boston who took part in the scientific discussions were Dr. Howard B. Sprague, Physician on our staff and Clinical Associate in Medicine at Harvard University, and Dr. Frederick J. Stare, Chairman of the Department of Nutrition at the Harvard School of Public Health.

Dr. James M. Shannon (*S.* 1948), Salem Hospital, Salem, Mass.

OFFICIAL NOTICE

PHARMACY

It has been the practice in this Hospital for many years to use tetanus toxoid, alum-precipitated, for immunization against tetanus. This was predicated on the concept that three doses of fluid toxoid were necessary to provide the same protection as two doses of alum-precipitated toxoid. This concept was based on comparative antitoxin titer response in animals, using fluid toxoid and alum-precipitated toxoid. Animal experiments, using mice, indicated that about thirty times more fluid toxoid than alum toxoid was required to induce 50% immunity to challenge with toxin. Antitoxin production in guinea pigs indicated about a hundred-fold difference in potency.

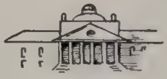
Because the State Biological Laboratory has distributed only fluid tetanus toxoid, it has been necessary to purchase the alum-precipitated toxoid from pharmaceutical houses. It is interesting to note that during 1953 and 1954 it was necessary to charge patients receiving this toxoid approximately $5,000.

Recently, however, Ipsen[1] demonstrated with human subjects that there is no significant difference between response to alum-precipitated toxoid and to fluid toxoid, and that two injections of fluid tetanus toxoid will confer ample basic immunity.

Accordingly, the Pharmacy will dispense, without charge to patients, fluid tetanus toxoid obtained from the Division of Biologic Laboratories, Commonwealth of Massachusetts, unless a physician insists upon the alum-precipitated toxoid. Also, the Pharmacy will provide, primarily for adult use, fluid tetanus and diphtheria toxoids, combined. This should be the preparation of choice when adults are to be immunized against tetanus, because immunity against diphtheria will be maintained at the same time.

John T. Murphy,
Pharmacist-in-Chief

(1) Ipsen, J.: Immunization of adults against diphtheria and tetanus, New England J. Med. 251: 459-466, 1954.



The Board of Trustees, at their meetings on January 14 and 28, voted:

To accept with regret the resignation of Dr. Lucie Jessner as Psychiatrist, effective April 15;

To accept with regret the resignation of Dr. Joe V. Meigs as Chief of the Gynecology Service, effective June 30, and to appoint him Consulting Visiting Surgeon, effective July 1.

To appoint:

Dr. Robert D. Breer as Assistant Resident on the Children's Medical Service, beginning July 1;

Dr. John G. Freymann as Assistant in Medicine, effective as of November 1, 1954;

Dr. Theodore J. Haywood as Assistant Resident (exchange resident) on the Children's Medical Service, for the months of January and February;

Dr. Justin R. Hüppe as Resident in Radiology, beginning April 1;

Dr. John W. Keller as Assistant in Medicine, effective as of January 1;

Dr. Susanne J. Lamdin as Assistant Resident in Anesthesia, beginning September 1;

Dr. Thomas C. Leinbach as Assistant Resident in Orthopedic Surgery for one year, beginning July 1;

Dr. Robert S. Richards as Second Assistant Resident in Radiology, beginning July 1.

The Trustees also voted:

To increase the quota of Interns on the Medical Service by four for 1955, making a total of 16 Interns;

To increase the quota of Assistant Residents on the Surgical Service by one for 1955, making a total of 24.

At their meetings on December 15 and during January, the General Executive Committee voted:

To reappoint:

Dr. Robert S. Adams as Clinical Fellow in Psychiatry, for six months, beginning January 1;

Dr. N. Joel Ehrenkranz as Clinical and Research Fellow in Medicine for one year, beginning January 1;

Dr. Franz S. M. Herbst as Clinical and Research Fellow in Dermatology, beginning March 1;

Dr. Andrés Rosselli as Clinical and Research Fellow in Neurology for one year, beginning February 1;

Babette S. Whipple, Ph.D. as Research Fellow in Psychology, for the period January 2 through May 15.

To appoint:

Dr. Albert I. C. DeFriez as Clinical Assistant in Medicine, with the privilege of assisting Dr. Charles L. Short in the Baker Memorial and Phillips House;

Dr. Jean P. Fabre as Clinical Fellow in Medicine, for the period February 1 through June 30;

Dr. Sung J. Liao as Clinical Fellow in Physical Medicine, beginning March 1;

Dr. Olle G. A. Lundskog as Senior Fellow in Anesthesia, for a period of six months, beginning approximately February 1;

Dr. Carl V. Reichman as Graduate Student Assistant in Surgery, for a period of nine months, beginning January 3;

Dr. Arthur H. Shears as Clinical Fellow in Physical Medicine, beginning July 15;

Dr. Samuel J. Sunnenblick as Graduate Student Assistant in Surgery, for a period of nine months, beginning January 3;

Dr. Felix S. Vecchione as Clinical Fellow in Psychiatry, for a period of six months, beginning January 3.

* * *

THE RETINA FOUNDATION

It seems that in the last two decades, clinical centers have become increasingly propitious ground for the development of basic research. The fundamental reasons for this may be threefold. First, many of the diseases on which research is now focused cannot be investigated adequately in laboratories deprived of close hospital connections. Secondly, both the basic research workers and the research-minded clinicians derive immense stimulation from cooperative work. Thirdly, a very alert and productive research staff is indispensable to a forward-looking teaching hospital. It is its best advertising agency, it offers a more stimulating atmosphere to residents and students, and it attracts problem patients to the hospital. The last factor becomes increasingly important to help balance the teaching hospital's budget.

The following paragraphs describe another case of successful symbiosis between basic and clinical research connected with a hospital.

Origin and development

In 1948, the Massachusetts Eye and Ear Infirmary established a special clinic called the Retina Service. All cases suspected of retinal detachment were sent to this clinic for examination and advice as to treatment. The number of patients referred increased rapidly, and improvements in the diagnosis and treatment of retinal detachment resulted in an increase in the percentage of reattachments of the retina from about 45 to over 70 percent.

It soon became apparent that, despite the number of successful operations, the lack of data about the formation, structure, and metabolism of the vitreous body was retarding further progress in the treatment of retinal detachment and of other conditions. For instance, shrinkage of the vitreous body was recognized as an important cause of breaks in the continuity of the retina and, subsequently, of retinal detachment; but there were no clues as to the possible causes of the retraction of the vitreous gel *in vivo*. In order to find the answer to this and other related problems, it was decided that a program of basic research should be instituted. The Retina Foundation was created in April 1950, by Dr. Schepens, to carry out the program; this was made possible through the assistance of a few good friends, such as Mr. Ralph Lowell and Dr. Trygve Gundersen.

The Foundation purchased a tenement house at 30 Chambers Street, and proceeded to raise the funds necessary for the equipment of laboratories. Through the good offices of the Foundation's president, Dr. Paul Boeder, we received an electron microscope, light microscopes, and other equipment on loan from the American Optical Company. The late Mr. C. J. Maney, a former retina patient and a prominent Boston contractor, donated the remodeling of the Foundation building into laboratories.

The creation of the Retina Foundation actually resulted from the renewed interest of the clinicians at the Retina Service in problems connected with the retina and the vitreous body. The success of the project was entirely dependent upon the solution of an arduous problem: to gather a team of basic research workers who would fit into this program.

In December 1950, Dr. Endre A. Balazs came over from Sweden, where he had been working at the Karolinska Institute for the previous four years. His first duties were to help plan and supervise the remodeling of the Foundation's tenement house into laboratories, and to organize the first basic research unit of the Foundation—the Biochemistry Laboratory. Dr. Balazs also actively participated in the formulation of plans for future research activities.

In 1951, thanks to Dr. Dunphy's interest in our young organization, it became affiliated with the Massachusetts Eye and Ear Infirmary and the Department of Ophthalmology at the Harvard Medical School. The remodeled Retina Foundation building was dedicated on May 16, 1951, and on the same day, the Foundation learned that it had been awarded grants from the Kresge Foundation and the Hyams Trust, for a total of $62,700.

In July 1951, Dr. Marie A. Jakus left the Department of Biology of the Massachusetts Institute of Technology to join the Foundation's research staff and organize a laboratory for electron microscopy. At the same time, Dr. Fritz Wachendorf, a physicist interested in optics, arrived from Germany to head a three-year lens computing program at the Foundation. In September 1951, Dr. Laszlo Varga, who was Research Associate at the Department of Biology of the Massachusetts Institute of Technology, joined the Foundation's staff as a part-time investigator in the Biochemistry Laboratory; in collaboration with Dr. Balazs, he set up a program in physicochemical research. During the spring of 1952, Dr. Balazs organized laboratories for tissue culture and for radioactive isotope work. In the same year, two members of the Massachusetts General Hospital research staff became consultants to the Foundation: Dr. John Gergely and Dr. Gordon L. Brownell, in protein chemistry and nuclear physics, respectively. In July 1953, Dr. Arthur Howe, a biochemist from Yale University, and in January 1955, Dr. Natalie Mayer, a chemist from New York University, joined Dr. Balazs's team.

From the start, visitors from abroad have come to work with us for periods of time ranging from two months to two years. Among them are both basic scientists and clinicians who are interested in a fundamental approach to clinical problems: Dr. Antonio Grignolo, University of Parma (Italy); Med. Kands. Torvard Laurent and Ulla Helsing Laurent, and Miss Ann-Marie Allgoth, Karolinska Institute, Stockholm (Sweden); Dr. Carl Erik Zimen, Chalmers University of Technology, Göteborg (Sweden); Dr. Claes-Henrik Dohlman, University of Lund (Sweden); Dr. J. A. Szirmai and Dr. P. H. Mars, University of Leiden (Holland).

Parallel to this rapid expansion of our basic research, clinical research was developed, though on a more modest scale because it had to be tailored according to the space made available at the Massachusetts Eye and Ear Infirmary. Dr. Ichiro D. Okamura joined our clinical unit in November 1952, to perform research related to retinal detachment and to abnormalities of the vitreous; and in September 1954, Dr. Robert J. Brockhurst started a study of certain aspects of uveitis.

The Retina Foundation, not quite five

years old, has a staff of twenty-eight. The investigators are helped by the following ten research assistants: D. M. Bunney, B.S., M. C. Ciampa, M.S., A. E. Collins, B.S., E. A. Eckl, B.A., A. F. Feldman, H. T. McCarthy, B.S., R. E. McGovern, B.A., A. M. O'Rourke, A.B., M. T. Shannon, and M. G. Tobin, B.S. In addition, the investigators receive assistance from the Foundation's two instrument makers—Robert Thompson and Carl Nyholm.

As our organization is unendowed, we have to raise our yearly budget of $150,000 ourselves, through Federal agencies, private foundations, former patients, and friends.

Research activities

Unity in the activities of the Retina Foundation is fundamentally achieved by their orientation toward investigation of connective tissue. From a clinical standpoint, connective tissue in the eye plays a role of immense importance: it controls the transparency of the cornea and vitreous, and its disturbance is an important factor in the etiology of retinal detachment, uveitis, retrolental fibroplasia, and many degenerative conditions of the choroid and retina. Observation in the living eye of certain early alterations of connective tissue metabolism seems possible and deserves further study, as it may help elucidate problems of general importance in collagen diseases. The Foundation's present activities are carried out in four units: a laboratory for biochemistry, for fine structure, for tissue culture, and a clinical research unit.

The research training of Dr. Balazs and his team covers a wide field: biochemistry, physical chemistry, immunology, histochemistry, and experimental cytology. The cooperation and teamwork, on parallel projects, between investigators representing different scientific disciplines, form the basis of our *modus operandi.* The subjects for investigation are selected from four general fields of connective tissue research: the chemical composition of extracellular substance, the formation of mucopolysaccharides, the physicochemical properties of mucopolysaccharides, and the interaction between the ground substance and connective tissue cells.

An extensive study has been made by this group on the chemical structure and formation of the vitreous body, with emphasis on the hyaluronic acid, ascorbic acid, and protein content. The formation of the vitreous and the changes in its chemical composition were studied in cattle embryos and in calves (Balazs, T. Laurent, and U. Laurent). Electrophoretic and ultracentrifugal studies were made on the liquefied vitreous body (Varga and Balazs). Certain gel properties of the vitreous body are currently studied (Varga). Years ago, Drs. Balazs and Laurent observed that mucopolysaccharides are easily destroyed by ultraviolet light. Further investigation of the radiation effect on mucopolysaccharides has been initiated in Dr. Balazs's laboratory along two lines: (1) the effect of ultraviolet radiation on hexoses (T. Laurent); (2) the effect of ultraviolet light, x-rays, and cathode rays on the vitreous body—the simplest mucoid connective tissue—is now being studied by Dr. Howe. Investigations on the chemical composition of two other connective tissues—the corneal stroma and Descemet's membrane—were made in collaboration with Dr. Dohlman. Similar investigations are in progress on the mucoid tissue of the rooster comb. One of the most interesting components of the extracellular substance of the connective tissue is hyaluronic acid; the biosynthesis and physicochemical properties of this substance was investigated. An apparatus for radioactive carbon assay in gas phase was set up to facilitate the determination of C^{14} in small tissue samples or tissue components (Zimen, Brownell, Balazs). Incorporation studies of radioactive carbon-labeled glucuronic acid (a moiety of the hyaluronic acid molecule) in the developing vitreous and in the growing rooster comb are still in progress (Balazs, Szirmai, Mars). This group has an extensive interest in physicochemical studies of hyaluronic acid obtained from different connective tissues. The size and shape of this molecule were studied by means of a light-scattering method (Laurent, Gergely). The diffusion and sedimentation properties of hyaluronic acid are studied by Dr. Varga. Investigations are being carried out on the interactions between mucopolysaccharides and proteins or mucopolysaccharides and dye ions (metachromasia), by Drs. Balazs and Mayer. Quantitative tissue culture methods combined with cinephotomicrography are being used by Dr. Balazs to investigate the effect of mucopolysaccharides on the migration and mitosis of fibroblasts *in vitro.*

The laboratory for fine structure was established in order to investigate eye tissues. As Dr. Jakus had previously been interested in collagen, it was natural for her to start with a study of the cornea. After a suitable thin-sectioning technique had been worked out, the micromorphology of the different layers of the cornea was investigated, particular attention being paid to structural details not resolved by visible-light microscopes. Studies of the corneal epithelium, the stroma, the Descemet's membrane have already yielded fruitful results. Comparative studies of these structures in the adult are being carried out, as well as an investigation of their embryonic development. Parallel surveys of the sclera and of the lens have been begun and will be continued.

In the clinical research unit, there are three main areas of interest to Dr. Schepens and his team. The first is the improvement of methods for optical examination of the living eye. Instruments used for this purpose have not changed much for almost fifty years, probably because mathematical computation of new lens systems is a complicated and tedious process. High-speed computing machines have removed the tediousness by speeding up many phases of this computation. Dr. Wachendorf has been able to use the computing facilities of the Digital Computer Laboratory at the Massachusetts Institute of Technology, and of the Computing Unit of Dr. James Baker at the Harvard Observatory. Pilot models of new instruments are made at the workshop of the Retina Foundation under the guidance of our consultant in mechanical engineering, Mr. Charles V. Mahlmann.

The second area selected for clinical research is the improvement of surgical procedures for the treatment of retinal detachment. As this condition is caused by breaks in the retina, its cure depends entirely upon the surgeon's ability to detect and close the breaks. For the last twenty years, diathermy applications to the sclera overlying the retinal breaks have been used. In an effort to obtain better results, particularly in unfavorable cases, various methods for buckling the sclera and choroid, in the area of the retinal breaks, were developed by Drs. Schepens and Okamura, and proved successful. Experience gained with surgery of the sclera may open new possibilities, which are now being explored, for the surgical treatment of several other eye conditions.

The third area of activity in clinical research is a study of certain aspects of uveitis—one of the most frequent causes of blindness. During the last thirty years, investigation of infectious agents as possible etiological factors has been rather disappointing. Uveitis often resembles certain collagen diseases, and it seems probable that it may be caused by a complicated process in which the primary disturbance is localized in the perivascular connective tissue. The relationship between certain types of juvenile uveitis on the one hand and, on the other hand, rheumatic fever and rheumatoid arthritis in the young, are currently under investigation (Brockhurst).

Teaching is an important function of the Retina Foundation. In the laboratories for basic research, we have received a number of guests who came to familiarize themselves with special methods in biochemistry. Several members of our staff contribute to the teaching program of the Department of Ophthalmology at the Harvard Medical School. In the clinical field, young ophthalmologists have been trained and have later established retina clinics in their home cities, such as New York, Baltimore, San Francisco, Parma (Italy), Lyon (France), and Buenos Aires (Argentina). In April 1954, a fellowship was created by the Retina Foundation for the training of young ophthalmologists in certain aspects of clinical eye research, and in the diagnosis and treatment of retinal conditions. It was awarded to Dr. Silvio von Pirquet, from Austria, who joined our laboratories for one year.

At the joint meetings of the clinical and the research staffs extremely useful discussions are taking place; they have become a strong stimulus for original thinking amongst clinicians overburdened with urgent problems of patient care. In return, such contacts also remind basic research workers, in a vivid fashion, of the fundamental usefulness and importance of their work to patients.

During the second half of the 19th century, the investigation of the ophthalmoscope gave ophthalmology an era of enormous development, as it permitted the ophthalmologist not only to see blinding lesions, located behind the lens, but it also helped considerably in the diagnosis of systemic diseases—particularly vascular and intracranial conditions. Having marked time for nearly fifty years, is ophthalmology due for a comeback? New techniques have opened possibilities for research in areas where it is a distinct advantage to work with the eye. Probing by the Retina Foundation's staff into some of these areas has raised challenging problems, which cannot be adequately solved unless many other investigators become similarly interested. This would strengthen our effort and, we hope, help stimulate those research workers who explore the realms of connective tissue metabolism from other angles.

Charles L. Schepens, M.D.,
Director of the Retina Foundation

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

Mrs. Edwin M. Cole was pleased to note the number of our visitors from other countries who came to take tea with the Staff Wives on January 18. There were physicians and their wives from the Mediterranean countries, the Near East, the Far East, South America, South Africa, Central America, and at least one representative from each of the European countries.

We wish to inform our foreign friends that the English Speaking Union offers the facilities of its organization to temporary British visitors and their families. They have teas once a month on Sundays, at 44 Commonwealth Avenue, and they hope that all British visitors will come. Also, there is the International Student Center at 33 Garden Street, in Cambridge. The activities there are many and varied—from ski trips to the nearby mountains to teas and suppers and interesting programs at the Center. In addition, there are classes in English, and the Americans can learn foreign languages.

Mrs. Cole wishes to express publicly her deep appreciation to Mrs. Soma Weiss and the staff of M.G.H., without whose generous cooperation none of these teas could be held—and so successfully.

The next tea will be on Monday, March 7, between four-thirty and six o'clock, in the Medical Staff Room of the Bulfinch Building. We hope to see all our old friends there, and many new ones.

Mrs. Richard H. Sweet of 27 Chestnut Street, Brookline, would be most grateful to receive household furnishings of any description—beds, tables, lamps, "white elephants", bottles to convert to lamps, chairs, couches—anything, in any sort of condition, that will help make a "home" for our physicians who are visiting from abroad. We will take mattresses, too, for we do them over, so that they are clean and fresh for our friends. The condition of the furniture does not matter, as our visitors can restore them to a new—even but temporary—life.

If it is impossible for you to get any of these things to Mrs. Sweet's barn, arrangements can be made to pick them up.

We wish to emphasize especially that there is no charge for any of these household effects.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. Despite the fact that this request has been made in each issue of THE NEWS for over four years—ever since we started this column—some few authors still fail to include that information. Consequently, we have had to adopt the procedure of returning the report to the sender whenever the classification is not obvious.

Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

This is the last issue in which 1954 titles will appear.

The following new titles have been received:

Dentistry

Thoma, K. H.
Medical progress: Oral surgery.
New England J. Med. 250:603-607.

Thoma, K. H.
Treatment of condylar fractures.
J. Oral. Surg. 12:112-120.

Thoma, K. H.
Tumors of the condyle and temporomandibular joint.
Oral Surg., Oral Med., & Oral Path. 7:1091-1107.

Endoscopy

Benedict E. B.
Endoscopic aids in diagnosis.
J. Maine M. A. 45:285-289, 292.

Benedict, E. B.
Gastroscopy with biopsy: Differential diagnosis of carcinoma of the stomach.
Missouri Med. 52:23-25.

General Surgery

McDermott, W. V., Jr., Morgan, W. S., Hamlin, E., Jr., and Cope, O.
Cancer of the thyroid.
J. Clin. Endocrinol. & Metab. 14:1336-1354.

Riddell, A. G., Kopple, P. N., and McDermott, W. V., Jr.
The etiology of "meat intoxication" in the Eck fistula dog.
Surgery 36:675-684.

Sarnoff, S. J., and Cope, O.
The effect of atropine and scopolamine on the subsequent injection of epinephrine in thyrotoxic and euthyroid patients.
Anesthesiology 15:484-494.

Gynecology and Obstetrics

Green, T. H., and Meigs, J. V.
Pseudomenstruation from posthysterectomy vaginal vault endometriosis.
Obst. & Gynec. 4:622-634.

Ingersoll, F. M., and Meigs, J. V.
Lymph node dissection for carcinoma of the endometrium.
In Proceedings of the Second National Cancer Conference, 1952, New York, American Cancer Society, vol. 1, pp. 747-753, 1954.

Meigs, J. V.
Fibroma of the ovary with ascites and hydrothorax—Meigs' syndrome.
Am. J. Obst. & Gynec. 67:962-987.

Meigs, J. V.
Pelvic tumors other than fibromas of the ovary with ascites and hydrothorax.
Obst. & Gynec. 3:471-486.

Laboratory Science

Jeanloz, R. W.
Synthesis of 4-*O*-methyl-*beta*-D-galactopyranose and 2,4-di-*O*-methyl-*alpha*-D-galactopyranose.
J. Am. Chem. Soc. 76:5684-5686.

Jeanloz, R. W., and Gut, M.
Methyl 3-*O*-methyl-*alpha*-D-glucopyranoside and derivatives.
J. Am. Chem. Soc. 76:5793.

Jeanloz, R. W., and Stoffyn, P. J.
4-*O*-methyl-D-galactosamine hydrochloride (2-amino-2-deoxy-4-*O*-methyl-D-galactose hydrochloride).
J. Am. Chem. Soc. 76:5682-5684.

Stoffyn, P. J., and Jeanloz, R. W.
Identification of amino sugars by paper chromatography.
Arch. Biochem. & Biophys. 52:373-379.

Neurology, Neurosurgery, and Psychiatry

Farnsworth, D. L.
Mental health—Keystone to education.
J. School Health (Dec.) 1954.

Waksman, B. H., Porter, H., Lees, M. D., Adams, R. D., and Folch, J.
A study of the chemical nature of components of bovine white matter effective in producing allergic encephalomyelitis in the rabbit.
J. Exper. Med. 100:451-471.

Ophthalmology

Balazs, E. A.
Studies on the structure of the vitreous body: I. The absorption of ultraviolet light.
Am. J. Ophth. 38, pt. II:21-28.

Jakus, M. A.
Studies on the cornea: I. The fine structure of the rat cornea.
Am. J. Ophth. 38, pt. II:40-53.

Schepens, C. L.
Clinical aspects of pathologic changes in the vitreous body.
Am. J. Ophth. 38, pt. II:8-21.

Varga, L., and Balazs, E. A.
Studies on the structure of the vitreous body: II. Electrophoretic and sedimentation properties.
Am. J. Ophth. 38, pt. II:29-37.

No. 53 in a series of Staff photographs
Mr. Joseph W. Degen, Assistant Director

Otolaryngology

Kelemen, G.
The tonsils in advanced age.
Eye, Ear, Nose & Throat Monthly 33:723-726.

Pediatrics

O'Keefe, E. S.
Cortisone and desensitization in allergic conditions—Infantile eczema.
M. Times, New York 82:861-864.

O'Keefe, E. S.
Cortisone and desensitization in infantile eczema.
Irish J. M. Sc., Nov. 1954.

O'Keefe, E. S.
Diarrhea in infancy: The importance of a high calory diet in the treatment of diarrhea in infancy.
M. Times, New York 82:241-246.

* * *

It took a good deal of courage for us to ask Dr. Carl Binger if we might use another of his unpublished verses in The News. We happened to know of one of his poems that would be most timely for this season of the year, and we are very grateful to Dr. Binger for giving us his permission to publish it.

RESURRECTION

Through leafy mold these firstlings pierce with push of spring:
Skunk cabbage and fern.
Each living thing bespeaks its turn
In this harmonious procession.
All is amove in the earth.
While red-wings flash their signals in the air
And rabbits dart across the road,
Deep in his lair the whiskered woodchuck
Stretches out his cold and sleepy limbs
To scratch himself behind the ear
And catch the freshening of the year.

* * *

Brief bit:—

Dr. John W. Smillie (*E.S.* 1944), Assistant Professor of Ophthalmology at the Medical School, University of Michigan, writes us that he has been elected to Fellowship in the American Academy of Ophthalmology, elected to the Vestry of St. Andrew's Episcopal Church, and appointed to the faculty of Michigan's Horace H. Rackham School of Graduate Studies.

MASSACHUSETTS EYE & EAR INFIRMARY

The Annual Meeting of the New England Otolaryngological Society was held on February 9, in the Upper Amphitheatre of the Massachusetts General Hospital. Dr. LeRoy A. Schall presided over the morning Clinical Conference. Dr. Charles I. Johnson presided at the afternoon session, during which the guest speakers included Dr. Edley H. Jones of Vicksburg, Mississippi, who spoke on "An otolaryngologist does his own allergy"; Dr. J. Brown Farrior of Tampa, Florida, on "Provincial ear surgery"; and Charles R. Williams, Ph.D. of Boston, on "The legal and compensation aspects of industrial acoustic trauma".

On February 16, the meeting of the New England Ophthalmological Society was held at the Infirmary. The guest speaker at the afternoon session was Dr. C. B. Favour of Palo Alto, California, who spoke on "Bacteriological allergy of the eye". "An immunologist's approach to problems of ocular allergy" was the subject of Dr. Byron H. Waksman of the Massachusetts General Hospital — the evening guest lecturer.

During the week of February 21, Dr. Edwin B. Dunphy, Chief of Ophthalmology, was Visiting Professor in Ophthalmology at the University of Louisville School of Medicine, Louisville, Kentucky.

The Massachusetts Lions Eye Research Fund has awarded a fellowship of $4,000 to Dr. Rameshwar L. Pahwa for the further continuation of his studies of the retina and cornea. Dr. Pahwa has been working in the Howe Laboratory, and has recently entered the Retina Service.

Dr. Robert Gohd, Research Virologist at the Infirmary, took part in a symposium on February 11 and 12, at the National Health Institute in Bethesda, Maryland. This meeting was sponsored by the National Health Institute and the Common Cold Foundation.

Recent Staff changes:

Dr. Hugo D. Angelini, who completed his training at the Infirmary in 1951, has been appointed an Assistant in Otolaryngology.

Dr. Robert J. Herm, who has just completed his residency in Ophthalmology, will be working with Dr. David D. Donaldson in the Howe Laboratory for the next six months.

THE NEWS

No. 144 Boston, Mass. April 1955

VOLUNTEER DEPARTMENT

A woman of 45 strides purposefully through the doorways and corridors of the Massachusetts General Hospital and enters the office of the Volunteer Department. A student of 18, a man of 70, a woman who has a family, a member of a junior organization, a premedical student, secretaries, school teachers, and many others follow the same pattern. Age is irrelevant — it's spirit that counts.

What do all these people have in common? It is this: An interest in the welfare of this Hospital and its patients, and a desire to give a definite amount of their time in service for others. Above and beyond the hours they serve, they bring to the Hospital the warmth of community life, and to the patients and the Hospital personnel the feeling of family, friends, and home.

The foresight and pioneering direction of the Ladies' Visiting Committee, back in 1869, provided the impetus for this most important Department. Although not formally organized until 1941, it had its early beginnings in 1905 in the Out-Patient Department. The opportunities for volunteer service have vastly changed from the days when the primary idea was to bring care and comfort to the individual patient at the bedside. Today the manifold indirect services which are so necessary in maintaining ideal patient care are of inestimable value.

The purpose of the Volunteer Department is threefold:

1. To supplement the activities of the regular Hospital staff by releasing professional personnel from duties that do not require professional training, thus increasing effective and broadening service to the patient.
2. To augment services to staff and patients which would otherwise be impossible through the routine program and budget of the Hospital.
3. To further the public relations of the Hospital through the message which an active, informed, and satisfied volunteer will carry to others.

Throughout the year there has been an increasing appreciation and understanding of volunteer services. As a result, many new areas have been opened for volunteer work.

The following comparative statistics are of interest:

Year	No. of Volunteers	Hours	Areas
1916	70	12,050	4
1938	85	12,834	7
1950	497	45,180	18
1954	475	48,146	25

There are 34 Volunteers who have served this Hospital for over 5 years; 21 for over 10 years; and 83 completed 100 hours or more this year.

The following educational institutions send Volunteers to us — some of them on a field-training level:

Harvard University
Radcliffe College
Boston University
Simmons College
Tufts College
Bouve School
Bennington College
Garland Junior College
Wheelock College
Wellesley College

Volunteers also come through the Boston Chapter of the American Red Cross and the Junior League of Boston, Inc. Many other individuals are recruited by our own Volunteers and the Hospital personnel.

In picturing the hospital Volunteer at work today, one realizes that planning is a basic prerequisite to effective volunteer service. Thorough indoctrination, observation, on-the-job training, and supervision equip the Volunteers to carry out their responsibilities toward meeting present hospital needs. There are approximately two million hospital beds in the United States. Without the many thousands of volunteers who are regularly giving their time and acquired skills, hospitals could not approach the degree of ideal patient care achieved today.

Here at the M.G.H., the mutual respect between the personnel and the Volunteers has made our record of 85 years of service possible. No matter how small his service might appear to the Volunteer at times, it is the sum total of all these services, contributed *when needed,* that is more than compensating.

VOLUNTEERS ARE HERE TO MAKE TIME LIVE.

Mary Ruth Wolf,
Director of Volunteer Unit

VOLUNTEER GROUPS

MGH STAFF WIVES HOSPITAL COMMITTEE

The Staff Wives are proceeding with their plans to open the Reception Center for the professional visitors to the Hospital—not only for visitors from foreign countries, but for those from other parts of the United States.

A letter will soon go out to each member of the Staff Wives, explaining in detail the plans for the Reception Center, which will be manned by volunteers.

Through the Reception Center the Staff Wives hope to coordinate their efforts toward providing housing hospitality and furniture for the furniture exchange for our visitors from foreign shores.

The Annual Meeting of the Staff Wives will be held on May 3, at 10 A.M., in Bartlett Hall.

The 25th Anniversary of the opening of the Baker Memorial was observed on Thursday, March 3. Some 250 members of the Hospital's staff and employees enjoyed morning coffee and a birthday cake in the Baker Lounge from 9 to 11 o'clock.

The honored guests were Dr. W. Franklin Wood, Director of McLean Hospital, Mrs. Helen H. Cushing, Miss Helen M. Daly, Mr. William J. MacNair, and Miss Walborg L. Peterson, now at the Massachusetts Eye and Ear Infirmary —all of whom were working in the Baker Memorial at the time it was opened and who are still associated with the Massachusetts General Hospital or its affiliates.

Patients were included in the celebration. Birthday card announcements and miniature cakes decorated with the traditional silver brightened their dinner trays.

The Baker Memorial was made possible through the generosity of many friends. Its chief benefactor was Mrs. Mary Rich Richardson who died in 1924. Mrs. Richardson's will provided $1,000,000 to establish a hospital for people of moderate means, as a memorial to her father and mother, Mr. and Mrs. Richard Baker, Jr.

The Board of Trustees, at their meetings on February 18 and March 4, voted:

To accept the resignation of Dr. Theodore L. Badger and to appoint him to the Board of Consultation;
To accept the resignation of Dr. John F. Gibbons, Assistant Radiologist, effective April 2;
To accept the resignation of Dr. Thomas A. Warthin, Assistant Physician;
To grant Dr. Edwin O. Wheeler, Assistant Physician, leave of absence for a period of two years, for service in the U. S. Public Health Service;
To grant courtesy privileges to Drs. Louis I. Skirball, Channing S. Swan, and Roy R. Wheeler.

To appoint:

Dr. Tucker A. Barth as Assistant Resident on the Orthopedic Service, beginning January 1, 1956;
Dr. William R. Blade as Second Assistant Resident in Radiology, beginning January 1, 1956;

Herman DeWilde, D.M.D. as Assistant Dental Surgeon;

Dr. David Gitlin as Assistant to the Children's Medical Service;

Dr. Robert L. Kirkpatrick as Assistant Resident in Surgery, to serve in Baker Memorial and Phillips House from April 1 through June 30;

Dr. Frederick S. McAlpine as Assistant Resident in Anesthesia, beginning July 15;

Dr. Murray E. Pendleton as Assistant to the Children's Medical Service;

Dr. John D. Reeves, Jr. as Assistant Radiologist, beginning April 2;

Dr. Ernest A. Sneddon as Clinical Associate in Anesthesia;

Dr. Mark McN. Walter, Jr. as Assistant in Psychiatry at McLean Hospital.

The Trustees also voted:

To establish the position of Second Assistant Resident on the Children's Medical Service for physicians who have had an internship but who are serving their first year on the Children's Medical Service.

At their meetings on February 16 and 23, and March 9, the General Executive Committee voted:

To promote:

Dr. Richard C. Austin to the position of Resident in Surgery, beginning July 1.

To reappoint:

Dr. John W. Littlefield as Clinical and Research Fellow in Medicine for one year, beginning March 1;

Mr. Thomas F. Lohr as Research Fellow in Anesthesia for one year, beginning February 1;

Dr. Dieter M. Schmid as Research Fellow in Medicine for one year, beginning February 1.

To appoint:

Mr. James U. Casby as Research Fellow in Anesthesia, beginning April 1;

Dr. Oscar Crocker as Graduate Student Assistant in Surgery, effective as of February 1;

Dr. Raymond N. Kjellberg as Clinical and Research Fellow in Neurosurgery, for the period March 1 through June 30;

Dr. Harry H. Korrodi as Clinical Fellow in Medicine, effective as of the date when he obtains a temporary license;

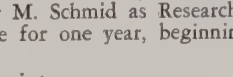
Dr. Luis Landa as Clinical and Research Fellow in Medicine for one year, beginning March 1;

Dr. Munir H. Shamma'a as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Richard Thors as Clinical and Research Fellow in Surgery, effective as of February 5.

The General Executive Committee also voted:

That the title of Dr. Bryan Williams, Jr. be changed from Clinical Fellow in Medicine to that of Clinical Assistant in Medicine, effective as of March 1.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. Again this month, and despite the fact that this request has been made in each issue of THE NEWS for over four years — ever since we started this column — several authors still failed to include that information.

Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Dermatology

Lever, W. F., Herbst, F. S. M., and Hurley, N. A.
Idiopathic hyperlipemia and primary hypercholesteremic xanthomatosis. IV. Effects of prolonged administration of heparin on serum lipids in idiopathic hyperlipemia.
A.M.A. Arch. Dermat. 71:150-157.

Lever, W. F., Herbst, F. S. M., and Lyons, M. E.
Idiopathic hyperlipemia and primary hypercholesteremic xanthomatosis. V. Analysis of serum lipoproteins by means of ultracentrifuge before and after administration of heparin.
A.M.A. Arch. Dermat. 71:158-171.

Gynecology and Obstetrics

Graham, J. B., and Graham, R. M.
The curability of regional lymph node metastases in cancer of the uterine cervix.
Surg., Gynec. & Obst. 100:149-155.

Graham, R. M., and Goldie, K. R.
Prognosis in irradiated cancer of the cervix by measurement of cell size in the vaginal smear.
Cancer 8:71-77.

Graham, R. M., and Graham, J. B.
Cytological prognosis in cancer of the uterine cervix treated radiologically.
Cancer 8:59-70.

Laboratory Science

Schmid, K.
Isolation of a group of alpha_2-glycoproteins from human plasma.
J. Am. Chem. Soc. 77:742-745.

Neurology, Neurosurgery, and Psychiatry

Bakay, L.
Studies on blood-brain barrier with radioactive phosphorus. V. Effect of cerebral injuries and infarction on the barrier.
A.M.A. Arch. Neurol. & Psychiat. 73:2-12.

Benda, C. E.
The role of neuropathology in modern anthropology.
J. Neuropath. & Exper. Neurol. 14:1-10.

Benda, C. E., and Mann, G. V.
The serum cholesterol and lipoprotein levels in mongolism.
J. Pediat. 46:49-53.

Ophthalmology

Murphy, J. T., Allen, H. F., and Mangiaracine, A. B.
Preparation, sterilization, and preservation of ophthalmic solutions: Experimental studies and a practical method.
A.M.A. Arch. Ophth. 53:63-78.

Pathology

Collins, H. D., and Dudley, H. R.
Agammaglobulinemia and bronchiectasis: A report of two cases in adults, with autopsy findings.
New England J. Med. 252:255-259.

Urology

Leadbetter, W. F.
The treatment of prostatic cancer.
Modern Med. 23:83-89.

EMOTIONAL FACTORS IN CHILDREN WITH BURNS

During the past year the Surgical Service and the Child Psychiatry Unit have collaborated in a pilot study of emotional factors in the care and management of children hospitalized with burns. Prior to this study, the Surgical Service had been impressed with the psychological factors in severely burned persons during their course of hospitalization. In some patients there were marked and sudden personality changes in the acute stages of the burn injury. This interest of the Surgical Service was shared by the Child Psychiatry Unit, where we had been studying the reactions of children to hospitalization and chronic illness. In line with this interest, several children with severe burns had been observed in the past. A review of these burn cases gave some orientation for the present study.

In January 1954, an attempt was made to study every child admitted to this Hospital because of a burn. Twelve burn children have been studied currently. Six have been seen on an intensive basis, and the remaining six were seen only for psychiatric evaluation. Concurrently with the study of the children, the mothers were seen by a social worker who obtained information on:

1. The family background
2. Developmental history of the child
3. Details concerning the burn accident

The following case report illustrates the nature of the case material and the method of study.

Tom was a fifteen-year-old boy, admitted with third degree burns on the left side of his face and left arm. The circumstances surrounding the burn accident were: Tom, who has had epilepsy since age four, had a nocturnal epileptic attack and awoke to find his bed wet. He spread his pajamas on a radiator to dry, but had another "spell", during which his face rested for a few minutes against the hot steam radiator. He was taken to the local hospital, but on the following day was transferred to M.G.H., as it was apparent that skin grafting would be necessary. On the day before this episode, his mother had been admitted to the same local hospital for ligation of varicose veins.

From the beginning of hospitalization, Tom had certain behavioral traits which at first only slightly, but later to a significant degree, seriously hindered his recovery. He was overly independent, suspicious, stubborn, and belligerent. He also had a nervous habit of picking at his face, especially around and underneath the edge of his bandage, with apparent disregard for the underlying wound.

During the next month and a half he underwent three skin grafting procedures. His behavior during this time became increasingly belligerent toward nurses and other patients. He threatened to kill one nurse. He tried to tear his bandage from his face on the day after one operation, and continually picked at the underlying wound. At the end of three grafting procedures there had been little successful take. His lower eyelid was forming a marked ectropion and his lip was drawn upward. At this point Tom had antagonized almost everybody. His interpersonal relationships were characterized by marked hostility, with strong self-destructive trends. To understand this, some knowledge of his background is necessary.

Tom lived at home with his mother, age thirty-five, and younger brother, age eleven. When Tom was two, an eight-months-old sister died. At the age of four a brother was born, following which his epilepsy started. When Tom was eight his father abandoned the family and went to live with another woman. At first he would see his father once or twice a year, but has not seen him for the past two years. After his father left, Tom became a behavior problem. He was seen infrequently at a child guidance center because of aggressive behavior toward his mother, as well as for his epilepsy.

In his psychiatric interviews Tom was initially suspicious and depressed, and he kept the therapist at a distance. He gradually talked more freely, spoke of his father, who had left five years ago, and of his mother, who was in the hospital.

In subsequent interviews he told with great feeling about his parents' divorce. He felt caught in the middle, wanting to like both parents and not wanting to take sides. When Tom went to the operating room for grafting procedures, his therapist went with him and remained until he was under anesthesia. He talked in a very anxious way about his absent father, and about his mother, who was in a hospital, too. He said that his real trouble was with his "spells" — his spells would kill him some day. After the second operation he said that he felt his burn was caused by a faint and not a spell. He said that he had ideas in his head that hurt him and he could not stand it to have these ideas, but he would not elaborate. He spoke also of several times when he had run away from home. He said angrily that his mother would never tell him where his father was, yet if he wrote a letter to him she would see that it was mailed. Tom felt her to be a censor in his relationship with his father. Periods of depression, with poor food intake, became more prominent.

At this point, because of the failure of three grafting procedures, a conference was held between the surgeons, pediatricians, and psychiatrists. It was felt that destructive trends in Tom's personality drove him to destroy the operative result. Feelings of guilt in Tom derived from his intense hostility toward his mother, and this hostility he redirected toward himself through destruction of the grafts. This was repeatedly interpreted to him. Following this conference a fourth operation was quite successful, due to Tom's insight, more understanding of Tom's problems on the part of hospital personnel, and to the special arrangements which were made to have his mother present on the day of the operation. On the third day after this operation, his mother visited here with a man who was a stranger to Tom. Although he had been unusually calm, on this day Tom became aggressive, refused to stay in bed, and began picking at his bandage. When questioned on this by his therapist, Tom asked, "Is this the way you mean I punish myself and destroy the grafts?"

Following discharge from the Hospital, Tom was seen approximately once per month. His hostile aggressive behavior toward his mother continued, and reached the point where placement outside his home seemed necessary. He has returned to the Hospital twice for further plastic procedures, but was in no way the behavior problem he had been earlier.

DESCRIPTION OF CASE MATERIAL

The clinical cases consist of eighteen burned children — twelve cases seen currently and six seen in previous years. Sixteen of the patients are boys and two are girls. The range in age is from nine months to seventeen years, with the following age grouping:

0-4 years — 5 6-11 years — 4
4-6 years — 2 11-17 years — 7

The severity of the burns varied from small minor burns, admitted only because of secondary infection, to major third degree burns involving large body areas, in which there was a serious threat to life. In thirteen cases, at least one, and often several, skin grafting procedures were necessary. The period of hospitalization varied from five days to fifteen months, with ten of the cases being hospitalized for a month or longer.

On the basis of psychiatric evaluation of the family unit and the child, the cases have been divided into three groups. The first subgroup, consisting of eight cases, is characterized by little or no evidence of serious emotional disturbance either in the family or in the child. The second subgroup of four patients is characterized by significant abnormalities in the family group, but with too little information regarding the personality of the child to make an adequate assessment of the adjustment. The third subgroup of six cases is characterized by significantly abnormal personality traits in the child which antedated the burn accident, and which often interfered with his medical and surgical management. In this last group there is also a disturbed family background.

In Group I, both parents were present in the home, and their marriage appeared to be stable.

In Group II, the period of hospitalization was too brief for intensive study, but evaluation interviews showed a family broken by death, desertion, or divorce. One twelve-year-old boy was admitted with a small third degree burn on his right arm where he had dropped some molten lead prepared for making a "Bull's Head" — an instrument used to wrap around one's knuckles in a fight. In the Emergency Ward he was anxious and afraid. When encouraged to talk, he broke into tears and said his father had died in this Hospital five years ago. Throughout this boy's hospital stay he referred to doctors as "butchers" and to the Hospital as "a prison". Subsequently it was learned that the father had died five years ago at the Massachusetts General Hospital from cancer of the lungs. The father had remained at his home until the very terminal stages of his carcinoma, was in a depressed state, and at one point had tried to commit suicide by gas.

Another twelve-year-old boy was admitted with a small infected burn on the dorsum of his left hand. His father was in jail because of attempted murder. This had occurred when the patient was three, and he had learned all the facts about his father when he was seven. His family refused psychiatric help, feeling this would be an admission of insanity.

A two-year-old boy was admitted because of minor burns. He came from a family where the father had deserted, and where an older brother and sister were in a reform school.

A boy who had had a severe facial burn when he was five years old was seen at age seventeen because of anxiety symptoms and school failure. Although the intervening years and other conflicts had obscured the effect of the burn on his personality, he is included because after many years of discord his parents had been divorced when the patient was fifteen. The discord had existed at the time of his burn injury.

In this group of four cases it is felt that the three boys whose burns were of recent occurrence will have significant problems of adjustment in their later years.

In Group III, all had evidence of emotional disturbance prior to the burn. The detailed case report already given belongs to this group.

One thirteen-year-old boy was admitted to the Hospital as a transfer from another hospital where he had been for six months. Despite numerous grafting procedures, there were still large uncovered areas of skin. His burn occurred when his oil-soaked trousers were ignited from a fire where he was warming himself. Both of his parents were alcoholic and he had been taken from them by court order. At various foster homes he had shown marked aggressive and, at times, destructive behavior, with several episodes of stealing. The burn occurred when he had left a new foster home to visit a former home that he had liked better.

A five-year-old boy was admitted with a fifteen percent burn of the trousers area incurred while tramping out a brush fire which he and some other boys had set. His parents appeared to be stable persons, but the patient had shown a sudden change in his personality following the birth of a sibling, one year prior to admission. This consisted of temper tantrums, irritability, disobedience, and repeated playing with matches.

One twelve-year-old boy was admitted with electrical burns of his right arm and scalp, requiring a subsequent amputation of his arm. The accident had occurred in the following manner: After illegally entering a school and climbing to the roof where he had found a birds' nest with eggs, which he promptly rolled from the roof to the ground, he remembered another nest in a tower which supported high-tension wires. In climbing the tower he fell, landing on some of the wires, breaking his fall but burning himself severely. During his hospital stay, after amputation of his arm, and with full awareness of a defect in his skull, he became angry with his therapist during one interview and jumped on a chair, from there to the window sill, and thence to a rickety table — all with an air of carelessness, as if inviting another fall.

Another ten-year-old boy was admitted with a severe burn involving his legs and trunk up to mid-chest. The burn had occurred while playing with matches around an oil drum. This boy had played with matches for years, against his parents' advice. He was caught stealing on several occasions, and had been before the Youth Service Board for breaking and entering at the local library, where he had stolen some pictures and a viewer. There was considerable marital difficulty in the family. The father had a history of alcoholism and had been arrested several times.

A ten-year-old boy was admitted with third degree burns of both lower legs, incurred while playing with matches and gasoline. He is the second oldest of four children, with an older brother, and a younger brother and sister, age seven, who are twins. At the age of two and one-half, when the mother was pregnant with the twins, the patient set a fire in the kitchen while the family was asleep, causing the house to burn. At age six, a bottle he had thrown into a fire exploded, irreparably damaging his right eye. At eight, he set the woods behind his house on fire. His father was a disturbed person, and was intoxicated on the day the patient was admitted to M.G.H. When the father was a boy, he had been left in charge of his younger brother at the beach, and this brother had drowned. The father had apparently never forgotten this, as it was among the first remarks he made to the social worker. This patient's hospital course was unusual, in that he was such a good patient. He did not complain about the dressing changes or operative procedures, but rather, as one nurse observed, he seemed to enjoy them. When he fell out of bed once he remained uncomplaining on the floor, reading a comic book until discovered. In this case, though his need for punishment aided his recovery, it was indicative, in view of his past, of serious emotional disturbance. One would feel better about him had he complained more.

SUMMARY AND DISCUSSION

In this small number of cases an evaluation of the psychological findings relevant to the family unit and to the child resulted in the cases being divided into three subgroups.

Group I (8 children)

These cases are characterized by an intact family unit, with both parents demonstrating a degree of stability and maturity not found in parents of Groups II and III. There were no delinquent or other grossly abnormal personality traits in the child prior to the burn injury and, with the exception of one case, these children adjusted well to their hospitalization.

Group II (4 children)

These cases are characterized by too little information for adequate psychiatric evaluation. However, all these families were broken by death, desertion, or divorce of the father, and it is felt that these children will all have significant problems of adjustment in later life.

Group III (6 children)

This group is characterized by gross personality disturbance in the child prior to his injury. This included delinquent behavior, stealing, and fire-setting. In five of these cases their disturbed personality was a significant factor in managing their adjustment to the Hospital and to treatment procedures. In four of these cases there was severe disturbance within the family unit.

In bringing together the factors of a disturbed family group and emotional difficulty in the child, a causal relationship to the burn accident is not implied. Not all children of broken homes and with emotional difficulty do show this self-destructive tendency. Rather, one would think of a confluence of events, such as the birth of a sibling or pregnancy of the mother, in a family group where there is excessive interpersonal tension, and where the child is a vulnerable person in his having shown previous personality difficulties. It seems significant that, of these eighteen burned children, eight should come from seriously disturbed family groups and six should show predelinquent or self-destructive behavior. In view of this, it seems justified to raise the question with all children treated for burns: Is there a more serious situation in this child's family setting which has led, in part, to this burn injury?

Disturbed reactions to hospitalization and treatment deserve consideration. Though the cases are too few, reactions to hospitalization can be viewed as a spectrum. In the middle of the spectrum are the "normal" cases, where mild depressive reactions, anxiety, and infantile behavior are not uncommon. Such reactions are perhaps incident to separation from parents, as much as to the injury itself. There is moderate complaining and uncooperativeness toward treatment procedures, but with ultimate compliance for their own benefit.

At one end of the spectrum would be those cases obviously disturbed. These show moderate depression and feeding problems, with open aggressive, and at times assaultive, behavior toward personnel, and only slightly veiled or overt self-destructive acts.

At the other end of the spectrum would be those cases where, in their excessive compliance and goodness, they mask more deeply seated personality trends of self-punishment and passivity. Although treatment of their burns is thereby helped, deeper emotional conflicts may be left untouched unless they are recognized.

Robert T. Long, M.D.,
Assistant in Psychiatry

Brief bits:—

Dr. Walter S. Burrage participated in the conference on "Hydrocortisone, its newer analogs and aldosterone as therapeutic agents", sponsored by the New York Academy of Sciences, on January 26 and 27. His topic was "Hydrocortisone in the therapy of asthma". On February 7, Dr. Burrage presented a paper on "Cortisone or hydrocortisone in the treatment of severe, intractable asthma", at the 11th Annual Meeting of the American Academy of Allergy in New York. On March 8, Dr. Burrage addressed the Georgia Medical Society, at its Centennial Anniversary Meeting in Savannah. His subject was "Allergy in Medicine".

Dr. Benjamin Castleman addressed the Academy of Medicine of Cincinnati on February 15. His subject was "Clinico-pathological aspects of parathyroid disease".

Dr. Edwin F. Cave attended the Sectional Meeting of the American College of Surgeons in Cleveland on February 24, and lectured on "Fractures of the wrist" and "Meniscal injuries of the knee".

Dr. Fletcher H. Colby was elected President of the Clinical Society of Genito-Urinary Surgeons at their meeting in Richmond, Virginia, on February 4.

Dr. John W. Irwin spoke on "The use of intravenous hydrocortisone in asthma" at the January meeting of the New York Academy of Sciences.

Dr. Laurence L. Robbins has been elected to the Board of Chancellors of the American College of Radiology.

Dr. Carter R. Rowe attended the February meeting of the American Academy of Orthopedic Surgeons, held in Los Angeles, and presented a paper on "Prognosis in dislocation of the shoulder".

New addresses:—

Dr. Henry H. Banks (a.r.s. *Or.* 1952), 1093 Beacon St., Brookline, Mass.
Dr. John F. Burke (*S.* 1952), Lister Institute of Preventive Medicine, Chelsea Bridge Rd., London S.W. 1, England
Dr. Richard A. Currie (*S.* 1950), 55 Cornwall Ave., Town of Mount Royal, Quebec, Canada
Dr. W. Hardy Hendren, III (*S.* 1953), Children's Medical Center, Boston, Mass.
Dr. Merrill J. King (*Oph.* 1932), 22 White St., Rockland, Maine
Dr. Farahe Maloof (a.r.p. 1952), 264 Beacon St., Boston, Mass.
Dr. Carlo A. Montagnani (res. fel. *S.* 1950), Clinica Chirurgica Pediatrica, Ospedale Meyer, Firenze, Italy
Dr. Russell M. Nelson (a.r.s. 1954), 974 13th St., East, Salt Lake City 5, Utah
Dr. Paul S. Russell, Jr. (*S.* 1949), Dept. of Zoology, University College, Dower St., London, England
Dr. James M. Shannon (*S.* 1948), 31 Chestnut St., Salem, Mass.
Dr. Robert S. Shaw (*W.S.* 1946), 264 Beacon St., Boston, Mass.
Dr. J. Garland Wood, Jr. (clin. fel. *R.* 1950), Radiology Dept., Jefferson-Hillman Hospital, Birmingham, Ala.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. David D. Donaldson was named last month as winner of the 1954 Award given by the New England Ophthalmological Society for "the most valuable contribution in ophthalmic science by a resident of New England". This prize was inaugurated in 1950, and since then it has been awarded four times — each time to a member of the Infirmary staff. It was first given to Dr. W. Morton Grant, and then to Dr. Paul A. Chandler, and to Dr. David G. Cogan.

Dr. Donaldson finished his residency here in 1953, after which he returned to his work in the Howe Laboratory of Ophthalmology. He has just been appointed Assistant in Ophthalmology on the Infirmary staff.

Dr. Donaldson has perfected a stereoscopic camera with which he has made a unique collection of photographs of the angle of the anterior chamber of the eye. It is probable that advances in the understanding of glaucoma and other eye diseases will be made possible through his work of correlating the photographic findings with clinical aspects of the eye. In both 1950 and 1954, Dr. Donaldson was given the Blue Ribbon Award by the American Academy of Ophthalmology and Otolaryngology for his exhibits of stereophotographs of the eye.

Dr. Piero Perone completed his residency in Otolaryngology on March 15, and has returned to his home in Livorno, Italy.

Leona Zacharias, Ph.D., Head of the Retrolental Fibroplasia Study Group, lectured before the nurse interns of the Boston Lying-in Hospital on March 15, and again before the parents of blind children at the Perkins Institution for the Blind on March 17.

On February 28, Mr. Alan S. Feldman, Audiologist for the Winthrop Foundation for the Deaf, spoke before the Brookline Dental Society on "The relationship between speech pathology and dentistry".

Dr. Edwin B. Dunphy, Chief of Ophthalmology, lectured before the Yale Medical School Postgraduate Course on March 25 on "Diagnosis of malignant ocular tumors by radioactive phosphorus".

Dr. Daniel Miller presented a paper on "Cancer of the external auditory meatus" at the spring meeting of the American Trilogical Society, held on March 17 at the Hollywood Beach Hotel in Hollywood, Florida. Other members of the Infirmary staff who attended the meeting included Dr. LeRoy A. Schall and Dr. Moses H. Lurie.

Recent Staff changes:

Dr. Wallace F. Friedman, formerly of the Retina Service, is studying in Europe on a fellowship, and will return to the Infirmary in July.

Dr. Alfred Hurst, Resident in Otolaryngology, left last month to serve with the Air Force.

Dr. Albert Weiser has been appointed a Graduate Assistant in Otolaryngology.

Dr. Akira Sakudo has been appointed as Resident in Otolaryngology, and is now in the ENT Clinic and the Mosher Laboratory.

Dr. Ariah Schwartz has been appointed a Fellow in Ophthalmology, and at present is with the Retina Service.

The editor of THE NEWS has received a nice note from Dr. John D. Ragan (r. *Oph.* 1954):

> I should very much enjoy receiving THE NEWS at my new address—220 Vancouver Block, 736 Granville Street, Vancouver 2, British Columbia.
>
> Starting out in practice has little of the anticipated pleasures and many more tribulations than one ever expects. However, there are those who say that the tribulations will all "resolve into a dew", and let's hope they do! My practice is but a month old and one should scarcely expect it to be sitting up, let alone walking.
>
> It is most pleasant in Vancouver (when it isn't raining), and one can see snow on the mountains across the bay and boats plying their trade in and out of the harbor. There are so many things to do here that one needs only the inclination.
>
> Still, I cannot help but miss the companionship and sense of family ties with the MGH community. I hope to return in May for the annual reunion meeting.

BIOGLETS

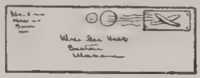
Dr. Norman W. Andrew, Assistant Resident in Anesthesia—born in Lawrence, Massachusetts, July 1, 1925; Lieutenant (jg), U.S.N.R., Communications Officer on destroyers, and Medical Corps (inactive), 1943-46; B.S., Tufts College, 1947; M.D., Tufts College Medical School, 1951; Intern in Medicine, Boston City Hospital, 1951-52; Assistant Resident in Surgery, Cleveland City Hospital, 1952-53; Assistant Resident in Medicine, Boston City Hospital, 1953-54.

Dr. Robert L. Brent, Intern in Children's Medicine—born in Rochester, N. Y., October 6, 1927; Research Associate, U.S. Atomic Energy Commission, Rochester, 1947; Laboratory Instructor, University of Rochester University School, Department of Biology, 1947-48; Research Assistant, University of Rochester, Physics Department, 1948-49; M.D., University of Rochester Medical School, 1953; Ph.D., University of Rochester Graduate School, 1954.

Dr. John W. Hayden, Assistant Resident in Orthopedic Surgery—born in Buffalo, N. Y., October 3, 1922; A.B., Hamilton College, Clinton, N. Y., 1943; M.D., Syracuse University College of Medicine, 1947; Intern in Pathology, Strong Memorial Hospital, Rochester, N. Y., 1947; Intern and Assistant Resident in General Surgery, Strong Memorial and Genesee Hospitals, 1948-51; U.S. Navy: St. Albans, N. Y., carrier *Midway* in Atlantic and Mediterranean areas, and Naval Academy, Annapolis, 1951-53; Assistant Resident, Orthopedic Surgery, Children's Medical Center, Boston, 1953-54; married; two children.

Dr. Mark R. Knapp, Assistant Resident in Anesthesia—born in New York City, November 10, 1923; B.A., Kenyon College, Gambier, Ohio, 1945; M.D., New York University College of Medicine, 1947; Intern, Kings County Hospital, Brooklyn, N. Y., 1947-49; private practice in La Plata, Missouri, 1949-51; Captain, U.S.A.F., Eglin Air Force Base, 1951-53; married; three children.

Dr. William E. Lassiter, Intern in Medicine—born in Wilmington, North Carolina, July 21, 1927; U.S. Navy: 1945-46; A.B., Harvard College, 1950; M.D., Harvard Medical School, 1954; home: Wilmington, North Carolina.



Another "singleton" has responded to our appeal for news concerning himself. (For those newcomers to the Hospital who may not understand what we mean by "singleton" — we have conferred that title upon those doctors who are the only MGH-ers practising in their particular communities.)

This letter is from Dr. Frank P. Gaunt (*W.S.* 1913), whose office is in Webster Groves, Missouri. He writes:

> It's a good many years since I was a House Pupil at M.G.H., but I recall that we did hustle around pretty lively on West Surgical in 1911-13.
>
> Drs. Hugh Williams, George W. W. Brewster, William M. Conant and others did their work so well that even now their appendix or gallbladder technique could compete with that of any modern surgeons and excel many of them.
>
> It would be a pleasure to greet Drs. Crabtree, White, Means, Marble and the others of my class personally, but next best is through THE NEWS.
>
> I went from the M.G.H. to China, taking my bride on that unusual honeymoon. We worked in hospitals in China before the days of the Communists.
>
> Three of our children were born in China and one in America. Both of our two sons are doctors. The elder chose Marissa, Illinois (population 1700) and loves being a country doctor. The younger son is specializing in internal medicine and is now entering his third year as a fellow at the Mayo Clinic. He recently completed two years' service in an Air Force hospital in France.
>
> We are blessed with eleven grandchildren. They are great fun, and we enjoy teaching them to swim.
>
> My work now is mostly general practice and office surgery, but I keep pretty busy.
>
> Best greetings to the Class of 1913.

This nice letter has come from Lt. Herbert L. Kraut, MC, USAF (a.r.p. *D.*), whose present address is 6110 USAF Hospital, APO 1054, c/o Postmaster, San Francisco, California:

> I have finally settled down long enough to send and receive mail, and I can now answer your pleasant letter, exchanging a whiff of Japanese air for the clean scent of Boston which your letter brought with it. Truly, a letter from Home!
>
> I accepted my commission on 5 September 1954; was called to active duty on 27 November 1954; spent three weeks at Gunter Air Force Base in Montgomery, Alabama, learning what the Air Force feels "Every Young Doctor Should Know"; then drove to

THE BAKER MEMORIAL 25TH BIRTHDAY PARTY

Left to right: Dr. Ellsworth T. Neumann, Dr. Dean A. Clark, Miss Walborg L. Peterson, Dr. W. Franklin Wood, Mrs. Helen H. Cushing, Miss Helen M. Daly, Miss Josephine C. Barbour, and Mr. William J. MacNair

Parks Air Force Base, from which I was sent to Tokyo; then to my present station in Nagoya, at a 200-bed hospital on the premises of what used to be the Japanese Central Communications Building during the war.

I don't know of any fellow MGH-ers here, but would be delighted to learn of any and to hear from and about MGH-ers via letters and the MGH NEWS.

♧ ♧ ♧

HISTORY OF THE BAKER MEMORIAL LABORATORY

The Hospital division known as the Baker Memorial Laboratory is more than a laboratory providing services to private patients. In addition to these obvious duties, it is the administrative and training unit for all clinical laboratory work in the Hospital, other than that performed by the professional staff.

What is referred to as clinical laboratory work includes certain minor chemical procedures, but the art of science of the work done by the clinical technician involves the use of the microscope.

Historically, the Baker Memorial Laboratory was the direct outgrowth of a tiny laboratory on the second floor of the Phillips House. In tradition, it had a much more distinguished beginning.

The first clinical pathologist appointed was Dr. John Bacon, Jr., in 1851. Although his duties would more closely coincide with those of the present Baker Laboratory, he is claimed by our chemists as the founder of their department. His official title was Chemist-Microscopist. Microscopy and chemistry were separated in 1871 with the appointment of Dr. Reginald H. Fitz as Microscopist. In 1894, Dr. Richard C. Cabot was appointed as Clinical Hematologist. The Pathologist of this period, Dr. James Homer Wright, also made many contributions to clinical hematology. In 1896, a central laboratory in the present location of the Pathology Laboratory was opened. In those days it was known as the Clinical Pathological Laboratory. The subsequent fate of the clinical component of this department is a mystery. From 1917 to 1927 what clinical microscopy was done, other than by the professional staff, was done by unsupervised technicians in widely dispersed small laboratories.

In 1927, it was felt that an important area of medicine had been long neglected at the Massachusetts General Hospital. Therefore, a physician with considerable interest and experience in hematology was put in charge of the one technician in the Phillips House. It was stated that "his salary was small, his duties commensurate with the salary." The man selected was Dr. Francis T. Hunter. Dr. Hunter, who had recently graduated from the West Medical Service, had also done extensive work in hematology with Dr. George R. Minot at the Collis P. Huntington Memorial Hospital. When the Baker Memorial Hospital opened its doors on March 3, 1930, Dr. Hunter and three technicians organized a new laboratory on the second floor of the new building. The Phillips House laboratory was closed in 1933 and its technician incorporated into the Baker team.

The early growth of the Laboratory was rapid. In 1931, an extra duty was added — that of keeping the professional blood donor list up to date, with frequent checks on the grouping and serology.

In 1931, arrangements were made for emergency Laboratory coverage for nights and week ends by medical students. This service was continued until 1942, and resumed again in 1952.

In 1934, the laboratory service of the Out-Patient Department was made the responsibility of the central Laboratory and the present chief technician, Miss Ellen Wood, replaced Mrs. Hickey.

In 1940, laboratory coverage for the surgical specialty services in the White Building was added to the other duties.

The opening of the Blood Bank in 1942 removed the professional donor work. This loss, however, was more than offset by the rapid development of blood chemistry that has taken place since the war.

The last added duties were for the private floors of the Vincent Memorial and the Burnham Memorial Hospitals in 1948.

The increase in the load of work in the Baker Memorial and Phillips House, not to speak of the numerous other duties, brought about a serious shortage of space. Although eight technicians were needed, only six microscopes were provided because there was room for only six people to work at one time. Dr. Hunter described a scene on December 28, 1937, in which fifteen blood donors were forced to sit on the stairs for several hours before they could be accommodated inside the Laboratory.

The space shortage was improved in 1938, when a room formerly used as quarters for the Eye and Ear residents was annexed. The acquisition of this room does not seem to have been uncontested, since it remained unused for a year before it was finally given to the Laboratory. It is said that although unused, beds were regularly made up and the towels frequently changed.

During Dr. Hunter's absence for Naval Service between 1942 and 1945, the Laboratory was efficiently directed by the late Dr. Wyman Richardson.

Since Dr. Hunter's untimely death last year, the Baker Laboratory has been supervised by Dr. Charles H. DuToit, who also directs the Chemistry Laboratory.

Dr. Hunter's many scientific contributions made in the Baker Laboratory were the subject of an article in the December 1954 issue of THE NEWS. This was the first laboratory to make extensive use of photoelectric hemoglobin measurements. Because of Dr. Hunter's special interests, the Laboratory was the center of spectroscopic and spectrophotometric work throughout the Hospital. Under the Robert Nye Fund, methods were developed for estimating the degree of exposure of x-ray personnel. Dr. Hunter worked tirelessly to promote the standards and working conditions of the laboratory technicians. The medical profession at large appeared relatively apathetic toward the importance of good laboratory work. As a result, this occupation lost its appeal to the type of individual with the education and integrity needed for satisfactory service. From 1946 to 1949, personnel shortage seriously threatened the operation of all laboratory services. However, in 1949, Dr. Hunter and Miss Wood were again able to recruit a first-class laboratory team.

Since 1949, the Baker Laboratory has maintained one of the Hospital's best records for the loyalty and stability of its organization. Many other institutions have not been so fortunate.

Charles H. DuToit, M.D.,
Assistant Physician

THE NEWS

No. 145 Boston, Mass. May 1955

OTOLARYNGOLOGY DEPARTMENT

Beginning last October, the Fruit Street activity—at first the excavations, the huge cranes, the steel girders, and now the scaffolding, the bricks, and the mortar—is producing a changing skyline in this area. The new laboratory facilities of the Massachusetts Eye and Ear Infirmary are under construction. This is the second phase of our long-range planning. The first was the face-lifting operation performed on our old building by the addition of a new floor and the modernization of our operating rooms, our wards, and our out-patient clinics. By the addition of three new floors to our present connecting building, we expect to greatly expand our laboratory facilities. We expect to occupy the new quarters this coming fall. The third phase which must be faced in the near future is a provision for increased private-room facilities. This may be resolved either by a building connecting with the Phillips House or by a new wing which would replace the old Gardner Building.

In the light of modern-day medicine, it seems incredible to look back to our facilities of fifteen years ago. In 1939 it was part of the residents' duties to do all laboratory procedures. These were limited to urinalyses and blood counts. Bacteriology was practically nonexistent. Tissue diagnosis was done in the laboratories of the Massachusetts General Hospital. Research was at a minimum. Dr. Harris P. Mosher studied the esophagus, and Dr. Moses H. Lurie worked on the temporal bone.

With the advent of the antibiotics, bacteriological service was essential; and in 1940, under Mr. Thomas Blake, we established our first bacteriological laboratory. When Miss Anita B. Mangiaracine, our present bacteriologist, became available upon the closing of Dr. Champ Lyons's laboratory, we were most fortunate in obtaining her services. Under Miss Mangiaracine's direction, our bacteriological service has become outstanding. It is indispensable in aiding us in the antibiotic treatment of diseases of the ear, nose, and throat.

The Mosher Laboratory, under the direction of Dr. Werner Mueller, has also proved to be of utmost value. Here, in addition to routine laboratory tests, all surgical material is prepared for pathological study; and Dr. Mueller is available, at all times, to the members of the staff who wish to discuss problems in pathological diagnosis. The first training of all residents in otolaryngology is given in Mosher Laboratory.

Research activities and problems

Advances in the treatment of viral diseases affecting the nose and throat have not kept pace with advances in surgery and medicine. Because of the lag, it was felt that a laboratory should be established and dedicated to increasing the body of knowledge regarding these viruses. This idea was translated into reality, and in July 1952 the Virus Research Laboratory came into being. Dr. Robert S. Gohd, who came from the Department of Bacteriology, Harvard Medical School, assumed the responsibility of outfitting a laboratory and for developing a program of research. Quarters to house the laboratory appropriately were provided by three infectious disease isolation units on the second floor of the old Gardner Building. By November of the same year, the physical plant was equipped and was functioning as a research arm of the Department of Otolaryngology.

The common cold is the virus that attacks the upper respiratory tract most frequently. Accordingly, a large portion of the research program of the Virus Laboratory is devoted to the common cold problem. The heart of the problem lies in the fact that there are as yet no research tools available for the study of this virus. Therefore, a study was directed toward the development of such tools as would facilitate the isolation and investigations of the cold.

In the course of this investigation, adenoids from ostensibly normal individuals were grafted to membranes of chick embryos. It was found that certain of the adenoids contained a factor that caused a marked stimulation of embryonic epithelium. The factor was small, soluble, and filterable substance, and, in some respects, resembled an infectious agent. The relationship between this factor and the newly recognized "adenoidal-conjunctival" viruses is being explored.

The recent development of methods of tissue culture and its successful application to virus research in polio and influenza have opened new areas of investigation. In the Virus Laboratory human tonsillar, adenoid, and turbinate tissues are grown in tissue culture. The effect of cold virus on squamous and ciliated epithelium, fibroblasts, and mucous glands derived from the nasopharyngeal tissues is being studied currently.

Another basic study of the Virus Laboratory is concerned with the influenza virus. This investigation is directed toward elucidation of nutritional factors required by tissue for the production of influenza in tissue culture. It has been found that the element calcium is essential for the multiplication of virus. In cultures, the binding of calcium by EDTA (ethylenediamine tetra acetic acid) or by phosphate prevents the normal growth of influenza. Addition of more calcium reversed the inhibition.

Another field of laryngological research concerns the possibility of papillomata of the larynx having a virus factor in its etiology. This, too, is under investigation.

Pathological research by Dr. George Kelemen in the Mosher Laboratory has included an ample variety of problems centered around the ear and the upper airways. In investigations on pathology of the hearing organ, a simplified method of microscopy under polarization helped in the discovery of an otosclerotic focus outside the otic capsule—an extremely rare finding. The rich material on injuries of the temporal bone resulted in an exhibit at the American Academy of Ophthalmology and Otolaryngology, while osteomyelitis studies formed the basis of a chapter in a textbook on otolaryngology, now in press. Meanwhile, the steady growths of temporal bones sectioned into continuous series—now over 70—are inviting everyone to use this opportunity to study the endless problems of aural pathology. This unusually rich material was utilized in instruction courses given at the Academy, and from it the selection of sections was made which is now the "official" test series in aural pathology in the examinations by the American Board of Otolaryngology. Delving into the past and remembering the important contributions of this department, beginning in the nineties of the past century, a historical bibliography of the fenestration operation on the labyrinth has been published.

One of the chapters of highest interest in the field of aural pathology deals with congenital deafness. While clinical data for many conditions resulting in a similar defect are known in abundance, their pathological basis is far from being firmly established, excepting, maybe, the truly hereditary forms. Consequently, attention has been focused on damage suffered by the progeny *in utero*. The difficulty in obtaining pertinent embryological material is evident. Observation on embryos with rubella and on an embryo of a diabetic mother yielded results which in both cases might be called "firsts". An observation on a very complex aural malformation could be added to these.

Approach to the problem of congenital deafness by animal experimentation was initiated by studying the damage done by x-rays, anoxia, Rh incompatibility, and fluoroacetate poisoning—the last named representing a potent antimitotic agent by enzyme prohibition. This project, together with the clinical experiences mentioned in the previous paragraph, expands rapidly with accumulation of a wide variety of material. As far as can be anticipated from the results of these studies, which are partly published, partly in press, and partly in preparation, the ear claims a quite distinct place among other deformations of the organism, with a tendency to a higher resistance against damaging factors, which are shown, e.g., by the brain or by the eye. Much interesting information is expected from these studies.

The very special knowledge as to the delicate techniques of aural histology continues to yield most satisfactory results, in the hands of our experienced technician, Miss Dorothy Linden.

When the studies on the problem of the pathology of the upper airways in their relation to obesity were started, almost insurmountable handicaps were encountered in spontaneous pathological manifestations in the nasal cavities of the common experimental laboratory animals. To be able to move on a safer basis, extensive investigations were necessary, and are now terminated, on the rat, the guinea pig, and the rabbit, including hereditarily obese animals. The result, even when expected to a certain degree, was a surprising amount of infection, making the evaluation of experimental changes extremely difficult. Moreover, even gross anatomical features hitherto unreported could be added to the factors which make the conclusions of many previous workers very precarious. These tabulations, now at general disposition, will have to be taken into consideration in all studies on the sense of olfaction in physiology and pharmacology, as well as in comparative psychology.

Lymphatic tissue occupies a prominent space in the pathology of the ear and the upper airways. In this direction, applying staining methods worked out for this special scope, the pathway of the tonsillar lymphocyte was followed through the epithelium of the crypts. On the basis of the information gained by these studies, a histological test of the activity of lymphatic tissue was elaborated, demonstrating the degree of participation, in a given period, of a given amount of tonsillar tissue in pathological changes of the surroundings. In connection with these studies, the complicated histological conditions around the pharyngeal orifice of the Eustachian tube are reinvestigated.

These explorations led into the field of geriatrics, with analysis of structure and pathology of the aging tonsil. As a by-product, a new geriatric phenomenon was found: a symmetrical enlargement of the submaxillary glands in advanced age.

Research of the larynx was reopened on the comparative line. The larynx of the chimpanzee offered highly interesting aspects, with peculiarities along the respiratory and phonatory functions. These examinations led to a conception regarding the controversial connection between structure and performance (phonation) in animals. Material for similar analysis of the larynx of the howler monkey is in preparation. As a next step, experience won along this line was applied to elucidate some clinical problems around the origin of congenital laryngeal stridor, in the human newborn.

A historical and analytical survey of the radiography of the supraglottic speech organs has been published, reporting on an important chapter in phoniatrics. A report has been commissioned and prepared—now in press—embracing the last ten years of progress in laryngeal physiology.

A very encouraging feature has been the establishment of collaboration with departments of the Harvard Medical School, departments of Harvard University, hospitals in Boston, and institutions outside our city, besides several departments of the Massachusetts General Hospital. For material furnished and discussion freely given, we are indebted to the following: Departments of Anatomy, Pathology, Obstetrics, and Pediatrics, of the Harvard Medical School; the Harvard School of Public Health; the Long Island Hospital of the City of Boston; the Joslin Clinic; the Departments of Comparative Anatomy, the Psychoacoustic Laboratory, and the Department of Slavic Languages of Harvard University; the Department of Pathology, School of Medicine, University of Illinois; the Department of Comparative Anatomy, School of Medicine, Johns Hopkins University; the Roscoe B. Jackson Memorial Laboratories, Bar Harbor; the Biological Research Station, Woods Hole; and the Curator of the Biological Reservation, Barro Colorado, Panama.

With its rich material and manifold problems, the Mosher Laboratory, which hopes shortly to occupy adequate quarters in the new Laboratory Building of the Massachusetts Eye and Ear Infirmary, is ready to welcome additional workers to participate in a satisfactory and promising activity.

Another laboratory which has been housed in the old Gardner Building and which will welcome the change to our new building is that on Atrophic Rhinitis, under the direction of Dr. Herman J. Sternstein. This disease, which is chronic and progressive, is characterized by an offensive odor, crusting, atrophy, anosmia, and eventual nasal deformity. Although many theories have been advanced since ozena was first described as a distinct clinical entity by Fraenkel in 1876, the exact cause remains unknown. Recent estimates on the morbidity of the disease indicate that it is more prevalent in the United States than is generally believed.

Evidence from Dr. Sternstein's studies suggests that ozena is a "target" disease which should be attacked from many directions, both local and systemic. The majority of cases now being studied show a combination of signs pointing to some subclinical, nutritional deficiency, as well as indications of metabolic and hematological disorders. Dr. Sternstein has enjoyed excellent cooperation from departments of the Massachusetts General in his nutritional, hematological, and metabolic studies. The plans of our Laboratory Building call for a transferral of this laboratory from its present inadequate quarters in Gardner to the new location.

Quarters will also be supplied for the fine, basic research of Dr. Francis L. Weille, in cooperation with Dr. John W. Irwin of the Allergy Clinic, on the vascular structures of the cochlea. For the first time in any laboratory, they have been able to photograph, in moving pictures, the changes in the living small blood vessels of the stria vascularis of the cochlea and to observe changes in those vessels caused by anaphylactic shock and histamine shock. This work has created great interest among the anatomists and the physiologists, and it is basic in the understanding of aural vascular phenomena and the nutrition of the organ of Corti.

The research problems in which Dr. Moses H. Lurie is interested at the present time are the effects of the antibiotics upon the organ of Corti and the vestibular apparatus. As a result of work being done by Dr. Robert Galambos at the Research Center in Bethesda, Maryland, on the possible effect of Rasmussen's bundle on the vestibular apparatus, a complete recheck is now being done of the medulla of the animals which have inherited deafness, in order to determine whether or not there is involvement of this bundle.

We also have a half-dozen whale ears which are to be studied for the work now being done on the noises made by porpoises and whales, in an endeavor to determine whether these animals respond to normal sounds as man hears them or whether they respond to high-frequency sounds. This is a long, tedious project which will take over a year to complete.

The future

In our present inadequate scattered quarters, working under severe handicaps, we are looking forward to the completion of our new laboratory addition. Although we know that many of the great discoveries which have influenced medicine came from small isolated laboratories and that it is the man who produces the results and not the bricks and mortar, it will nevertheless help to fulfill the desires of our Board of Managers to provide better working facilities for our research team.

LeRoy A. Schall, M.D.,
Chief of Otology and Laryngology

Miss Dorothy M. Tarbox, R.N., Director of Nursing and Nursing Education, retired on May 1, after 28 years of service at the Infirmary. A farewell coffee reception was held in her honor in the Surgeons' Parlor on April 28.

Mrs. Althea Brady, R.N. has been selected as the replacement for Miss Tarbox. Mrs. Brady is an MGH School of Nursing graduate, and will receive her M.A. from the Boston University School of Nursing this spring. She has served in varying nursing capacities at both the Infirmary and the M.G.H., and has been on the nursing staff at the Lying-in Hospital in Chicago. She also took a number of nursing courses elsewhere before going to Boston University.

On April 26, the annual Eye and Ear Alumni Meeting was held. Eight papers were presented during the day, the wives of the alumni were taken on a tour of the Infirmary in the afternoon, and in the evening the alumni dinner was held at the Harvard Club. Dr. Francis J. West was the dinner speaker. His subpect was "Of eyes and ears and men". Following this, Dr. LeRoy A. Schall spoke on the distinguished career of the late Dr. Harris P. Mosher, formerly Chief of Otolaryngology.

On April 27, the New England Ophthalmological Society held its monthly meeting, at which Dr. Paul A. Chandler and Dr. Frederick H. Verhoeff were the evening speakers.

Dr. Daniel Miller gave a series of lectures at the 28th annual Spring Congress in Ophthalmology and Otolaryngology of the Gill Memorial Eye, Ear, Nose and Throat Hospital in Roanoke, Virginia, held April 4-9 .

The Buffalo Ophthalmological Society and the Buffalo Eye Bank and Research Society have given their annual award in Ophthalmology to Dr. David D. Donaldson. The award was presented at their meeting on March 10, at which Dr. Donaldson was guest speaker. His topic was "Corneal dystrophies".

Dr. Julio Quedevo of Guatemala, who completed his residency in Otolaryngology here in 1941, has been appointed Professor of Otolaryngology at the University of San Carlos School of Medicine.

Dr. Joaquin Valcarce Avello of Spain is now working in the Howe Laboratory of Ophthalmology, under Dr. David G. Cogan. Dr. Avello came here on March 1, under the auspices of the Institute for International Education, and will remain for several months.

Dr. Lee Garron, Assistant Professor in the Department of Ophthalmology at the University of California, has been visiting here recently. Dr. Garron was formerly a Fellow in Pathology at the Infirmary.

Dr. Joseph L. Dowling, Jr. and Dr. Edward J. Bechtel began their residencies in Ophthalmology on April 1.

Dr. John Renner, graduate student in Otolaryngology, has completed his studies here and returned to his home in Ohio.

Dr. Samran Wangspa, who has been studying here for the past two years, has returned to his home in Bangkok, Thailand.

The Board of Trustees, at their meetings on March 18 and April 1, voted:

To grant six months' leave of absence to Dr. John B. Stanbury, effective as of February 25.

To appoint:

Dr. Phillips Hallowell as Assistant in Anesthesia;
Dr. Ruth C. Haynes as Assistant in Anesthesia;
Dr. Robert H. Richie, Jr. as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. Hermann K. Schueler as Assistant Resident on the Urology Service, beginning July 1;
Dr. Judson A. Smith to the Board of Consultation;
Dr. Elbert P. Tuttle, Jr. as Assistant in Medicine, retroactive to March 15;
Dr. James L. Vanderveen as Assistant in Anesthesia;
Dr. Stephen L. Washburn as Assistant Resident in Psychiatry, beginning July 1;
Dr. Lionelle D. Wells as Clinical Associate in Psychiatry, effective as of March 14.

To appoint the following Interns for one year, beginning July 1:

Medical

Dr. A. Robert Arnstein
Dr. Stephen P. Clement, Jr.
Dr. John R. David
Dr. Roman W. DeSanctis
Dr. Leonard J. Friedman
Dr. Thomas G. Gabuzda
Dr. John F. Heggie
Dr. Charles S. Keevil, Jr.
Dr. John E. Mack
Dr. John T. Monroe, Jr.
Dr. Mitchell T. Rabkin
Dr. Ellis L. Rolett
Dr. Allan I. Sandler
Dr. Charles P. Summerall, III
Dr. Thomas A. Waldmann
Dr. James T. Wheeler

Children's Medical

Dr. John H. Dwyer
Dr. Vassilike A.-C. Forbes
Dr. David B. Shurtleff
Dr. Paul M. Veazey
Dr. Dorothy B. Villee

Surgical

Dr. William G. Austen
Dr. A. Erik Gundersen
Dr. Stephen E. Hedberg
Dr. Charles F. McKhann R
Dr. Donald A. Malt
Dr. Quentin R. Stiles
Dr. Harold C. Urschel
Dr. Clarence G. Wheeler

At their meetings during March and on April 6, the General Executive Committee voted:

To promote Dr. Adolf L. Gundersen to the position of First Assistant Resident in Surgery, beginning April 1.

To extend the appointments of:

Dr. Albert C. England, Jr. as Research Fellow in Neurology, from April 1 through September 30;
Dr. Edward Karamanoukian as Assistant Resident in Dermatology, for an additional six months, ending December 31;
Dr. Alejandro Y. Kuzmanic as Clinical and Research Fellow in Medicine, to June 30;
Dr. Chiu-chen Wang as Research Fellow in Radiology, through June 30.

To reappoint:

Dr. George A. Hyder as Clinical Assistant in Orthopedic Surgery, effective April 1;
Ann Ross, A.B. as Research Fellow in Psychology, for the period March 15 through June 30.

To appoint:

Dr. Ruth B. Beuscher as Clinical Fellow in Psychiatry for one year, beginning July 1;
Dr. Jimmie C. Brockman as Clinical and Research Fellow in Psychiatry, beginning April 1;
Dr. Geoffrey MacD. Coley as Clinical Fellow in Pathology, for a period of six months, beginning July 1;
Dr. Adolfo C. Coussirat as Clinical Fellow in Anesthesia, beginning September 1;
Dr. Spyros G. Macris as Clinical and Research Fellow in Anesthesia, beginning July 1;
Julio Mendizabal, Ph.D. as Research Fellow in Medicine, effective as of March 1;
Dr. Paul H. Nitschke as Graduate Student Assistant in Orthopedic Surgery, beginning March 1;
Dr. Harold S. Novey as Clinical and Research Fellow in Medicine, assigned to Allergy, for one year, beginning August 1;
Dr. William J. Williams as Research Fellow in Pathology, for a period of four months, beginning March 1.

* * *

FRACTURE CLINIC

The last report from the MGH Fracture Clinic published in The News was seven years ago, in February 1948. Since that time the Clinic has continued to be as active as ever and has fulfilled the purposes for which it was established in 1917, namely: 1) segregation and adequate care of patients with injury, 2) instruction to undergraduate and postgraduate students, 3) research and publication of papers by members of the Visiting and House Staffs. The Visiting Staff is made up of representatives from the Orthopedic Service, the General Surgical Service, the Neurological, Urological, Dental, and Plastic Services. The Department of Physical Medicine aids materially in follow-up care and rehabilitation. The House Staff of the Fracture Clinic consists of the Chief Resident assigned from the Orthopedic Service, the Fracture Resident from the General Surgical Service, two Assistant Residents from the Orthopedic Service, and an Intern assigned from the General Surgical Service. The period of assignment of the Surgical Fracture Resident is for four months, and of the Intern for six weeks. By this system, members of the General Surgical Service are rotated through the Fracture Clinic as a routine procedure.

Patients in whom the major damage is to bone are admitted to White 5, and those who present difficulty with abdominal, chest, or other soft tissue are cared for on the other divisions of the Surgical Service. Head injuries are the responsibility of the Neurosurgical Service. When a patient presents a combination of injuries, his care is directed by representatives of the appropriate services in cooperation with one another.

The ultimate goal in caring for any traumatized patient is to restore the individual to normal functional and economic activity. These purposes are accomplished by: 1) early and adequate care of the injured, to preserve life and limb, 2) stabilization of the broken bone, 3) preservation and/or restoration of soft tissue, 4) rehabilitation of the injured part and the patient as a whole. Most fractures will heal satisfactorily if "set" and held sufficiently long with external splinting; but if open operation is necessary we can procede with confidence, because notable advances have been made in the operative management of fractures, due considerably to experience gained in two World Wars. These improvements are the result of better training of fracture surgeons, the standardization and manufacture of metals which are inert in human tissue, the production of antibiotic drugs, and the extensive use of whole blood, plasma, and other supporting agents which make permissible extensive surgical procedures not possible a few years ago.

Vitallium, an aluminum alloy, and certain grades of stainless steel in the form of nails, plates, screws, wires, and bands have for several years been used for stabilizing broken bone. Since World War II, however, many long bone fractures have been treated by the introduction of a long steel rod into the medullary canal of the bone. This form of treatment has allowed earlier return of function of the injured extremity and has diminished the long periods of hospitalization required for traction and other "conservative" forms of treatment.

Many of the modern methods of handling fractures could not have been accomplished without proper anesthesia, and to our Department of Anesthesia the Fracture Clinic of the M.G.H. owes much, particularly for its use of "regional anesthesia" or nerve blocks for management of fractures of the extremities. Over one thousand "Brachial Block" anesthesias have been used in the upper extremities at M.G.H. since 1945.

The Fracture Clinic is indebted to its patients, not only in the General Hospital wards but in the Baker Memorial as well, because by our treatment of these patients we not only benefit them but also we, ourselves, learn the best methods to be employed. The Follow-Up Clinic, where all patients are seen at the end of one year or longer, is one of the unique and very important functions of the Fracture Clinic. Were it not for the cooperation from our patients, such a Follow-Up Clinic would not be possible. The Postgraduate Course in "The management of fractures and other traumatic conditions", based upon our follow-up studies, first offered in 1928 and now in its 27th year, has been given without interruption every year since World War II. During these many years the Course has been attended by 1,305 students from every State in the Union and ten foreign countries. Many surgeons have taken the Course two or more times, and we have a loyal group of "alumni" scattered throughout the world.

Our teaching of postgraduate and undergraduate students and the administration of the Fracture Clinic are financed by money we earn by teaching in the annual Postgraduate Course. Such money is spent on secretarial help and for work done by the Art and Photography Departments. This method of financing the Clinic is possible because all instructors give their services without charge. Not one has ever been paid by the Medical School or the Hospital. No instructor retires from teaching in the Postgraduate Course because of the age limit which terminates the services of surgeons from their regular Hospital duties. Dr. Smith-Petersen taught for six years after his retirement in 1947; and Drs. Henry Marble, William Rogers, and George Van Gorder, although no longer on the active Staff, still continue to give their lectures in the Postgraduate Courses. Dr. Armin Klein did the same until his untimely death in 1954.

While our Fracture Ward is adequate and our instruments are of the best, the Out-Patient section of the Fracture Clinic desperately needs new quarters nearer the X-ray Department and the Emergency Ward. If such a move is not possible, we should at least have an X-ray unit in close proximity to the Clinic. At present we are located just about as far from these facilities as the physical set-up of the Hospital allows. This works a great hardship upon nurses and doctors, and upon patients—many of whom are litter cases or are on crutches. It is hoped that with some of the new buildings under construction, space can be found to accommodate a new "Fracture Unit", where the Out-Patient services can be combined with X-ray facility and Emergency Ward care.

The Out-Patient Fracture Clinic meets on Tuesday and Friday mornings. It is directed by a head nurse, Mrs. Ruth Lowell, and her assistant student nurses. The Fracture Clinic secretary, Miss Marion Melnick, ably assisted by Miss Katherine Sipple, record examinations of patients dictated by the Visiting and House Staffs. The Clinic could not function effectively without the help of our loyal volunteer secretary, Miss Ruth Clark, who has been in regular attendance for the past three years. The always faithful Mr. John McCracken renders valuable aid, not only in the Out-Patient Clinic, but on White 5 as well.

Fracture Rounds are held every Friday from 8 to 10 A.M., beginning with Ward Rounds and terminating with review of all Emergency Ward and follow-up cases seen during the previous week.

A new and important undertaking by members of the Fracture Clinic during the next few months will be the publication of a textbook on *The management of fractures and other traumatic conditions.* Our previous book, published in 1938 under the editorship of Dr. Philip D. Wilson, has been out of date for many years. Contributions to the new publication will be by more than thirty authors, all of whom have profound knowledge of the subjects about which they will write. While it is necessary that the book have an editor and an editorial board, the responsibility of the publication will be shared by all members of the Clinic, from many services of the Hospital. This will be entirely an MGH effort, written by members of the MGH Staff and illustrated by members of the MGH Art Department, headed by Mrs. Muriel Miller, and the Photography Department, directed by Mr. Donald Withee.

We believe that the management of patients with fractures and other injuries at the M.G.H. is fairly close to the ideal at the present time. The segregation of such cases into a separate Clinic has been accomplished with great benefit to the patients and with a minimum amount of friction between the General surgeon, the Orthopedic surgeon, and representatives from other divisions of the Surgical Service. Many civilian hospitals in our country have been reluctant to establish such clinics because of disagreement between staff members. Such has not been the case at M.G.H. Our arrangement is quite comparable to that used in Armed Service hospitals, where a division of bone and joint surgery is part of the General Surgical Service. Such an arrangement expedites the care of patients and promotes harmony between staff members, many of whom may be involved in caring for the same group of patients over a long period of time.

Edwin F. Cave, M.D.,
Head of Fracture Clinic

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. Again this month, and despite the fact that this request has been made in each issue of THE NEWS for nearly five years—ever since we started this column—not every author remembered to include that information. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

General Surgery

Huggins, C., Jr., and Taylor, G. W.
Carcinoma of the male breast.
A.M.A. Arch. Surg. 70:303-308.

Gynecology and Obstetrics

Liu, W.
Vaginal cytology in cancer patients treated by radical hysterectomy.
Am. J. Obst. & Gynec. 69:299-311.

Liu, W., and Meigs, J. V.
Radical hysterectomy and pelvic lymphadenectomy: A review of 473 cases including 244 for primary invasive carcinoma of the cervix.
Am. J. Obst. & Gynec. 69:1-32.

Stone, B. H., and Mansell, H.
Procidentia and cervical cancer.
Obst. & Gynec. 5:198-200.

Laboratory Science

Gergely, J., Gouvea, M. A., and Karibian, D.
Fragmentation of myosin by chymotrypsin.
J. Biol. Chem. 212:165-177.

Laurent, T. C., and Gergely, J.
Light scattering studies on hyaluronic acid.
J. Biol. Chem. 212:325-333.

Pathology

Dudley, H. R., Ritchie, A. C., Schilling, A., and Baker, W. H.
Pathologic changes associated with the use of sodium ethylene diamine tetra-acetate in the treatment of hypercalcemia: Report of two cases with autopsy findings.
New England J. Med. 252:331-337.

Books

White, J. C., and Sweet, W. H.
Pain: Its mechanisms and neurosurgical control.
Springfield, Ill., Charles C. Thomas.

ALOHA

One of the unique surgical societies of the world is the Pan-Pacific Surgical Association, for it always holds its meetings in the Hawaiian Islands—the Paradise of the Pacific. Any surgeon who lives in any country that borders on the Pacific Ocean may become a member for a very small fee. The scope of such an organization is, of course, tremendous when one considers the vast size of the Pacific and all the countries which border on it. Even we who live in Boston, looking out upon the Atlantic, are welcomed as members, and this year the Association honored one of our Massachusetts General Hospital senior surgeons, Dr. Arthur W. Allen, by electing him the new President of the Association at its Sixth Congress in Honolulu, on October 14, 1954. Dr. Allen has had many such honors conferred upon him, but I am sure this is a most welcome one and a challenge to him, especially since the Association is in need of new members—and what better man could they have chosen?

The Sixth Congress was held from October 7 to 15. The meetings were well attended by famous surgeons from many countries. Drs. Arthur W. Allen, William H. Sweet, and I represented the Massachusetts General Hospital at the Congress. The sessions were arranged admirably, starting with breakfast and panel discussions of various surgical topics at the Queen's Surf on famous Waikiki beach at 7:30 A.M. They carried on through until noon, when they were adjourned until the following morning. This left the afternoons free for us to see something of the Hawaiian Islands. Our evenings were spent with many of our gracious hosts—the doctors of the islands—at their various homes.

It is impossible in a short space to describe what a wonderful time was enjoyed by everyone, and to give the names of all those on the islands who made our stay such a pleasant and profitable one. We arrived by boat and air, and from the moment we set foot on the islands it was an exciting and stimulating experience. Dr. Lester Yee, West Surgical 1941, and his new bride greeted us as we stepped off the Pan American Stratocruiser at Honolulu. We were showered with beautiful leis and other things that go with them. It was also of interest and pleasure to have one of my former patients, on whom I had performed a splenorenal shunt, greet us at the air terminal and to see how well he looked.

In addition to taking part in the panel discussions, Dr. Allen presented a paper on "Cancer of the colon", Dr. Sweet presented a paper on "The uses of nuclear disintegration in the diagnosis and treatment of brain tumors", and I presented one on "The results obtained in the treatment of 120 patients with bleeding esophageal varices by portacaval shunts".

Before leaving the islands we were royally entertained by Dr. Samuel Yee (*H.M.S.* 1934), to celebrate the election of Dr. Allen as our new President. We had dinner at the most beautiful Chinese restaurant in the world—Lau Yee Chai, at Waikiki. A photograph taken at the banquet and reproduced on the last page of this issue of THE NEWS, shows Dr. and Mrs. Arthur W. Allen, Dr. and Mrs. Stanley Garber of Cincinnati, Dr. and Mrs. Harold L. Foss of Danville, Pennsylvania, Dr. and Mrs. Randolph Lovelace of Albuquerque, Dr. and Mrs. Robert R. Linton, and our hosts—Dr. and Mrs. Samuel Yee of Honolulu.

It is hoped, with this short introduction to the Pan-Pacific Surgical Association, that more of our Staff and Alumni will avail themselves of the opportunity of joining the Association. Needless to say, one will never regret a trip to the Paradise of the Pacific—even for a surgical meeting.

Robert R. Linton, M.D.,
Visiting Surgeon

New addresses:—

Dr. Craig S. Lichtenwalner (*M.* 1950), 11 Maple Ave., Newton 58, Mass.

Dr. Walter T. St. Goar (*M.* 1950), Department of Medicine, Queen Elizabeth Hospital, Birmingham, England

Dr. Boris Senior (*C.M.* 1950), 3 Third Ave., Lower Houghton, Johannesburg, South Africa

Brief bits:—

Dr. Benjamin Castleman was invited to conduct a Clinicopathological Conference at the American College of Physicians' meeting in Philadelphia on April 26.

Dr. Edward D. Churchill received a certificate of appreciation on March 17 from the Walter Reed Army Medical Center, Washington, D.C., "in recognition of outstanding contributions for the improvement of knowledge and surgical practice of importance to national defense and for the presentation of the third William L. Keller Lecture on the subject 'Gunshot wounds' ".

Dr. James A. Halsted (*W.M.* 1932) is returning to the East, after spending five years at the Veterans Administration Center in Los Angeles. He has been appointed Chief of Professional Services at the Veterans Hospital in Syracuse, N. Y., and a member of the Department of Medicine of the faculty of the State University of New York, Syracuse Medical Center.

Dr. John W. Irwin addressed the members of the American Otological Society, Inc., at their annual meeting in Hollywood, Florida, on March 18. His topic was "Small blood vessels during allergic reactions".

Dr. William P. J. Peete (*S.* 1948) of Warrenton, North Carolina, is doing chest surgery at a hospital in Stockholm, Sweden, by courtesy of a Moseley Scholarship.

Dr. James M. Shannon (*S.* 1948) is now associated with Dr. Walter G. Phippen (*S.S.* 1906) in the practice of surgery. Their office address is 31 Chestnut Street, Salem, Massachusetts.

Dr. and Mrs. George Gilbert Smith flew to Athens, Greece, on April 4, to attend the meeting of the Société International d' Urologie. Dr. Smith has been president of the society since 1947. They spent a few days at Lisbon, Rome, and Istanbul *en route*, and returned on May 1.

Dr. Howard B. Sprague delivered the third C. C. Birchard Memorial Lecture before the Montreal Medico-Chirurgical Society on April 1. His subject was "Clinical types of atrial fibrillation and their management".

Dr. Ellsworth H. Trowbridge, Jr. (a.r.p. *N.* 1940) announces the association of Dr. John D. DeMott in the practice of Psychiatry, Neurology, and Electroencephalography. Their office and E.E.G. laboratory are at 1405 Bryant Building, 1102 Grand Avenue, Kansas City 6, Missouri.

Dr. James C. White gave the first Albert Kuntz Lecture at Saint Louis University School of Medicine on March 23. These lectures are to be given annually in honor of Dr. Albert Kuntz, Professor of Anatomy. Dr. White's subject was "The role of the autonomic nervous system in chronic persistent pain".

Dr. Kazuo K. Kimura, Intern in Children's Medicine—born in Sheridan, Wyoming, September 16, 1920; University of Washington, Seattle, 1938-42; B.S. in Pharmacy, University of Washington, 1942; M.Sc. in Pharmacology and Physiology, University of Nebraska, 1944; Instructor in Pharmacology and Physiology, University of Nebraska, 1944-45; Research Fellow in Pharmacology, University of Illinois College of Medicine, 1945-49; Ph.D. in Pharmacology and Physiology, University of Illinois, 1949; Instructor in Pharmacology, St. Louis University School of Medicine, 1949-53; two years of medical school, University of Illinois; M.D., St. Louis University School of Medicine, 1953; Assistant Professor of Pharmacology, St. Louis University School of Medicine, 1953-54.

Dr. Arthur R. Kravitz, Intern in Medicine—born in Brooklyn, N. Y., November 10, 1928;

Dinner party at Waikiki—celebrating the election of Dr. Arthur W. Allen as President of the Pan-Pacific Surgical Association

Left to right: Mrs. Stanley Garber, Dr. Samuel Yee (*H.M.S.* 1934), Mrs. Arthur W. Allen, Dr. Stanley Garber (*H.M.S.* 1934), Dr. Robert R. Linton, Mrs. Randolph Lovelace, Mrs. Harold L. Foss, Dr. Harold L. Foss, Mrs. Robert R. Linton, Dr. Arthur W. Allen, Mrs. Samuel Yee, Dr. Randolph Lovelace (*H.M.S.* 1934)

A.B., Harvard College, 1950; M.D., Harvard Medical School, 1954; married.

Dr. Alfred J. Luessenhop, Assistant Resident in Neurosurgery—born in Chicago, Illinois, February 6, 1926; Yale University, 1943-44; U.S. Army: Pfc, Medical Corps, in general hospitals in France, 1944-46; Yale University, 1946-48; B.S., Yale University, 1949; M.D., Harvard Medical School, 1952: Intern in Surgery, University of Chicago Clinics, 1952-53; Research Fellow in Surgery at Harvard Medical School and Clinical and Research Fellow in Neurosurgery at Massachusetts General Hospital, 1953-54.

Dr. Donald B. Martin, Intern in Medicine—born in Philadelphia, Pennsylvania, July 24, 1927; U.S. Navy: Seaman 1st Class, 1945-46; A.B., Haverford College, 1950; M.D., Harvard Medical School, 1954; home: Ardmore, Pennsylvania.

Dr. Jule P. Miller, Jr., Assistant Resident in Psychiatry—born in St. Louis, Missouri, March 14, 1926; U.S. Navy: Electronic Technician, 1944-46; A.B., Washington University, St. Louis, 1949; M.D., Washington University College of Medicine, 1953; Intern on Ward Medicine, Barnes Hospital, St. Louis, 1953-54; married; home: St. Louis.

Dr. David B. Murray, Assistant Resident in Pathology—born in Darlington, County Durham, England, 1926; Oundle School, 1940-44; B.A. honours, 1947, M.A., 1951, and M.B., Ch.B., 1951, Cambridge University, England; Intern, Hospitals of East Suffolk, Ipswich, 1951, and Pembury, Kent, 1952; Junior Clinical Resident Pathologist, Guy's Hospital, London, 1952; Resident in Anatomic Pathology, General Hospital, St. John's, Newfoundland, 1953-54; Royal Canadian Air Force: Flight Lieutenant, Medical Auxiliary Unit, St. John's, 1953-54; married.

Dr. Barbara M. Orski, Intern in Children's Medicine—born in Warsaw, Poland, October 1, 1929; A.B., Hunter College, New York City, 1949; M.D., Harvard Medical School, 1953; Intern in Medicine, Peter Bent Brigham Hospital, 1953-54.

Dr. Demetrios A. Papadopoulos, Assistant Resident in Urology—born in Thessaloniki, Greece, June 8, 1924; M.D., Medical School of the University of Thessaloniki, 1951, following three years of service in the Medical Corps of the Greek Army; Assistant Resident in General Surgery, Laikon Hospital, Thessaloniki, 1951; Assistant Physician, Soldiers Home, Chelsea, Massachusetts, 1952; Assistant Resident in Urology, New England Center Hospital, Boston, 1953; home address: 4 Dragoumi Street, Thessaloniki, Greece.

* * *

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

The Annual Picnic Supper for the house staff and visitors from other countries and their families will be held at the Bradford Cannons' in Lincoln on May 21, at 3 P.M. Each family is to bring its own supper and drinks. Dessert will be provided.

For those traveling out in their own cars, here are the directions: Take Route 2 out of Cambridge as far as the traffic light at the top of the hill in Lincoln. You will see a Socony Gas Station on the corner. Turn left to Lincoln Center, and then take the Weston Road on the left from Lincoln Center to the Cannons' driveway, which is on the left side of the road. You will see the sign "CANNON". It takes approximately 3/4 of an hour from Boston.

For those who have no transportation—this can be arranged for you. Be sure to let us know about this.

Also, BE SURE TO COME.

At the last tea which the Staff Wives gave for the staff and visiting doctors and their wives, we were pleased to note that 21 Staff Wives served as hostesses. There were 34 MGH doctors and their wives present, and at least 35 foreign guests. There were also two darling babies who were brought with their parents.

We are most grateful to Mrs. Greene FitzHugh for the beautiful flowers, which were arranged by Mrs. Samuel Morrill.

Mrs. Chester N. Frazier was most gracious in serving the sandwiches at all three teas this year—sandwiches which she had competently prepared.

Our thanks go to Mrs. Soma Weiss for making all the arrangements for our teas, and to Miss Louise Hatch for attending to the details each time.

These teas have been thoroughly enjoyed by all of us.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 146 Boston, Mass. June 1955

RETROLENTAL FIBROPLASIA

Part of the story of retrolental fibroplasia is past history, which tells of the slow accumulation of knowledge of the nature of the disease and the numerous efforts to discover its cause. The rest of the story is a statement of the present concept of retrolental fibroplasia and the present status of knowledge of its causation.

In 1942, Dr. Theodore L. Terry of the Massachusetts Eye and Ear Infirmary published the first report of retrolental fibroplasia, as an ocular disturbance found in premature infants of low birth weight, which resulted in partial or complete blindness. The chief features of Dr. Terry's description are: a vascularized grayish-white membrane behind each crystalline lens, microphthalmia, shallow anterior chamber, thin, elongated ciliary processes, fetal-blue color of the iris, searching nystagmus, and photophobia.

At the time of its discovery, and for the next few years, retrolental fibroplasia was relatively rare and little known. During the past decade, however, the number of cases has increased so markedly (while other causes of infant blindness have in large part been eliminated) that retrolental fibroplasia is now the most common cause of blindness in children.

Although the early reports were confined, for the most part, to a few regions in the United States (Massachusetts, New York, Illinois), in the last 5 or 6 years retrolental fibroplasia has appeared in parts of this country and in many other parts of the world where, in spite of systematic searching, it had not previously been found. And the manner of its spreading was puzzling. The locus of its appearance was sometimes a specific hospital, rather than a city or a region. There were many instances of its presence in one or a few hospitals in a city, and not in others. The hospitals in which it occurred were not invariably the large institutions where many patients are seen. In fact, in some cities, the large hospitals were relatively free of the disease, while cases were found in the smaller hospitals. In certain regions where it had been well established, it abated both quantitatively and qualitatively, so that cases became fewer and less severe, for no apparent reason. In some hospitals, the incidence showed wide fluctuations from year to year.

Past research

Interest in the cause of this disease has naturally grown with the alarming increase in its frequency and distribution, and numerous possible causes have been investigated. (Many of the etiologic factors studied by others were originally suggested by Dr. Terry, who was in the process of investigating their validity at the time of his death in 1946.)

Some research groups have sought the answer in factors relating to the parents. The various causes of prematurity (for example—multiple births, toxemia of pregnancy, premature separation of the placenta, placenta previa, premature rupture of the membranes) have been investigated. It is the conclusion of numerous authors that *prematurity itself,* and not the cause of prematurity, is a significant factor in the etiology of retrolental fibroplasia.

Investigators have failed to find a correlation between retrolental fibroplasia and maternal disease during or before pregnancy. Nor has an association with retrolental fibroplasia been found in any aspect of the mother's obstetrical history or treatment.

Other workers have directed their attention to factors relating to the infant. No association has been found between retrolental fibroplasia and the following: the season of birth, multiple birth, sex distribution, congenital anomalies, and the condition of the infant at birth.

It has been possible to rule out certain aspects of pediatric management, since it was demonstrated that the disease is not caused by the premature exposure of the retina to light, nor by the water-miscible vitamin preparations which have been in use during the past ten years, nor by a deficiency of vitamin E. It has been shown that weekly transfusions of blood from women in their last trimester of pregnancy will not protect premature infants from retrolental fibroplasia. And it has also been demonstrated that ACTH and cortisone have no effect on the course of the disease. (It should be mentioned that, in the experiments made with vitamin E and with ACTH and cortisone, the results at first looked very promising. However, when controlled experiments on sufficiently large groups of babies were done, it became evident that these agents were ineffective in either curing or preventing retrolental fibroplasia.)

The nature of retrolental fibroplasia

Although little progress was made during this period toward discovering the *cause* of retrolental fibroplasia, much was learned concerning its nature and clinical course. Before 1949, the disease was recognized only in its final stages when the retrolental membrane was a *fait accompli.* In 1949, however, ophthalmologists and pediatricians started to make routine regular eye examinations, from birth on, of all premature babies of low birth weight. From these repeated examinations they were able to see the disease start (usually between 3 and 6 weeks after birth) and then advance, stage by stage, to the completion of its active or acute phase (in 3 to 5 months). It was observed that the clinical course of the acute phase of retrolental fibroplasia includes retinal-vessel dilatation and tortuosity, vitreous clouding, retinal clouding, hemorrhage into the retina and vitreous, growth of new capillaries, progressive retinal detachment, and retinal membrane formation.

Mild and severe forms of retrolental fibroplasia

It was also observed that retrolental fibroplasia does not always run its full course to retrolental membrane formation (with resulting partial or complete blindness). In fact, in a large percentage of cases (about 60%), it subsides spontaneously during the early stages. When this regression occurs, the disease is designated as *mild;* in many instances, the affected eye appears to become entirely normal.

Our group, working at the Massachusetts Eye and Ear Infirmary, is investigating the possibility suggested by Dr. Merrill J. King that, even when regression appears to be complete, the visual function is often somewhat impaired. We have found, at preschool or school age, seriously defective vision in prematurely-born children who, as infants, showed signs of only the earliest stages of retrolental fibroplasia. On the other hand, children who, in infancy, showed the severe form of retrolental fibroplasia and for whom the most pessimistic prognosis was made, have sometimes been found to have a considerable amount of useful vision, when examined at nursery school or school age.

For this reason, our group is now engaged in a new, long-term study to evaluate the degree of visual damage which results from each stage of retrolental fibroplasia, mild or severe, whether regression has occurred or not. Formerly, if no evidence of retrolental fibroplasia was observed, babies were discharged from our study at the age of 3 months. If retrolental fibroplasia was present, examinations were continued for at least 5 months and often for a year. In the present study, we will continue to examine the children until they are 5 years old, since we feel it is not until then that it is possible to make a reliable estimate of their vision. In addition, we are now recalling the discharged members of the previous study, for visual testing, with the same idea in mind. We have complete records of the ophthalmoscopic examinations of all infants of birth weight 4 pounds or less, born at the Boston Lying-in Hospital since 1949, and will attempt to correlate any visual defect we find at the age of 5 years with what we know of the condition of the child's eyes in early infancy. Such information may aid in understanding and caring for the visual defects which are sometimes found in children of premature birth, and which may have been caused by mild forms of retrolental fibroplasia.

Pathology

Since retrolental fibroplasia is a disease which usually does not impair the general well-being of the infant, and since it is now seldom confused with diseases for which enucleation is indicated, the opportunities for examination of microscopic sections of eyes in the acute phase of retrolental fibroplasia have not been numerous. Nevertheless, enough pathologic material has been accumulated to establish the pathologic morphology of the disease. It has been found that retrolental fibroplasia is essentially a disturbance of the *developing* blood vessels of the retina, with abnormal growth of new capillaries. The subsequent complications of retinal detachment and retrolental membrane formation are evidently secondary to this initial effect on the developing blood vessels.

Present concept

The present knowledge of the clinical course and pathology of retrolental fibroplasia, of the possibility of spontaneous regression during its early stages, and of the existence of mild as well as severe forms, have made it necessary to revise the original concept of the disease. It is now regarded essentially as a disorder of the developing retinal blood vessels. It is also agreed that the presence of a retrolental mass is by no means the only indication that the acute phase of the disease has previously existed. All gradations of severity, from very slight damage to complete membranes, may be found, and the degree of damage depends upon the extent of involvement during the acute phase. In some cases the only findings are minute retinal folds or scarring which give almost no clinical signs. Other cases may show myopia. Visual defects (resulting from such residua as retinal pigment disturbance, optic atrophy, and dragged disc) may be found.

Most observers agree that the disease is bilateral, although there may be a difference in involvement in the two eyes.

Present knowledge of the causation of retrolental fibroplasia

Many investigators reasoned that, since retrolental fibroplasia has been increasingly evident during the past ten years, its cause might be found in some aspect of premature-infant care which had been introduced or more extensively used during that same period of time. One such form of treatment is, of course, oxygen therapy. Premature infants are predisposed to respiratory difficulties because their lungs are not fully developed at birth, and these infants often require additional oxygen in the air they breathe. Because pediatricians have felt that many very small premature babies have been kept alive by this treatment, oxygen therapy has become an almost universal practice in the last ten or fifteen years, in modern, well-staffed nurseries for premature babies.

Early in its use, oxygen was administered simply by means of a funnel or tent, so that it quickly became diluted by the room air, and the atmosphere breathed by the baby did not contain high concentrations of oxygen. However, in recent years, more efficient equipment for oxygen administration has been developed, in the form of closed incubators into which oxygen can be introduced and fairly well maintained at any desired concentration. It has therefore been the tendency, in recent years, to rear premature infants *routinely* in high concentrations of oxygen.

One of the earliest observations of a possible association between oxygen therapy and retrolental fibroplasia was made in 1949 by the group at the Massachusetts Eye and Ear Infirmary. It was found, on examining the hospital records of all the premature infants (of birth weight 4 pounds or less) born at the Boston Lying-in Hospital from 1938 to 1948, that the infants in whom retrolental fibroplasia subsequently developed remained in the premature nursery, the incubator, and in oxygen for longer periods of time than the infants in whom retrolental fibroplasia did not develop.

Following this, groups in Australia and in England reported: (1) that cases of retrolental fibroplasia had not occurred in their hospitals when oxygen was administered infrequently and simply, by means of tent or funnel, (2) that the disease started to appear only after efficient oxygen incubators had been put into use and oxygen was given routinely and liberally to all premature infants of low birth weight, (3) that when the use of oxygen therapy was restricted to those babies who showed definite clinical need for it, no further cases of retrolental fibroplasia appeared, and (4) that when they compared the rate of occurrence of retrolental fibroplasia from hospital to hospital, they found a higher incidence of retrolental fibroplasia in hospitals which used oxygen therapy liberally than in hospitals which used it sparingly.

Although such reports were interesting and suggestive, they were by no means conclusive, for several reasons. In the first place, the experiences being compared were not necessarily comparable. For example, comparison was made between the results of high oxygen therapy in one hospital and the results of low oxygen therapy in *another* hospital, and the difference in oxygen policy may have been only one of *many* differences between the two hospitals. Again, comparisons were made between events which occurred in different time periods, and there is no way of knowing whether some unknown causal factor existed during one period and not in the other. Finally, the reported changes in incidence of retrolental fibroplasia following changes in oxygen administration occurred over rather short periods of time (1-2 years). Those of us who have been observing the incidence rate of retrolental fibroplasia over a period of 15 years have seen wide fluctuations in incidence from year to year, for no accountable reason. Nevertheless, if these reports were not conclusive, they were at least highly suggestive that there might be a connection between high oxygen treatment and retrolental fibroplasia.

Therefore, a more precise kind of study was undertaken by Dr. Arnall Patz and his group, in Washington, D.C., to investigate this possible connection. This was a so-called controlled study in which the group of premature babies of birth weight 3 pounds 5 ounces or less, in one premature nursery (Gallinger Hospital), were divided into two subgroups. One subgroup received high concentrations of oxygen (80%) for long periods of time (28 days) and the other subgroup received low concentrations of oxygen (less than 40%) only when clearly needed, and then for only very short periods of time. In all other respects, identical pediatric care was given to both subgroups of infants. In the first subgroup (high oxygen), 25% of the infants developed severe retrolental fibroplasia and 36% more developed mild retrolental fibroplasia. In the second subgroup (low oxygen), no infants developed the severe disease, and 16% developed mild retrolental fibroplasia. It is clear that these results strongly suggest that high oxygen therapy is an important factor in the causation of retrolental fibroplasia.

It is important to point out that in this study, and in others like it, which were designed to investigate the possible relation of high oxygen therapy to retrolental fibroplasia, there was no danger of producing more cases of retrolental fibroplasia than would otherwise have occurred. Since high oxygen therapy was part of the universal *routine* method of premature-infant care, the infants who received high oxygen therapy were not being exposed to any more hazard than that facing any premature infant being reared, at the time, in any modern well-equipped premature nursery. It was, rather, the babies in the low oxygen group whose treatment was, in a sense, experimental, since restricted oxygen therapy was a departure from routine. However, pediatricians were beginning to suspect that there were fewer indications of need for oxygen therapy than was previously believed, and that, even when there was a definite need, lower concentrations of oxygen would probably suffice. And, indeed, it was found that the mortality rate in the low oxygen group was no greater than in the high oxygen group.

(It should be pointed out that it is not always possible to avoid the use of high concentrations of oxygen, since some infants require it for survival. The babies in the low oxygen group were, of course, carefully watched and those who gave indication of needing more oxygen received it, but were no longer considered members of the low oxygen group.)

Several other groups of investigators have made similar studies in their own hospitals and have obtained similar, confirming results, both as to the association of high oxygen therapy with retrolental fibroplasia, and the survival rate of premature infants in low oxygen.

These reports were all highly suggestive of a causal relationship between high oxygen therapy and retrolental fibroplasia, although each study dealt with relatively small numbers of babies. This was necessarily so because no one premature nursery has a very large group of infants of low birth weight. In order to accumulate data on a *large* number of premature infants, a Coordinated Study was planned and started, about a year and a half ago, in 18 hospitals throughout the country, by Dr. V. Everett Kinsey (formerly of the Howe Laboratory at the Massachusetts Eye and Ear Infirmary, and now of the Kresge Institute in Detroit). This study was designed to investigate the oxygen question in much the same way as had been done by Dr. Patz, but on a much larger scale. In the Coordinated Study, to be sure, many different hospitals were involved, but both high and low oxygen treatment was given in *each* hospital, and every effort was made to keep other conditions uniform in all 18 hospitals. Moreover, the studies were all going on simultaneously. The results of this large study showed that the incidence of severe retrolental fibroplasia was markedly higher in the group of infants receiving large amounts (so-called routine) of oxygen treatment than in the group which received very little (curtailed) oxygen treatment.

Since, in all of these studies, it has been demonstrated that many premature infants may be reared successfully with very little or no oxygen therapy, it is now felt that it can be safely recommended that the use of oxygen therapy be rigidly restricted to infants who show a definite clinical need for it and no longer be used as a routine treatment for premature babies. These recommendations are being widely publicized in editorials in medical and, particularly, pediatric journals, and in statements by numerous State health departments and governmental health agencies.

However, although it has been shown repeatedly that in most cases oxygen treatment for premature infants can safely be restricted, there are, and possibly always will be, some babies who require high oxygen treatment for survival, and who will therefore be exposed to its dangers as well as its benefits. This is perhaps less alarming than it sounds because there are indications, from the results of the Coordinated Study and some of the smaller studies, that it is possible to work out the safe limits of both amount and duration of oxygen therapy which will satisfy the infants' needs for oxygen and yet not expose them to the danger of retrolental fibroplasia. Also, there may well be certain methods of protection against the damaging effects of oxygen, when large amounts are required. It is hoped and expected, therefore, that in good medical hands, with the information that is constantly being collected, oxygen therapy can safely be used when needed.

Animal experiments

In establishing the relationship of a human disease to a possible causal factor, it is useful to be able to produce the disease in animals, by means of that factor. Such experiments with animals have been done by three separate groups of workers, in England, in Sweden, and in this country. Eye damage which very closely resembles human *mild* retrolental fibroplasia has been produced in the eyes of newborn animals (kittens, puppies, mice, and rats) by exposing these newborn animals to continuous high oxygen treatment. This is very convincing additional evidence that oxygen is an important factor in the causation of retrolental fibroplasia, although it is a little puzzling that these eye changes, for the most part, resemble *mild* retrolental fibroplasia, and almost no cases of *severe* retrolental fibroplasia (with retinal detachment and membrane formation) have been produced in animals this way.

All things considered, it seems clear that the research of these past few years has made real progress in an attack on the disease which is, at present, the major cause of infant blindness. The matter, however, is not entirely solved, and there remain some problems which require further investigation. For example, while it is true that many fewer cases of severe retrolental fibroplasia occur in the low oxygen groups, there are still some. In fact, there are even a few instances of severe retrolental fibroplasia in babies who have received *no* oxygen therapy at all. Furthermore, in the experience of many groups, cases of *mild* retrolental fibroplasia still continue to occur in considerable numbers, even when oxygen therapy is greatly reduced.

Moreover, the experience of our group (working with the infants of birth weight 4 pounds or less born at the Boston Lying-in Hospital) has been distinctly different from the experience of those groups who have reported that a reduction in incidence of retrolental fibroplasia followed restriction of oxygen therapy. We have not, in fact, found that the incidence rate of retrolental fibroplasia parallels the extent of oxygen therapy. Our study shows that at the Boston Lying-in Hospital there were wide fluctuations in incidence rate of severe retrolental fibroplasia between the years 1938 and 1948, with peaks in 1945 and 1948 of 32% and 27%, respectively. In 1949, the incidence rate of *severe* cases fell abruptly to less than 10% and has remained at this low level to the present time, in spite of the fact that the most extensive use of oxygen therapy at the Boston Lying-in Hospital occurred in 1949 and 1950. On the other hand, the curtailment of oxygen therapy, instituted in 1951, produced no further drop in the incidence rate of *severe* retrolental fibroplasia, and no change in the high incidence rate (40%) of *mild* cases. It is possible that the reduction in oxygen therapy was greater in those hospitals which reported a fall in incidence rate following restriction of oxygen therapy than at the Boston Lying-in Hospital.

Because of the problems which remain to be solved, many investigators feel that although it has been demonstrated that oxygen therapy is perhaps a major factor in the causation of retrolental fibroplasia, there may well be other factors, as yet unrecognized. Does excessive oxygen therapy actually cause the *mild* disease, as it does in animals, or does it produce *severe* disease by aggravating already existing mild cases which are the result of some other cause? Is it possible that any one of a number of ailments to which premature infants are susceptible, which perhaps *themselves* create a need for oxygen therapy, might give rise to the mild disease?

In spite of these unanswered questions, it is generally agreed that the evidence is good that high oxygen therapy is an important, if not the only, factor in the causation of retrolental fibroplasia. This knowledge, combined with the assurance that for many babies oxygen therapy can safely be reduced or even omitted, should result, within the next few years, in a striking reduction in the number of our preschool blind.

Leona Zacharias, Ph.D.,
Fellow in Ophthalmology

Resolution adopted by the Trustees at their meeting on May 13, 1955, on the death of John R. Macomber

We record with profound sorrow the death on May 11, 1955 of our fellow trustee John R. Macomber.

First elected to the Board in 1919, he served as trustee until 1932, when he resigned to take up business in New York. Returning to Boston in 1934, he was re-elected a trustee and in 1944 became President of the Corporation, serving in these capacities until his death.

Beloved by trustees, staff, and members of the Corporation—his keen mind and sound judgment commanded universal respect, and his warm and friendly personality endeared him to all. As a member for many years of the General Hospital Committee and the Committee on Finance, he gave full measure in both time and interest, but his devotion to the Hospital throughout the span of his service took form in many other ways. As a lover of animals, he was keenly interested in the arrangements for the care of the animal farm in the new Research Building. Always he kept a watchful eye on the trees, shrubs, and flowers on the Bulfinch lawn, and it is doubtful if anyone today could tell how many of these were planted under his guiding eye and paid for out of his own pocket. During the last few years he rejoiced in doing over the lawn between the Phillips House and the White Building, as always at his expense, and the yews and the bird bath which add so much to the beauty of that quadrangle were his idea and one of the last of his many generosities to the Hospital.

Nor shall we forget his interest in the Corporation and his delight in being the host at the annual dinner of its members.

Two years ago, under strong pressure from the trustees, he reluctantly agreed to sit for his portrait, and the painting of him and his two dogs now hangs on the Hospital walls. We value greatly this vivid picture of a great servant of the Hospital, while we cherish the memories of service with an associate whose unselfish and farsighted devotion to our beloved institution was an inspiration to us all.

[This Resolution was adopted by a standing vote of the Board.]

* * *

On April 11, at a dinner meeting of the Boston Surgical Society, Dr. Edward D. Churchill was presented with the Henry Jacob Bigelow Medal "for contributions to the advancement of surgery".

Following the presentation, Dr. Churchill gave an address on "The dark decades of Surgery, 1846-1886".

* * *

Dr. and Mrs. Nathaniel W. Faxon flew to Istanbul on May 18. The directors of the American Hospital of Istanbul, Inc., whose headquarters are in New York City, asked Dr. Faxon to go to Turkey in order to make an on-the-spot survey of conditions at the Hospital, to evaluate economic and social relationships between the Turkish government and the medical profession, and to study the problem of the attitude of Turkish women toward nursing.

The Hospital is commonly called the Admiral Bristol Hospital, in tribute to the man who was instrumental in getting the money to build the Hospital while he was our High Commissioner in Turkey after World War I.

The Faxons expect to be in Istanbul about a month.

* * *

The Coordinating Committee of the Massachusetts General Hospital played host to the members of the Committee of Hospital Auxiliaries at their Annual Meeting on April 13, in Bartlett Hall.

Mrs. Oliver Cope, Chairman of the Coordinating Committee, welcomed the members and their guests, who represented fifteen hospitals in the metropolitan Boston area. Mrs. Charles S. Bolster, Chairman of the Committee of Hospital Auxiliaries, presided at the business session which followed morning coffee.

A panel discussion on "The need for cooperation in patient care" was the high light of the morning program. Participating in the discussion were Dr. Oliver Cope, surgeon, Dr. Robert T. Long, psychiatrist, Miss Barbara Sprott, social worker, and Miss Mary Virginia Sellers, nurse.

At the conclusion of the meeting, the guests were conducted on optional tours of the Hospital.

The Board of Trustees, at their meetings on April 15 and 29, voted:

To grant one year's leave of absence to Dr. Bernard D. Briggs, in order that he may accept a Fulbright grant covering a year's lecture appointment at the Christian Medical College at Vellore, South India;

To change the title of Dr. John H. Dwyer from Intern to Second Assistant Resident on the Children's Medical Service, beginning July 1;

To rescind the appointment of Dr. Michael J. Franzblau, Resident in Dermatology, beginning July 1.

To appoint:

Dr. Howard S. Cameron as Assistant Resident in Orthopedic Surgery, beginning October 9;

Dr. Ralph C. Darling, Jr. as Second Assistant Resident in Surgery, beginning January 1, 1956;

Dr. Gerald S. Foster as Assistant in Medicine for one year, beginning July 1;

Dr. Benjamin F. Gill as Assistant in Psychiatry, beginning July 1;

Dr. Joan Kazanjian as Resident on the Children's Medical Service, beginning July 1;

Dr. J. Drennan Lowell as Assistant in Orthopedic Surgery, beginning July 1;

Dr. Walter Mann as Assistant in Psychiatry, beginning July 1;

Dr. Farrokh Saidi as Third Assistant Resident in Surgery, beginning July 1;

Dr. Alfred H. Stanton as Psychiatrist-in-Chief at McLean Hospital, beginning July 1;

Dr. Anne G. Tighe as First Assistant Resident in Pathology for one year, beginning October 1.

At their meetings on April 13, 20, and 27, the General Executive Committee voted:

To promote:

Dr. Benjamin D. Canlas, Jr. from First Assistant Resident to Resident in Pathology for one year, beginning July 1;

Dr. Raymond A. Justi from First Assistant Resident to Resident in Pathology for one year, beginning July 1;

Dr. Walter B. King, Jr. from Third Assistant Resident to Second Assistant Resident in Pathology for one year, beginning July 1;

Dr. David B. Murray from Second Assistant Resident to First Assistant Resident in Pathology for one year, beginning July 1;

Dr. Alexander B. Timm, Jr. from Assistant Resident to Resident in Dermatology for one year, beginning July 1.

To appoint:

Dr. José E. Arreaza as Graduate Student Assistant in Surgery, effective as of April 12;

Dr. Leonard Atkins as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Arthur J. Barker as Clinical Fellow in Surgery, assigned to the Tumor Clinic, beginning July 1;

Dr. Arthur Z. Mutter as Clinical Fellow in Psychiatry, beginning July 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. Again this month, and despite the fact that this request has been made in each issue of THE NEWS ever since we started this column five years ago, not every author remembered to include that information. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Preanesthetic medication. (Guest editorial)
J.A.M.A. 157:242-243.

Lasagna, L., von Felsinger, J. M., and Beecher, H. K.
Drug-induced mood changes in man. 1. Observations on healthy subjects, chronically ill patients, and "postaddicts".
J.A.M.A. 157:1006-1020.

von Felsinger, J. M., Lasagna, L., and Beecher, H. K.
Drug-induced mood changes in man. 2. Personality and reactions to drugs.
J.A.M.A. 157:1113-1119.

Cardiology

Clark, R. J., Tousant, E. S., and Sprague, H. B.
Heart disease in Massachusetts in relation to the Workmen's Compensation Act.
New England J. Med. 252:478-484.

Currens, J. H., McGinty, J. F., Khambatta, R. B., and Gordon, I.
The effect of intravenous protoveratrine on digital pulse volume and digital skin temperature in hypertensive patients.
Circulation 11:440-446.

Dermatology

Herbst, F. S. M., Lever, W. F., Lyons, M. E., and Hurley, N. A.
Effects of heparin on the lipoproteins in hyperlipemia. An electrophoretic study of the serum alpha and beta liproproteins after their separation by fractionation of the plasma proteins or ultracentrifugal flotation.
J. Clin. Investigation 34:581-589.

Endoscopy

Benedict, E. B.
Medical progress: Endoscopy.
New England J. Med. 252:709-719.

Gynecology and Obstetrics

Graham, J. B., and Graham, R. M.
Antibodies elicited by cancer in patients.
Cancer 8: 409-416.

Laboratory Science

Brodie, A. F., and Lipmann, F.
Identification of a gluconolactonase.
J. Biol. Chem. 212:677-685.
Jones, M. E., Spector, L., and Lipmann, F.
Carbamyl phosphate, the carbamyl donor in enzymatic citrulline synthesis.
J. Am. Chem. Soc. 77:819-820.
Lipmann, F.
Coenzyme A and biosynthesis.
Am. Scientist 43:37-47.

Neurology, Neurosurgery, and Psychiatry

Benda, C. E.
The differentiation between mental deficiency and emotional disorders, and some therapeutic experiments with Rauwolfia serpentina (Koglucoid).
Arch. de pediat. d. Uruguay 26:32-46.

Orthopedic Surgery

Lawrence, G. H., Cave, E. F., and O'Connor, H.
Injury to the Achilles tendon: Experience at the Massachusetts General Hospital, 1900-1954.
Am. J. Surg. 89:795-802.

Otolaryngology

Kelemen, G.
Experimental defects in the ear and the upper airways induced by radiation.
A.M.A. Arch. Otolaryng. 61:405-418.

Social Psychology

Talland, G. A.
Task and interaction process: Some characteristics of therapeutic group discussion.
J. Abnormal & Social Psychol. 50:105-109.

⁂

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

The Annual Meeting of the Staff Wives was held on May 3, at 10 A.M., in Bartlett Hall. Coffee was served before the meeting and greetings were exchanged between the Wives and Dr. Dean A. Clark, Mrs. Soma Weiss, and Miss Mary Ruth Wolf.

Mrs. Oliver Cope, our President, asked for reports from the various committees, and the following new officers were elected:

President—Mrs. Oliver Cope
Vice-President—Mrs. Charles B. Burbank, who is also our liaison with the Community Chairmen
Treasurer—Mrs. Charles L. Short
Secretary—Mrs. Joseph S. Barr
Publicity—Mrs. Morris H. Adler
Music Chairmen—Mrs. Milford D. Schulz and Mrs. John D. Crawford
Special projects—Mrs. Marshall K. Bartlett and Mrs. Richard H. Sweet
  Teas—Mrs. Jackson M. Thomas
  Housing—Mrs. Grant V. Rodkey
  Flowers—Mrs. Earle M. Chapman
Advisor to Distaff Club—Mrs. Reed Harwood
Community Chairmen
  Cambridge—Mrs. Robert N. Ganz
  Boston—Mrs. Wyland F. Leadbetter
  Brookline—Mrs. Benjamin Castleman
  Chestnut Hill—Mrs. John Homans
  Belmont—Mrs. Claude E. Welch
  Dedham—Mrs. Frederic Tudor
  Needham—Mrs. Frederic Tudor
  Milton—Mrs. Frederic Tudor
  Newton—Mrs. James H. Currens
  Lincoln—Mrs. Perry J. Culver
  Weston—Mrs. Perry J. Culver
  Watertown—Mrs. Perry J. Culver
  Waltham—Mrs. Perry J. Culver
  Lexington—Mrs. John P. Bunker
  Concord—Mrs. John P. Bunker
  Winchester—Mrs. Laurence L. Robbins
  Arlington—Mrs. Laurence L. Robbins
  Stoneham—Mrs. Laurence L. Robbins

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Alexander S. Macmillan, Jr. spoke on "Sinusitis" at the Postgraduate Medical Institute which was held on May 10 at the Veterans Administration Out-Patient Clinic in Boston. Dr. Macmillan is head of the X-ray Department at the Infirmary.

Dr. David D. Donaldson presented a paper, by invitation, at the annual meeting of the Optical Society of America in New York City on April 7. His subject was "Optical instrumentation for examination of the eye".

Dr. Carl G. Freese, who will begin his residency at the Infirmary in July, is now working in the Howe Laboratory with Dr. David G. Cogan.

On April 13, Dr. Charles L. Schepens spoke about eye surgery on the Blue Cross-Blue Shield television program.

The February issue of *The American Journal of Ophthalmology* contained two articles written by Dr. William Stone, Jr. —"A study of the growth of the anterior corneal layer in relation to the plastic artificial cornea", and "Photography of the anterior segment of the rabbit eye", written in conjunction with Leonard Reynolds. Both articles were printed from a speech which was delivered to the Association of Research in Ophthalmology in San Francisco last June by Dr. Stone.

Mr. Raymond C. Jahrling, plastic technician of ocular prosthetics, is working with Dr. Stone. He is doing research on the plastic cornea, as well as fitting patients with artificial eyes.

At the meeting of the Society of American Bacteriologists on May 9 in New York City, Dr. Robert S. Gohd spoke on "Requirement of calcium for the growth of influenza virus in tissue culture".

On May 11, Dr. Edwin B. Dunphy, Chief of Ophthalmology, spoke to a group of Naval Reserve doctors at the Children's Medical Center, and on May 21, he discussed "Clinical use of radioactive phosphorus" in a symposium held by the Pennsylvania Academy of Ophthalmology in Atlantic City.

Dr. Christine Bothner-By, formerly with Dr. Roger W. Jeanloz at the Massachusetts General Hospital, has recently joined the staff of the Retina Foundation. Dr. Bothner-By received her degree in Organic Chemistry from New York University in 1951.

On Thursday evening, April 21, Miss Dorothy M. Tarbox, Director of the Nursing Service at the Massachusetts Eye and Ear Infirmary, and her assistant, Miss Hilda G. Blaisdell, were honored by 180 friends at a farewell dinner, held at the Boston Club.

Dr. Thomas Cavanaugh, of the Ophthalmology Service, presided throughout the evening as master of ceremonies, with wit and graciousness. A most felicitous toast was proposed to the honored guests by Dr. Vincent J. Kelley, of the Otolaryngology Service. Following dinner, Miss Sally Johnson, Director *Emeritus* of the MGH School of Nursing and Nursing Service, gave a delightful and inspiring talk of reminiscence. Dr. Edwin B. Dunphy, in presenting gifts of diamond and pearl earrings to Miss Tarbox and Miss Blaisdell, also spoke with humor and appreciation of the many years of association with both these ladies.

Dr. Frederick H. Verhoeff, unable to be present, sent a telegram of greeting, saying in part, "When Miss Tarbox and Miss Blaisdell leave, it will seem as if the foundations of the Infirmary have been weakened, and an ache will be left in our hearts."

Although it was a sad occasion for those who love Miss Tarbox and Miss Blaisdell, it was also a memorable evening because of the sincerity and depth of feeling expressed for these two women who have given so much of their lives to the Massachusetts Eye and Ear Infirmary, to its patients, and to their coworkers.

To use one of Miss Tarbox's oft-repeated expressions, we can only say—"Land sakes", we shall miss you both!

Henrietta I. Olsen, Chairman,
Committee for the Farewell Dinner

BIOGLETS

Dr. Peter R. Bally, Assistant Resident in Medicine—born on March 21, 1921; Military Service: Swiss Army, 1944-45; M.D., University of Zurich, 1948; Intern, Seattle, Washington, 1950-51; Fellowship in Medicine, Peter Bent Brigham Hospital, Boston, 1952-54; home: Zurich, Switzerland.

Dr. Dean LaR. Moyer, Assistant Resident in Pathology—born in Allentown, Pennsylvania, March 17, 1925; U.S. Navy, 1944-46; B.A., Lehigh University, 1948; M.D., Medical School, University of Rochester, N. Y., 1952; Intern in Pediatrics, Children's Hospital, Los Angeles, California, 1952-53; Assistant Resident in Pathology. Children's Hospital, Los Angeles, 1953-54.

Dr. Leonard H. Plotkin, Intern in Children's Medicine—born in Hartford, Connecticut, October 16, 1923; U.S. Army Air Force: United States and Okinawa, 1943-46; B.A., American International College, Springfield, Massachusetts, 1950; M.D., Tufts College Medical School, 1954; married; home: Springfield, Massachusetts.

LEONA ZACHARIAS, PH.D. — FELLOW IN OPHTHALMOLOGY
MASSACHUSETTS EYE AND EAR INFIRMARY

Dr. Henning Pontoppidan, Assistant Resident in Anesthesia—born in Copenhagen, Denmark, July 24, 1925; M.D., University of Copenhagen Medical School, 1952; intern, Centralsygehuset Hjorring, Denmark, 1952-53; married; one child.

Dr. Majic S. Potsaid, Assistant Resident in Radiology—born in Pittsfield, Massachusetts, November 20, 1916; U.S. Army: Medical ADM Corps (discharged as Major), 1941-46; B.S., Yale University, 1947; M.D., Yale University Medical School, 1951; Intern, Central Maine General Hospital, Lewiston, Maine, 1951-52; general practice, Pittsfield, 1952-54; married: four children.

Dr. Gerold L. Schiebler, Intern in Children's Medicine—born in Hamburg, Pennsylvania, June 20, 1928; B.S., Franklin and Marshall College, Lancaster, Pennsylvania, 1950; M.D., Harvard Medical School, 1954: married

Dr. Katharine E. Spreng, Intern in Medicine—born in Cleveland, Ohio, November 22, 1927; A.B., Oberlin College, Oberlin, Ohio, 1950; M D., Western Reserve University, Cleveland, Ohio, 1954; home: Cleveland.

Dr. Oscar E. Starobin, Intern in Medicine—born in Worcester, Massachusetts, August 9, 1928: A.B., Harvard College, 1950 (active in the Harvard Band); M.D., Harvard Medical School, 1954; married.

Dr. Richard J. Stenger, Assistant Resident in Pathology—born in Cincinnati, Ohio, December 13, 1927; A.B., Holy Cross College, Worcester, Massachusetts, 1949; M.D., College of Medicine, University of Cincinnati, 1953; Intern, Cincinnati General Hospital, 1953-54; married.

Dr. Albert Van Eerde, Assistant Resident in Anesthesia—born in Camden, New Jersey, October 4, 1922: A.B., Princeton University, 1947; M.D., University of Pennsylvania Medical School, 1947; Intern, Orange Memorial Hospital, Orange, New Jersey, 1947-48; general practice for two and one-half years in Linden, New Jersey; U.S. Air Force: active duty at Sampson Air Force Base, N.Y., 1951-53; married; four children.

Dr. Setrag A. Zacarian, Resident in Dermatology—born in Worcester, Massachusetts, December 26, 1921; B.S., Tufts College, 1943; M.D., Boston University School of Medicine, 1947; Intern, Beverly Hospital, Beverly, Massachusetts, 1947-48; Assistant Resident in Medicine, Malden Hospital, Malden, Massachusetts, 1948-49; Teaching Fellow in Pathology, Tufts Medical School, 1949-50; U.S. Navy: Pathology and Dermatology at U.S. Naval Hospital, Camp Lejeune, North Carolina, 1951-52; Assistant Resident and Senior Assistant Resident in Dermatology and Syphilology, Duke Hospital, Durham, North Carolina, 1952-54.

New addresses:—

Dr. Russell V. Fuldner (*Or.* 1939), 178 Sherman Ave., New Haven 11, Conn.
Dr. Robert S. Grier (*E.M.* 1942), 4925 Trinity Drive, Los Alamos, N.M.
Capt. Arthur Haut, MC, USAR (*M.* 1950), 8-0-31 #7 MFSS, BAMC, Fort Sam Houston, Tex.
Dr. John W. Hayden (a.r.s. *Or.* 1955), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Helmuth Hilz, Ph.D. (res. fel. *Biochem.* 1955), Chemischen Laboratorium der Universit Munchen, Biochemische Abteilung, Munich, Germany
Dr. Lucie J. Jessner (r.p. *Psychiat.* (*McL.*) 1939), University of North Carolina, Chapel Hill, N.C.
Dr. J. Drennan Lowell (a.r.s. *Or.* 1953), 266 Beacon St., Boston, Mass.
Lt. David J. L. Luck, MC, USAR (*M.* 1954), 51st TAC Hospital, APO 235, c/o Postmaster, San Francisco, Calif.
Dr. Orville F. Rogers (*W.M.* 1913), 140 Ogden St., New Haven 11, Conn.
Dr. Warren R. Sisson (*C.M.* 1912), 203 Commonwealth Ave., Boston, Mass.
Dr. Henrik O. Tonning (clin. & res. fel. *M.* 1951), 44 Cobury St., Saint John, New Brunswick, Canada

---

Brief bits:—

During the meetings of the American Academy of Orthopedic Surgeons, held in Los Angeles in January, Dr. Otto E. Aufranc gave a course on "Mold arthroplasty". On April 11, Dr. Aufranc gave a talk on "The present status of mold arthroplasty" before the Detroit Academy of Orthopedic Surgeons.

Dr. Henry K. Beecher was the Alpha Omega Alpha Lecturer at the University of Louisville Medical School in April. He spoke on "New work on narcotics". At the dinner meeting he spoke on "Specialism as a problem in medical schools". Dr. Beecher was elected to membership in the American Surgical Association at their recent meeting in Philadelphia.

Dr. Edward B. Benedict gave a talk on "Endoscopy" to the Dorchester Medical Club on April 14.

Dr. Walter S. Burrage gave the Staige Davis Blackford (*E.M.* 1927) Memorial Lecture at the University of Virginia School of Medicine on April 25. His subject was "The effect of allergic reactions on small blood vessels". On April 27, at the Annual Session of the American College of Physicians, held in Philadelphia, Dr. Burrage spoke on "Guides to the use of cortisone and hydrocortisone in allergy". Dr. John W. Irwin joined Dr. Burrage, by invitation, in the lecture.

Dr. Edwin F. Cave lectured in Philadelphia on April 22, in a Fracture Course given by Professor Lorenz Bohler, from Vienna. Dr. Cave's subject was "Fractures involving the knee joint".

Dr. John H. Gibbon (Dalton Scholar 1935) presided as President of the American Surgical Association at the April meeting in Philadelphia.

Dr. William H. Horwitz (r.p. *Psychiat.* (*McL.*) 1951) announces the opening of his office for the practice of Psychiatry, at 82 Marlborough Street, Boston.

Dr. Roger W. Jeanloz of the Robert W. Lovett Memorial Laboratories has been invited by the Chemical Institute of Canada to deliver lectures before the sections of Montreal, Quebec, Deep River, and London (Ontario).

Dr. Russell M. Nelson (a.r.s. 1954) has finished his residency at the Minnesota University Hospital, and is now Assistant Professor of Surgery at the University of Utah.

In a "Brief bit" received from Dr. John W. Smillie (*E.S.* 1944) and published in the March issue of THE NEWS, an incomplete name of the organization to which Dr. Smillie has been elected as a Fellow was given us. Dr. Smillie says, in a later note, that the full name of the organization is the American Academy of Ophthalmology and Otolaryngology.

Dr. John D. Stewart (*E.S.* 1930) has recently been elected Chairman of the American Board of Surgery. Dr. Stewart succeeded Dr. Thomas H. Lanman (*E.S.* 1918). This is one of the most responsible assignments in surgical education.

Dr. Edward S. Welles (*E.S.* 1921) presided as President of the American Association for Thoracic Surgery at their meeting in Atlantic City in April.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL
1811

No. 147 Boston, Mass. July and August 1955

PSYCHIATRY SERVICE

1954 - 1955

This has been a year of transition from the active and vigorous leadership of Dr. Stanley Cobb to the guidance of Dr. Erich Lindemann. An important addition to our staff during this period of transition has been Dr. Carl Binger, who has supervised the work on consultations and has been very helpful in the teaching program. The essential service units of the ward, the Psychiatry Clinic, the Alcohol Clinic, and the Child Psychiatry Unit are continuing unaltered at present. Some new services have been added—consultants for the Family Health Program, for the Adolescent Endocrine Clinic, and for medical-social service rounds. The research program developed by Dr. Cobb has continued, and plans are under way for enlarging this.

Service to patients

The actual number of admissions to the ward has increased during the year because a larger number of patients were admitted for diagnostic work-ups. Thus, the number of patients getting intensive treatment on the ward has decreased somewhat. Our aim is to enlarge the Clinic to provide for a larger load of patients needing long-term care. The ward would serve such purposes as intensive, diagnostic studies, brief periods of intensive therapy, or protective care during crises that may arise during psychotherapy on the outside. The physician who refers a patient for care during a crisis continues his interest during the patient's hospitalization, even though provisions for care and therapy are in the hands of a resident at the time. This plan has been especially helpful to patients with alcoholism and neurotic character structures, who are having intensive therapy in the Alcohol Clinic. The great tendency of these patients to "act out" leads to crises of medical care which can be handled well by short admissions to the ward.

Another development leading to somewhat reduced time of hospital stay of individual patients has been our growing effort to find solutions for special problems of very "dependent" patients who formerly were prone to stay for a considerable time, having developed a clinging dependence upon their particular physician. As a result of Dr. Lindemann's work in Public Health and Dr. John C. Nemiah's experience with rehabilitation problems, we have become much concerned with the specific methods which go into helping a patient who is defective in "social skills" and remains in a dependent role, not so much because of neurotic conflicts but because of lack in ability to deal with human relations in an adequate manner. Both on the ward and in the Clinics the re-educational side of psychotherapy has been emphasized, and we are beginning to envisage modifications of the ward care program and an occupational therapy structure to facilitate "social learning".

We have also had this year an increase in the number of boarders from other services, who represent the acute psychotic episodes in the Hospital referred for quick appraisal and temporary care. Some of these patients have been of interest in connection with the effects of treatment with ACTH or cortisone. Other patients of equal interest developed states of behavioral disorganization in the course of treatment for psychosomatic disorders. We feel there is a very important place in a general hospital for the intensive study and care of such "casualties" and we hope to be able to enlarge and improve our facilities for this phase of the program.

The Clinic, under the direction of Dr. Peter E. Sifneos, has continued to serve primarily the other departments of the Hospital. New patients are evaluated by an intake team consisting of a senior psychiatrist, a resident, a social worker, a psychologist, and medical students. This plan was devised several years ago by Dr. Elizabeth R. Zetzel and Dr. Henry H. Brewster and has been helpful in making it possible for patients to have thorough evaluations shortly after their referral. For a while this system eliminated the waiting list in the Clinic, but the number of referrals has increased this last year beyond our capacity to handle all of them immediately.

Our Child Psychiatry Unit continues with an active program of service and research. Dr. Lucie N. Jessner left this spring to start a child psychiatry service and take an important part in the training program at the University of North Carolina. We regret losing her and are grateful to her for her work in establishing the Unit here. Dr. Gaston E. Blom acts as the general coordinator of the program, and we expect Dr. Samuel Kaplan of the James Jackson Putnam Children's Service to help as a senior supervisor. This year an arrangement has been made with Dr. Nathan B. Talbot for Dr. John H. Lamont to participate in work of the Adolescent Endocrine Clinic.

The Alcohol Clinic, under Dr. Alfred O. Ludwig, is now able to carry about 50 patients in active treatment. As its work has become known, the referring agencies are increasing in number. An intensive program of investigations concerning the background and adjustment patterns of these individuals is in progress.

The other research activities of the Department have continued vigorously. We temporarily lost a very good man in Dr. Gardner C. Quarton who, with his great skill and enthusiasm, was a key person in our laboratory and clinical activities. We expect him to return from the Navy next spring and resume his work on psychotic states resulting from endocrine disorders and from the administration of certain cortical steroids.

Dr. Nemiah's work, which started with the evaluation of patients who suffer from protracted back pain after accident or surgical procedures, has become significant for the Rehabilitation Program, not only on our Service, but in the rest of the Hospital. Dr. Nemiah has become an advisor to the Paraplegia Ward in the surgical building and Associate Physician in the Bay State Medical Rehabilitation Clinic. The initial observation that predictions can be made concerning probable protracted convalescence of patients who are undergoing surgery after fractures or other impairment has led to the consideration of specific psychotherapeutic approaches to these patients and also pointed to a new direction of thinking in terms of prevention of the depressive and emotionally decompensated states which offer obstacles to successful treatment once they are established. It appears that for certain individuals with psychological make-up requiring a considerable amount of vigorous activity in order to maintain emotional equilibrium, the enforced passivity of the hospital stay is a real hazard. A revision of the surgical program to reduce inactivity to a minimum, and an enrichment of the occupational therapy program to provide activities which are meaningful for the patient in the sense of genuine achievement, are being given a good deal of thought. It is not surprising that out of this joint concern with the Orthopedic Department we are developing a consultation program at the Peabody Home for Crippled Children. In general, we are approaching a program of which intensive psychotherapy and systematic steps for the care of psychoneurotic patients is still the focus, but which is expanding its horizon to include systematic consideration of rehabilitation and preventive psychiatry as part of an overall health program.

Of other research projects now in progress, Dr. Maria Lorenz is continuing her studies on language. She is broadening her interest to include expressive behavior in the study of language and gesture as it differs from patient to patient group, and to try to isolate the communicative, symbolic, on one hand, and the expressive quality of the language production on the other. Dr. Stanley Cobb has maintained a keen interest in these studies and is continuing his own investigative work on the neurological aspects of speech production.

The studies concerning psychosomatic disorders, in both the adult and child psychiatry fields, are proceeding most satisfactorily. Dr. Nemiah and Dr. Frances J. Bonner are continuing the study on the personality structure of patients who develop two different psychosomatic disorders. The child psychiatry group have been interested in the social determinants of psychosomatic disorders in children, particularly children with asthma and rheumatoid arthritis. They made intensive studies of the mothers of such children, which suggest a rather characteristic relationship between mother and sick child.

There is finally current a lively interest in the different reactions shown by individuals at various ages to severe stress. The group started with a study of children's reactions to surgical procedures, such as tonsillectomy. During the past year Dr. Robert T. Long has concerned himself with the emotional reactions and psychosocial backgrounds of children suffering from severe burns. His interest in the reactions of the children and the patterns of their emotional convalescence from the traumatic experience was shared by Dr. Oliver Cope.

One of the very important areas of reactions to overwhelming stress seems to us to be the field of attempted suicide. Dr. Sifneos has systematically reviewed the life histories and adaptive problems of a series of patients who attempted suicide, and he is trying to make a formulation of the critical situations which in our culture are often followed by suicidal attempts.

Dr. Morris E. Chafetz has been working with Dr. Joseph Stokes, III, of the Family Health Program, helping to develop a design for psychiatric participation in this important program. He is also continuing his studies in electroencephalography.

We have this year been building up our resources in experimental psychology by adding to our staff Dr. John M. von Felsinger, who has done interesting work with Dr. Henry K. Beecher in the Department of Anesthesia on the behavioral effects of a variety of sedative and intoxicating drugs. He is spending half of his time with us, and his experiences are immediately applicable to studies of the effect of more endogenous substances, such as the corticosteroids. Experimental psychology was further strengthened by having the half-time services of Dr. George A. Talland, who was trained at the Maudsley Hospital. He is dividing his time between the Neurology Service and our program. He is concerned with tachistoscopic studies concerning motivational determinants of cognitive functions. Dr. Talland, who worked in the Department of Social Relations at Harvard during the past year, also has considerable interest in the diagnosis of social behavior of psychoneurotic individuals in task-oriented groups. We hope that his studies will be of much relevance for our rehabilitation program, in connection with deficits in social skills mentioned above. Dr. Lovick C. Miller, Jr., Dr. Babette Whipple, and two fellows in psychology have assisted in the studies being done in child psychiatry. Dr. Gene M. Smith has been added to the team working in the Department of Anesthesia.

Future plans

One of the most urgent needs is the improvement of facilities for the care of patients who develop states of behavioral disorganization in the Hospital. At present our facilities for the care of the increased number of patients are far from adequate and necessitate excessive restraint of patients. Larger space, additional rooms for beds, and accommodations for recreation and occupational therapy are needed. This would enable us to keep some of these patients here longer, both for study and for treatment. We are working on plans for the improvement of this section of the ward, and for improving our facilities in the clinics, where the need is also great.

One important development for the future is the appointment of Dr. Alfred H. Stanton as Psychiatrist-in-Chief at the McLean Hospital. Dr. Stanton and Dr. Lindemann, whose interests in psychiatry coincide at many points, are planning joint programs at the McLean Hospital and at the Massachusetts General Hospital for service, teaching, and research.

Dr. George Saslow, formerly a Professor of Psychiatry at Washington University in St. Louis, will start work here on a full-time basis in July. His main area of interest will be in a program of comprehensive medicine, to be carried out in the Medical Clinic. He will also be active as a teacher, and will continue his research on measurement of human interaction in relation to psychiatric diagnosis and therapy.

Dr. Walter Mann, who has training in biochemistry and psychiatry, will start work on certain biochemical aspects of disordered behavior—disorders of certain phases of metabolism, states of depletion or insufficient presence of certain specific compounds.

Dr. Benjamin F. Gill, who has training in internal medicine in addition to his background in psychiatry, will do much to strengthen our liaison with the Gastrointestinal Clinic.

Our program will be enriched by the addition of a Mental Health Service, directed primarily toward services and research in Preventive Psychiatry. Generous support for this work has been provided by the Grant Foundation. This project involves the development of a service team for diagnosis and, if necessary, preventive intervention, plus an investigative team concerned with the origins of social maladjustment and with the spectrum of reactions to emotional crises. This team will include psychiatrists, psychologists, social workers, and social scientists. An important aim of this program will be the study of the mental health needs of the neighborhood surrounding the Hospital.

Erich Lindemann, M.D.,
Chief of Psychiatry Service

* * *

Mr. John T. Murphy, Director of our Pharmacy Department, was awarded the honorary degree of Doctor of Pharmacy at the annual commencement exercises of the Massachusetts College of Pharmacy in June.

Mr. Murphy was also presented with a $100 bond by the Gray Pharmaceutical Company for his "outstanding contribution in the field of pharmacy".

The resignation of Dr. Joe Vincent Meigs as Chief of Staff of the Vincent Memorial Hospital and Chief of the Gynecology Service of the Massachusetts General Hospital, effective July 1, has been announced by the Board of Trustees of the two Hospitals. This will relieve Dr. Meigs of his time-consuming administrative duties and allow him more time for his private practice and for his continuing responsibilities as Clinical Professor of Gynecology at Harvard Medical School and as Gynecologist at the Palmer Memorial Hospital and the Pondville State Cancer Hospital. In recognition of Dr. Meigs's distinguished and devoted service in the field of gynecology, he has been appointed, effective upon his retirement, Consulting Visiting Gynecologist at the Vincent Memorial Hospital and Consulting Visiting Surgeon at the Massachusetts General Hospital.

Before the appointment of Dr. Meigs as Chief of Staff of the Vincent Memorial Hospital in 1930, women doctors had always held this position. This small Hospital was founded in 1892, "for the purpose of establishing a hospital for the diseases of women, as a memorial to the late Mrs. J. R. Vincent". Mrs. Vincent was a generous and much-beloved actress of the famous Boston Museum Stock Company, and the Hospital has always received support from theatrical performances. Among its generous contributors were the actors Edwin Booth and Edward H. Sothern. In recent years it has received much of its support from the annual Vincent Club Show. The Vincent Club was formed in 1893 by a group of twenty-five young women, for the purpose of raising money for the Vincent Memorial Hospital. The most recent contribution to the Hospital from members of the entertainment field was a check for $15,000 from the Damon Runyan Fund, for work in the laboratory on cancer research.

As modern medical and surgical treatment and laboratory techniques make a small isolated hospital in this field impractical, the Vincent Memorial Hospital, in 1940, accepted the invitation of the Massachusetts General Hospital to become its gynecology unit, while still retaining its own identity and staff. In 1941, upon the affiliation of the two institutions, Dr. Meigs, a Visiting Surgeon at the Massachusetts General Hospital since 1938, became the Chief of its Gynecology Service. The following year he was appointed Clinical Professor of Gynecology at the Harvard Medical School.

That Dr. Meigs has an international reputation for his work in the field of gynecology is evidenced by his honorary membership in the Royal College of Surgeons of Edinburgh, the Royal College of Obstetricians and Gynecologists of London, and the Swenska Lakaresallskapet of Stockholm. In addition, he is an honorary member of the Edinburgh Obstetrical Society, the Society of Obstetricians and Gynecologists of Canada, the Sociedad de Obstetrics y Ginecologia de Buenos Aires, the International Society of Surgery, La Sociéte-Française de Gynécologie, the Athens Obstetrical and Gynecological Society, and the Sociedad Cubana de Obstetricia y Ginecologie.

Among the numerous American medical, surgical, and scientific associations with which Dr. Meigs is affiliated are: the American Surgical Association, the American Gynecological Society, the American Association for the Advancement of Science, the American Association of Gynecologists, Obstetricians and Abdominal Surgeons, and the Southern Surgical Association. He has served on the Board of Governors of the American College of Surgeons since 1947. He is a Diplomate of the American Board of Obstetrics and Gynecology, and of the American Board of Surgery.

Dr. Meigs graduated from Princeton University in 1915 and is the holder of the 1915 Merit Cup, presented to him by his Class in 1949. He graduated from Harvard Medical School in 1919. His publications include *Tumors of the female pelvic organs,* published by Macmillan in 1934; *Progress in Gynecology,* volumes I and II, which he edited with Dr. Somers H. Sturgis; and his recent book, *Surgical treatment of carcinoma of the cervix,* published by Grune and Stratton in 1954. In addition, Dr. Meigs has contributed many sections to various gynecological treatises and has written over one hundred fifty medical papers. He is on the advisory editorial committee of the *American Journal of Obstetrics and Gynecology,* the editorial board of *Fertility and Sterility,* and the advisory board of *Cancer.*

On Tuesday evening, May 10, a dinner was given at the Sheraton Plaza in honor of Dr. Meigs by the Trustees of the Vincent Memorial Hospital, the Board of Managers of the Vincent Memorial Hospital, and the Board of Managers of the Vincent Club. It was attended by about 300 of Dr. Meigs's friends and well-wishers. Dr. Thomas H. Lanman was Toastmaster. The speakers were Dr. Arthur W. Allen, Dr. Langdon Parsons, Mr. Henry C. Everett, Jr., and Mr. Louis Curtis. A few skits were presented by members of the Vincent Club. Dr. Meigs was presented with a Vincent Medal by Mrs. James F. Hunnewell, President of the Vincent Club, and a beautiful silver tray by Mrs. Nelson W. Aldrich, President of the Board of Trustees of the Vincent Memorial Hospital. It was a delightful dinner, enjoyed by all who attended.

The joint appointment of Dr. Howard Ulfelder as Chief of Staff of the Vincent Memorial Hospital, Chief of the Gynecology Service at the Massachusetts General Hospital, and Clinical Professor of Gynecology at the Harvard Medical School has been announced. The announcement was made by Mr. Louis Curtis, Chairman of the Board of Trustees of the Vincent Memorial Hospital, Mr. Francis C. Gray, Chairman of the Board of Trustees of the Massachusetts General Hospital, and Dr. George P. Berry, Dean of the Harvard Medical School.

Dr. Ulfelder graduated from Harvard College in 1932 and from the Harvard Medical School in 1936. He served both his internship and residency at the Massachusetts General Hospital.

During the war, Dr. Ulfelder was attached to the United States Army Medical Corps as Chief of the Surgical Service of the 55th General Hospital in England and later in France.

In addition to his work on the staff of the Massachusetts General Hospital, the Vincent Memorial Hospital, and on the faculty of the Harvard Medical School, Dr. Ulfelder is also Gynecological Physician at the Pondville Hospital and Consulting Surgeon at the Massachusetts Eye and Ear Infirmary.

Dr. Ulfelder is the author of many scientific publications in surgery and gynecology. He is co-author, with Dr. Langdon Parsons, of a textbook, *An atlas of pelvic operations,* published in 1953.

Dr. Ulfelder is a member of many scientific and medical societies, including the American College of Surgeons, the American Surgical Association, the Society of University Surgeons, and the Massachusetts Medical Society. He is the Secretary-Treasurer of the Eastern Surgical Society and the Society of Pelvic Surgeons.

The Board of Trustees, at their meeting on May 27, voted to appoint:

Dr. Joseph Albert as Assistant Resident in Dermatology for one year, beginning July 1;
Dr. Donald V. Baker, Jr. as Clinical Associate in Surgery, beginning May 16;
Dr. Kenneth E. Liffmann as Intern on the Dental Service for one year, beginning July 1;
Dr. James M. Shannon as Clinical Associate in Surgery, beginning May 15;
Dr. Joseph M. Stolman as Intern on the Dental Service for one year, beginning July 1;
Dr. Norman Trieger as Assistant Resident on the Dental Service for one year, beginning July 1.

At their meetings on March 9 and during May, the General Executive Committee voted:

To extend the appointment of Dr. Mary Smyth Coley as Intern on the Children's Medical Service from June 30 through December 31;
That the promotion of Dr. Adolf L. Gundersen to the position of First Assistant Resident in Surgery be made retroactive to July, 1, 1954.

To reappoint:

Dr. William R. Brewster, Jr. as Clinical and Research Fellow in Anesthesia for one year, beginning March 15;
Dr. George Eisenman as Research Fellow in Anesthesia for one year, beginning June 1;
Dr. John F. McGinty as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning May 27;
Dr. Donald O. Rudin as Research Fellow in Anesthesia for one year, beginning July 1;
Dr. Kurt F. Schmidt as Clinical and Research Fellow in Anesthesia for one year, beginning June 4;
Dr. Thorkild Waino-Andersen as Clinical Fellow in Anesthesia for one year, beginning May 18.

To appoint:

Dr. Walter H. Caskey as Clinical Assistant in Medicine, with the privilege of assisting Dr. John R. Graham in the care of his patients in the Baker Memorial and Phillips House;
Dr. Leo J. Cass as Clinical Assistant in Medicine, with the privilege of assisting Dr. John W. Cass, Jr. in the care of his patients in the Baker Memorial and Phillips House;
Dr. John L. Decker as Research Fellow in Medicine, beginning July 1;
Dr. Donald A. Hillman as Clinical and Research Fellow on the Children's Medical Service, beginning July 1;
Dr. Toshio Inahara as Clinical and Research Fellow in Surgery for one year, beginning July 1;
G. G. Krishna Murty, Ph.D. as Research Fellow in Biochemistry, beginning March 1;
Dr. John H. Sisson as Clinical Assistant in Medicine, with the privilege of assisting Dr. Richard P. Stetson in the care of his patients in the Baker Memorial and Phillips House;
Dr. John R. Ward as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Edward J. Welch as Clinical Assistant in Medicine, with the privilege of assisting Dr. Dwight L. Siscoe in the care of his patients in the Baker Memorial and Phillips House.

* * *

Dr. James C. White's 60th birthday was observed in a very special manner on June 11. Drs. William H. Sweet, H. Thomas Ballantine, Jr., and Louis Bakay, along with the neurosurgery house staff and fellows, were the hosts for the occasion. The guests included Sir Geoffrey Jefferson of Manchester, England, Dr. Wilder Penfield of Montreal, and Dr. Francis Grant of Philadelphia, as well as former residents in neurosurgery who had trained under Dr. White, and present and past members of the neurosurgery visiting staff.

Neurosurgical operations were performed in the morning. A luncheon was served in the Penthouse, with the resident staff acting as hosts. In the afternoon, there were visits to the clinical and research facilities of Dr. White's Neurosurgery Service, followed by a scientific session in the Bigelow Amphitheatre. Ten papers were presented, ending with Dr. White's talk on "The extent of cordotomy lesions as verified at postmortem examination". At 5:30, cocktails were served at the home of Dr. and Mrs. William H. Sweet in Brookline, after which the group repaired to the Aesculapian Room at the Harvard Club for dinner. Dr. William B. Scoville acted as toastmaster at the dinner.

Among the "old boys" who came to join in the celebration were Dr. Robinson LeR. Bidwell, II, of Portland, Maine, Dr. Samuel Brendler of Washington, D.C., Dr. John T. B. Carmody of Worcester, Dr. Raymond M. P. Donaghy of Burlington, Vermont, Dr. Hannibal Hamlin of Providence, Dr. Henry L. Heyl of Hanover, New Hampshire, Commander William J. James of USNH, Chelsea, Dr. Manucher Javid of Madison, Wisconsin, Dr. Samuel Lowis of Boston, Lieutenant Commander Robert W. Mackie of Bethesda, Maryland, Dr. Jost J. Michelsen of Boston, Dr. Federico Mora, now with the U.S. Air Force in San Antonio, Texas, Dr. Edwin H. Mulford, II, of Bridgeport, Connecticut, Dr. Richard G. Nilges of Gary, Indiana, Dr. William B. Scoville of Hartford, Connecticut, Dr. Bertram Selverstone of Boston, and Dr. D. Lawrence Sutherland of Windsor, Ontario.

Letters or telegrams expressing their regrets at not being able to come were received from "old boys" now practising in South Africa, England, France, Germany, Japan, and several far-away States in this country.

It was in every way a most rewarding and enjoyable party, and we venture to surmise that all those who were present wished that Dr. White might have another birthday celebration in the not-too-distant future.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Dermatology

Lever, W. F.
Fortschritte in der diagnose und behandlung des pemphigus.
Fortschr. d. Praktischen Dermatologie & Venerologie 2: 118-127.

Lever, W. F.
Primäre hypercholesterinämische xanthomatose und idiopathische hyperlipämie.
Fortschr. d. Praktischen Dermatologie & Venerologie 2:186-194.

Endoscopy

Benedict, E. B.
Medical progress: Endoscopy. (Continued)
New England J. Med. 252:759-767.

Benedict, E. B.
Medical progress: Endoscopy. (Concluded)
New England J. Med. 252:809-813.

General Medicine

Hardy, H. L.
Epidemiology, clinical character, and treatment of beryllium poisoning.
A.M.A. Arch. Indust. Health 11:273-279.

General Surgery

Waddell, W. R., Geyer, R. P., Olsen, F. R., Andrus, S. B., and Stare, F. J.
Clinical experience with intravenous infusion of emulsified fat.
J. Lab. & Clin. Med. 45:697-710.

Laboratory Science

McDermott, W. V., Jr., Adams, R. D., and Riddell, A. G.
Ammonia levels in blood and cerebrospinal fluid.
Proc. Soc. Exper. Biol. & Med. 88:380-383.

Neurophysiology

Brazier, M. A. B.
Studies of electrical activity of the brain in relation to anesthesia. (Josiah Macy, Jr. Foundation, New York, N. Y.)
In Neuropharmacology, Madison, N.J., Madison Printing Co., pp. 107-144.

Otolaryngology

Kelemen, G.
The nasal and paranasal cavities of the rabbit in experimental work.
A.M.A. Arch. Otolaryng. 61:497-512.

Brief bits:—

On May 19-22, at the invitation of the Mount Sinai Hospital of Greater Miami, Dr. Edward D. Churchill participated in the Fifth Annual Postgraduate Seminar on "Recent advances in diagnosis and therapy", held at the Fontainbleau Hotel, Miami Beach, Florida.

At the meeting of the American Psychosomatic Society in Atlantic City, May 5, Dr. Stanley Cobb was elected President for next year. The next meeting will be held in Boston, the last week in March, 1956.

Dr. Bernard M. Jacobson addressed the members of the Belknap County Medical and Dental Society in Laconia, New Hampshire, on May 10. He discussed bleeding disorders. On May 26, Dr. Jacobson made his annual trip to the Veterans Administration Hospital at Togus, Maine, where he participated in a teaching program and delivered a lecture.

During the week of June 6, Sir Geoffrey Jefferson, retired Professor of Neurosurgery at the University of Manchester, England, was Chief of Service pro tempore on the Neurosurgery Service.

Dr. Richard C. Webster attended the meeting of the American Association for Cleft Palate Rehabilitation on May 13, and presented a motion picture entitled "Posterior pharyngeal wall flaps in rehabilitation of complicated palate cases".

MASSACHUSETTS EYE & EAR INFIRMARY

The Harvard Medical School announces the appointments of Dr. David G. Cogan as Professor of Ophthalmology and Dr. W. Morton Grant as Associate Professor of Ophthalmology.

At a meeting of the Board of Managers, held on May 18, the following appointments were made:

Dr. Robert L. Goodale—Consulting Surgeon in Otolaryngology;
Dr. Donald K. Lewis—promoted from Assistant Surgeon to Associate Surgeon in Otolaryngology;
Dr. Daniel Miller—promoted from Assistant Surgeon to Associate Surgeon in Otolaryngology;
Dr. Charles L. Schepens—promoted from Assistant to Assistant Surgeon in Ophthalmology.

Additional appointments:

Dr. Fred C. Arragg—Graduate Assistant in Otolaryngology;
Dr. Tawfik F. Girgis—Resident in Otolaryngology;
Dr. Robert J. Herm—Assistant in Ophthalmology;
Dr. William W. Montgomery—Chief Resident in Otolaryngology;
Dr. Alvaro Rodrigues—Fellow in Ophthalmology, to work in the Retina Service;
Dr. Sidney R. Wilker—Graduate Assistant in Otolaryngology;
Dr. Arthur S. Woodward—Resident in Otolaryngology.

Dr. Richard B. Chapman has completed his residency in Ophthalmology and will be taking a year on the Eye and Ear Plastic Service. He has recently opened an office in Quincy, Massachusetts.

In the library of the Harvard Medical School there is an exhibit of neuroanatomical stereoscopic photographs. These are pictures of dissections done by Dr. David D. Donaldson of the Howe Laboratory, to illustrate visual and ocular motor pathways in the brain.

On May 24, Dr. George L. Bayadi of Cairo, Egypt, came to observe the Retina Service.

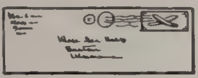
Dr. Edwin B. Dunphy and Dr. Paul A. Chandler attended the meeting of the American Ophthalmological Society in White Sulphur Springs, Virginia, June 1-5.

The Spring Meeting of the New England Oto-Laryngological Society was held on June 8, in the Upper Amphitheatre of the Massachusetts General Hospital. Dr. LeRoy A. Schall presided over the regular morning clinical session. During the afternoon session, seven papers were presented and the progress report of the

Winthrop Foundation was given.

On May 14, Dr. Philip E. Meltzer, Surgeon in Charge of the Winthrop Foundation at the Infirmary, was the principal speaker at the first convention of the Massachusetts Parents' Association for the Deaf and Hard of Hearing. His talk was on the medical aspect of deafness.

The March issue of the *Annals of Otology, Rhinology and Laryngology* was dedicated to the memory of Dr. Harris Peyton Mosher, former Chief of Otolaryngology at the Infirmary. In three biographical sketches—one by Dr. LeRoy A. Schall—Dr. Mosher is portrayed characteristically as an outstanding world figure in Otolaryngology. This presentation of the life history, personal philosophy, and motivation of Dr. Mosher, by men who knew him well, is truly a fitting tribute.



New addresses:—

Dr. Allan St. John Dixon (clin. & res. fel. *M.* 1955), Dept. of Rheumatology, Manchester Royal Infirmary, Manchester 13, England
Dr. Gerald S. Foster (*M.* 1952), 1101 Beacon St., Brookline 46, Mass.
Dr. John F. Gibbons (a.r. 1955), 20 Elmwood Rd., Cape Elizabeth, Maine
Helmuth Hilz, Ph.D. (res. fel. *Biochem.* 1955), Institut für Zell Chemie, Kraepelinstrasse 2, Munich 23, Germany
Dr. Merrill Lineback (*Otolar.* 1952), 28 8th St., N.E., Atlanta, Ga.
Dr. B. Harrison Ragle (*E.M.* 1917), 222 Marlborough St., Boston, Mass.
Dr. Stanley Sober (a.r.s. *Or.* 1953), 481 Colbourne St., London, Ontario, Canada
Dr. Robert H. Vose (*E.S.* 1897), 374 Commonwealth Ave., Boston, Mass.
Dr. Lester P. K. Yee (*E.M.* 1939 & *W.S.* 1941), 1641 Nuuanu Ave., Honolulu 17, H.I.

BIOGLETS

Dr. Justin R. Hüppe, Resident in Radiology—born in Oldenburg, Germany, October 24, 1921; University of Marburg, 1940; Military Service: Medical Corps of the German Army, 1941-45; Medical School, University of Göttingen, 1944-49; M.D., Göttingen, 1949; Intern in Medicine, Medizinische Klinik, University of Göttingen, 1950-51; Assistant Resident in Medicine, Marienkrankenhaus, Hamburg, 1952; Assistant Resident in Neurology, Neurologische Universitäts-Klinik, Hamburg-Eppendorf, 1952-53; Fellow in Radiology, Universitäts-Klinik, Hamburg-Eppendorf, 1953; Assistant Resident in Radiology, Buffalo General Hospital, 1954-55.

Dr. Edward Karamanoukian, Assistant Resident in Dermatology—born in Aintab, Turkey, March 23, 1915; junior college, Aleppo College, Aleppo, Syria; one year of college and five years of medical training, American University of Beirut, Lebanon; M.D., American University of Beirut, 1938; six months as Resident, Hamlin Tuberculosis Sanatorium, Lebanon; Resident, American Mission Hospital, Deirel-zor, Syria, 1939; general practice, Aleppo, 1940-55; home since 1920: Aleppo, Syria.

Dr. Donald P. Pederson, Assistant Resident in Anesthesia—born in Geneva, N.Y., November 22, 1926; A.B., University of Rochester, Rochester, N.Y., 1946; M.S., University of Rochester, 1950; M.D., University of Rochester, 1951; Intern in Surgery, Strong Memorial Hospital, 1951-52; Assistant Resident in Surgery, Strong Memorial Hospital, July-August 1952; U.S. Navy: Flight Surgeon, Atlantic Fleet Helicopter Squadron 2, 1952-55; married; three children; home: Melrose, Massachusetts.

Dr. John D. States, Assistant Resident in Orthopedic Surgery—born in Rochester, N.Y., June 16, 1925; A.B., University of Rochester, 1946; M.D., Harvard Medical School, 1949; Intern and Resident in Surgery, Rochester General Hospital; Military Service: Captain, U.S. Air Force, 1951-53; Assistant Resident in Orthopedics, Children's Medical Center, Boston, 1953-54; married; one son.

THYROIDOLOGICAL JOURNEY TO SOUTH AMERICA

A few months ago (November 19-December 12, 1954, to be exact), in the delightful company of John Stanbury and Gordon Brownell, I made a quick air tour to points in Peru, Chile, Argentina, and Uruguay.

The primary purpose of this trip was to make a project site visit to the Goiter Institute (Instituto del Bocio) of the University of Cuyo at the Central Hospital, Mendoza, Argentina. This had originated from the Andean Goiter Expedition of 1951, in which Stanbury, Riggs, and Brownell from the Massachusetts General Hospital joined forces with Perinetti, Itoiz, and del Castillo at Mendoza. This affair has already been mentioned in the September and December 1951 issues of THE NEWS, and the findings have been reported in full under the title "Endemic goiter—The adaptation of man to iodine deficiency" by the Harvard University Press, 1954. In contrast to the expedition of 1951, the Goiter Institute is a continuing enterprise led by Professor of Surgery, Hector Perinetti, and staffed entirely by members of the Faculty of Medicine of the University of Cuyo.

Our recent tour, however, had additional objectives. For one thing, we wanted to contact, in all the countries visited, as many as possible of our friends who had worked at the M.G.H., particularly in the Thyroid Clinic, in order to keep active our friendship with them and to promote scientific collaboration.

The timing of the tour was fixed so that we might also participate in the Third International Endocrinological Congress, which was held in Santiago, Chile, November 2-27. Finally, at the close of the Congress we gave a three-day course on "The use of radioactive isotopes in Medicine" at the Hospital del Salvador in Santiago.

Briefly, the progress of our tour was as follows: After a dazzlingly beautiful flight along the high Andes, we arrived at Lima on a Sunday morning. We foregathered with Dr. Alberto Hurtado (Harvard 1924), and saw his physiological laboratory for the study of problems of altitude. He has two laboratories—one in Lima at sea level, another at Morococha, high in the mountains at an altitude of about 16,000 feet. We were not able to get to the latter. Dr. Hurtado will be recalled as Harvard's Dunham Lecturer of 1952. We also had some all too hasty glimpses of the architectural and art treasures of both pre-Columbian and colonial Peru. This experience was of enormous interest to me because my brother, the late Philip A. Means, was an outstanding scholar in the archeology of this area, and this was my first visit to it.

After three days in Lima we flew to Santiago—a very beautiful city in a broad plain completely surrounded by mountains. The atmosphere of the place, as with all the cities we visited, is far more that of Europe than of North America. The Endocrinological Congress was held in the fine modern Hotel Carrera, with a finale at the coastal resort of Viña del Mar, near Valparaiso, reminiscent of the French Riviera. The meetings, which had been admirably planned, were very successfully carried out with skilled interpreters who overcame the difficulties of four official languages (Spanish, Portuguese, English, and French).

Fuller Albright was the guest of honor of the Congress. Slightly delayed by weather at the take-off in New York, as were we, he arrived, accompanied by Mrs. Albright, in his usual wonderful spirit, and joined heartily in all the activities of the Congress. His paper was in the place of honor at the end of the program. He had two sets of lantern slides (one in English, one in Spanish), two lanterns, two screens, two operators who put in the corresponding slides in unison. At the close he received a splendid ovation. Stanbury and Brownell also presented papers.

At Viña del Mar the authorities threw a glamorous banquet for us, with speeches, floor shows, señoritas with long black eyelashes, castanets, and all the Latin appurtenances. Professor Houssay responded to the greetings for South America, and Means for North America. We received, indeed, most wonderful hospitality in Chile from more people than can be mentioned in this brief account. Particular thanks are due to Professor A. Garretón Silva, Dean of the Faculty of Medicine, University of Chile, to Professors H. Alesandri Rodriquez, R. Armas Cruz, and Joaquin Luco, and to Doctors A. Atria, S. Middleton, R. Gazmuri, A. Jadresic, and J. Zañartu.

Throughout our stay in Chile our most intimate and devoted guide, counsellor, and friend was Dr. José Barzellato, who had spent one year with Dr. Stanbury in the MGH Thyroid Clinic. Barzellato is the spark plug of a very promising thyroid research group at the Hospital del Salvador, the teaching clinic of the University of Chile. It was through his inspiration and leadership that, following the Congress, the course on radio isotopes was given. Stanbury, Brownell, and Means participated in this course, also Professor Itoiz of Mendoza and J. Correia of Lima, both of whom have been at the M.G.H.—the latter for two years

No. 54 in a series of Staff photographs
Dr. Howard Ulfelder—Visiting Surgeon—newly appointed
Chief of Staff of the Vincent Memorial Hospital

in 1951-53. This course was well received and we all profited by it.

As soon as the final delightful Chilean luncheon had drawn to a close, we took off on a pressurized Convair for Mendoza, Argentina. The flight takes less than an hour, but it involves crossing the highest range of mountains in the world outside the Himalayan region. The passes were full of clouds, so we had to go over the top. As we crossed, the chief sight was that of pointed peaks on all sides sticking out of a substrate of cloud—a bad place to feather an engine, but fortunately we escaped that. A steep glide down the eastern slopes of the Andes brought us to Mendoza airport, where friends led by Professor Perinetti awaited us. We were at once taken to call upon the Governor of the Province of Mendoza, Señor Don Carlos Evans, and the Minister of Public Health and Welfare. Señor Don J. A. Denegri. Both of these gentlemen showed us every possible courtesy during our four-day stay in Mendoza.

The Hospital Central, a magnificent modern hospital and the teaching clinic for the new medical school of the old University of Cuyo, was, of course, our main objective in Mendoza. Here we saw in detail the Instituto del Bocio and discussed its program with our friends, Professors Perinetti, J. Itoiz, Fasciola, and many others. Brownell and I were made honorary members of the Faculty of Medicine. Stanbury had received this honor in 1951. We made speeches—Stanbury and Brownell on radioiodine, I on medical education. Also, we had a round of delightful entertainment, asados, visits to bodegas, a motor trip to the foothills of the Andes where Perinetti has a finca. This is the wine producing part of Argentina, and we had abundant opportunity to sample its vintages. Excellent they are, too.

After Mendoza we proceeded by air to Buenos Aires, with an unplanned bed and breakfast *en route* in lovely Cordova. In Buenos Aires we saw much of Professor Houssay, also of Drs. J. Reforzo Membrives, P. Cattogio, E. del Castillo, and Carlos Galli Mainini. All of these men have worked at the M.G.H.—Cattogio with Dr. Bauer, the rest in the Thyroid Clinic. We participated in a meeting of the Argentine Associations of Endocrinology and Diseases of Nutrition, and were made honorary members thereof. The high spots of the social program were a delightful luncheon at Reforzo's beautiful suburban villa at San Isidro, and a charming dinner at the apartment of del Castillo in the city. We visited the laboratory of Profesor Houssay where, in a converted private house, this master, undaunted by adverse circumstances, carries on his brilliant research, surrounded, as always, by gifted students. After four days in magnificent Buenos Aires, which really does look a bit like Paris, we took off by Pan American for the short hop to Montevideo. Soon after the take-off, however, we feathered an engine, and had to return and spend twenty-four hours at the airport while they put in a new one. This was no hardship, however, for Señor Peron's airport at Buenos Aires is one of the most luxurious in the world, with a large outdoor swimming pool, beautiful hotel, fine restaurant, rhumba orchestra, and so forth. We relaxed in these salubrious surroundings at the expense of PAA, and got off successfully a day late.

Montevidio, our last stop, was also delightful. Smaller then Buenos Aires, but with a style and beauty of its own, to say nothing of a refreshing air of freedom, it provided us with yet another delightful occasion.

My old friend, Professor J. C. Mussio-Fournier, who visited the M.G.H. in 1941, rushed to meet us at the excellent Hotel Victoria Plaza, and extended the courtesy of the University of Montevidio. In our short stay of thirty hours we visited the medical school, the new and enormous Hospital de Clinicas, and the older but fascinating Hospital Pasteur. At the latter, in Mussio's clinic, we engaged in a panel discussion of thyroidological matters. We were lunched and dined by such friends as Drs. Edwardo Canabel, Morato-Moreno, and others. The latter has a radioiodine enterprise, which we visited. Altogether, we squeezed the greatest amount of experience as possible into our very brief stay in Montevideo, and when it was over we boarded a plane which took us, with stops at Rio and Caracas, to New York in 26 hours flat. A superb flight, and so ended our adventure.

On our return to Boston, we all had the feeling that the objectives of the trip had been accomplished. The letters we have received since our return leave no doubt that mutual understanding and good will between medical scientists from north and south of the equator have been promoted. Particularly, the bonds between investigators of the thyroid from Boston, Santiago, Mendoza, Buenos Aires, and Montevideo have been strengthened. Our friends from South America have been coming to us for so long that it is good to know that at last we are also going to them.

James Howard Means, M.D.,
Member of Board of Consultation

THE NEWS

No. 148 Boston, Mass. September 1955

MEDICAL SCIENCE BUILDING ✓

The new Medical Science Building of the Massachusetts General Hospital, now under construction, is located on Charles Street between the Baker Memorial and the Phillips House. Approximately one-half of the building will house the new Pathology Laboratories; other floors will be devoted to laboratories for Dermatology, Neurology, Neurosurgery, and Psychiatry.

The building was designed by Shepley, Bulfinch, Richardson and Abbott, Architects. It is being constructed with foundations strong enough to support twelve stories. Work is progressing on schedule, and it is expected that the building will be ready for occupancy early in 1956.

Pathology

With the opening of the new Research Building in May 1951, the Trustees of the Massachusetts General Hospital placed the construction of new Pathology Laboratories high on the priority list and committed the balance in the Research Building Fund for this purpose.

The present Pathology Laboratory Building was constructed in 1895. At that time the Massachusetts General Hospital had 250 beds; today there are almost 1,000. This gives some idea of the inadequacy of the present facilities for our Pathology Service today. It is obvious that in overcrowded hospital space the full benefits and potentialities of modern pathology cannot be achieved, new and promising research projects cannot be undertaken, and the maintenance of records is hampered. The physician or surgeon and the pathologist must have the records of a patient readily available for comparison with those of others; such comparison sometimes eliminates the need for surgery and shortens the hospital stay. Nearly hopeless complications have been presented in trying to maintain adequate pathology record service in this old building. The Massachusetts General Hospital is anxious to improve and speed up its service to patients and do everything possible to shorten the hospital stay; and to accomplish this a new Pathology Laboratory is essential.

Another important contribution of the department, the training of young pathologists, is seriously handicapped by the shortage of space for investigation and routine work, and by the inaccessibility of the records in the present antiquated building at the Massachusetts General.

The new Medical Science Building will enable the Hospital to extend much-needed pathology service to many more hospitals, both large and small, throughout Massachusetts. What can be done with an adequate pathology laboratory for larger hospitals may be illustrated by the arrangement presently in effect with the Memorial Hospital in Worcester. Under this plan a senior member of the Massachusetts General Pathology Staff becomes Chief Pathologist of the other hospital, which pays his salary. He devotes full time to the participating hospital, except for a day or two each week reserved for research and teaching at the Massachusetts General Hospital. He brings to the Massachusetts General his problem cases for consultation with the Pathology Staff. In addition, the Massachusetts General supplies rotating resident pathologists, and the services of its Chief of Pathology as consultant.

For small suburban and rural hospitals, a member of the Massachusetts General Hospital Pathology Staff is appointed as liaison between the two hospitals. He attends their monthly staff and clinicopathological conferences, and arranges to have the necessary services performed. Laboratory work is sent to the Massachusetts General for processing. This arrangement has been followed successfully for many years at Emerson Hospital in Concord and the Brockton Hospital. All autopsies in these hospitals are done by MGH doctors. In this way doctors in many communities have the advantages of a large city hospital for their pathological needs.

With the rapid strides being made in medical science and with a nationwide shortage of pathologists, neuropathologists, and neurologists, the training of young doctors at the Massachusetts General Hospital became seriously handicapped by the inadequacy of space needed for investigation and routine laboratory work. This Hospital has laid heavy stress on teaching since its founding in 1811, and is internationally known for its activities in this field. At a recent date there were 321 student doctors in the Hospital, representing 36 States and 17 foreign countries, while 1,675 living graduates of the Hospital are practising in the 48 States and in 46 foreign countries. This gives some idea of the importance of our undergraduate and graduate teaching program. Graduates of the Massachusetts General have already established themselves in many New England communities, but many more are needed to fill the needs of local hospitals that have been too long without the benefits of modern science. In Massachusetts, 42 graduates of the Pathology Service are practising in communities throughout the State. Many are using their training in pathology to help them in the practice of medicine and surgery.

A comparison of statistics for the years 1900 and 1950 makes the inadequacies of the old plant quite clear:

1900	6-month period	1950
	AUTOPSIES	
46	Total number	321
33%	Chronic disease, including cancer	72%
58%	Acute infections	1%
9%	All other	27%
	1-month period	
	SURGICAL PATHOLOGICAL SPECIMENS	
113	Total number	804
1%	Chronic disease, including cancer	65%
	Liver biopsies in chronic cirrhosis	
	Kidney biopsies in hypertension	
	Endometrial biopsies in chronic menstrual disorders	
	Testicular biopsies in sterility and endocrine disorders	
	Dermatological biopsies	
	Collagen diseases	
	Thoracic surgery	
	Chronic tuberculosis	
	Chronic bronchiectasis	
	General surgery	
	Peptic ulcer	
	Chronic ulcerative colitis	
99%	All other diseases, including infectious diseases	35%

The comparison shows an increase of 700% in the number of autopsies; also a shift from 58% acute infections in 1900 to 1% in 1950. In 1950, deaths due to chronic disease, including cancer, occurred in 72% of the cases, against 33% in 1900.

Likewise, there was an increase of nearly 800% in the number of surgical pathological specimens in a one-month period; and again the shift from infectious disease to chronic disease is even more obvious. Whereas 99% of the surgical specimens in 1900 were classified as diseases other than cancer or chronic diseases, in 1950 cancer and chronic diseases amounted to 65%, and infectious and other diseases amounted to only 35%.

Neurology

The Medical Science Building will also provide new quarters for research in Neurology. Of all the patients admitted to the Medical and Pediatric Services of the Massachusetts General Hospital, 20% to 25% have as a primary or important component of their diseases a neurological disorder. With advances made in the control of infectious diseases and the correction of metabolic disorders, the incidence of neurological disease appears more obvious. The extension of life expectancy as a result of the elimination of many of the infectious diseases of infancy, childhood, and adolescence, has resulted in an older population and survival of more handicapped people in the community, consequently the incidence of degenerative diseases among the patients in this Hospital, as in all hospitals, is greatly on the increase. Many of these are neurological disorders, such as paralysis agitans, senile dementia, chronic forms of multiple sclerosis, and spastic disorders. Consequently, there has been a resurgence of interest in neurological medicine in the United States in recent years, as indicated by:

1. Innumerable demands from educators in the field of medicine, surgery, and pediatrics for special training of interns and residents in neurology. They have come to believe that a knowledge of the function of the nervous system is essential to an understanding of many medical diseases. The Massachusetts General Hospital has been anxious to provide more adequate quarters for this teaching program.
2. The development of strong neurology services, set up either as independent departments or as subdepartments of medicine. Neurology now has the task of extending its boundaries to include all other available approaches to the study of disorders of human behavior.
3. The realization that neurology is a broad field of medicine which includes all diseases of the nervous system—primary and secondary. It encompasses more than 200 diseases. The cause and pathogenesis of only a few of these diseases are known and, in fact, in many instances not even the morbid anatomy has been defined.

For these, and probably other reasons, there is a growing need for well-trained young neurologists. Some hospitals and diagnostic clinics throughout Massachusetts seek physicians who are expert in the diagnosis and management of neurological diseases. Many universities throughout the country, having recently set up separate departments of neurology, need teachers with an adequate background in neuroanatomy, neurophysiology, biochemistry, and neuropathology, who are also intimately acquainted with the clinical aspects of the more common diseases of the nervous system.

In the new Medical Science Building at the Massachusetts General Hospital, the Neurology Department will have facilities to provide training at undergraduate and graduate levels, both in clinical neurology and in all of the related medical sciences. In addition, it will be possible to provide for the training of young doctors who aspire to a career in neurology.

Dermatology

With the reorganization of the Department of Dermatology in the Harvard Medical School and the Massachusetts General Hospital in 1948, foremost among the objectives was the development of a new research laboratory. In this unit, men with the interest and scientific training, having a knowledge of the tools and methods of research, and possessing the ideas and ability to define the problems and undertake their solution, were to be assembled. The new dermatology floor in the Medical Science Building will provide the necessary facilities to accomplish this objective. It will contain an air-conditioned animal room and laboratories for biochemistry, histochemistry, cytology, and serology, as well as for tissue culture and microbiology. These sciences represent a few of the many avenues by which one may approach the unrevealed secrets of skin diseases.

For leaders in the field of cutaneous diseases there is urgent need for young men trained adequately in medicine and in one or the other of the basic medical sciences. With the tools of the science of his choice, he is then prepared to undertake the solution of the many problems related to the skin, in both health and disease. Research in dermatology has too often been of a superficial order. Basic problems in the structure and function of normal skin are many. These are chiefly biochemical. Upon their solution will rest an understanding of the mechanisms involved in the skin's diseases.

It is expected that the new laboratories will contribute a good deal to the education of the undergraduate and graduate medical student in the problems of modern dermatology, and in this way will contribute in no small measure to the educational facilities at the Hospital.

Psychiatry

In 1933, a development in psychiatry under joint sponsorship of Harvard and the Massachusetts General Hospital was made feasible by a grant from the Rockefeller Foundation. On nomination of joint ad hoc committees, Dr. Stanley Cobb was called to the M.G.H. to establish a teaching and research Department of Psychiatry. New wards for patients, research laboratories, and out-patient clinics were provided by extensive building alterations. A close working liaison with the McLean Hospital, the MGH unit for mental diseases, was made available. In 1941, the incorporation of the Hall-Mercer Hospital and the opening of its MGH division augmented the financial support and increased the scope of both clinical and research activities. In 1946, the McLean Hospital was strengthened by the building of a research laboratory and by the appointment of Dr. Jordi Folch-Pi as its Director and as Assistant Professor of Biological Chemistry. The appointment of Dr. Mark D. Altschule, Assistant Professor of Medicine, as Director of Internal Medicine and of Research in Clinical Physiology, and the equipment of a Laboratory of Clinical Physiology further rounded out the program at the McLean Hospital and provided a link with the Department of Medicine of the Harvard Medical School.

A Child Psychiatry Unit was established in 1948, largely through aid from the U.S. Public Health Service. In 1952, quarters on the seventh floor of the Burnham Building were finished. There, children from the clinic, the wards, and outside the Hospital are seen. This development enlarges our scope and is closely allied with the Children's Medical Service.

On July 1, 1954, Dr. Erich Lindemann was appointed Professor of Psychiatry at the Harvard Medical School and Chief of the Psychiatry Service here at the Hospital. Dr. Lindemann came to us with a wide range of interests, which include psychology, the social sciences, and public health. He therefore has plans for a large and more integrated Department of Psychology here, but his most important objective is improvement in the facilities for the care of emotionally disturbed patients. Space for such a unit will be provided in the new building, so that the M.G.H. can look forward to developing a program of medical care for all types of acute psychiatric disorders, in close integration with the staff and the facilities of the McLean Hospital.

Another important concern of the new department is the development of a program of preventive psychiatry. This will require much research concerning earliest symptoms and danger signals and concerning the causes of mental disorder, both in the area of the functions of the central nervous system and metabolic processes and in the area of the early human relations of the growing organism. Close integration of such studies with the work of Dr. Adams in Neurology, Dr. Bauer in Internal Medicine, Dr. Butler in Pediatrics, and others in the new Medical Science Building and elsewhere in the Hospital, will be made possible by joint planning. Also, in the immediate future, an active consultation program focusing on the emotional implications of all illness, with special emphasis on the rehabilitation of the chronically sick patient, promises new understanding of motivational factors which affect the speed of convalescence. Extending his concern to continued care and follow-up of the patients and their families, Dr. Lindemann is profoundly interested in the development of more adequate facilities for ambulatory care, not only in the Psychiatry Clinic proper but also in a general medical clinic in an expanding Family Service, and in an advisory service to the community in the neighborhood of the Massachusetts General Hospital in Boston and in the community surrounding the McLean Hospital in Waverley.

Neurosurgery

As the newer developments in branches of science having a known or a potential applicability in the field of medicine appear, the Massachusetts General Hospital is able to benefit from its close geographical, personal, and scientific relationships with the Massachusetts Institute of Technology. The common interest of the two institutions in supervoltage therapy has already resulted in a fruitful collaboration. Initially, all radioactive material used at this Hospital was obtained from M.I.T., and nearly twenty years ago, radioactive iodine, a produce of M.I.T.'s cyclotron, was being used experimentally at this Hospital to study thyroid physiology. The arrangement of casual consultation with the Department of Physics at M.I.T. has grown to one of close collaboration, with the staff of one institution seen often in the laboratories of the other.

On the recommendation of the Scientific Advisory Committee, of which Dr. Karl T. Compton, the late President of M.I.T., was an active member at the time, a Hospital physicist was recruited from the Department of Physics at M.I.T. in 1949, and today this man and another from the Acoustics Laboratory at M.I.T. are both closely connected with the research program at the Hospital. These men have already clearly demonstrated the possible advantages to both institutions of such a relationship. Few scientists in medical schools or teaching hospitals in the country have an opportunity for daily collaboration with men trained in the natural sciences. However, M.G.H. is favored by the presence of two men in the new Research Building at the Hospital, who bring from the Department of Biology at M.I.T. newer techniques of electron and ultraviolet microscopy in the pursuit of studies of arthritis and malignant diseases. Another man with similar training will bring these techniques to the research program of the Pathology Department in the new Medical Science Building.

It may well be that future experimental advances in knowledge of the functioning of the nervous system and the treatment of neurological diseases may be largely dependent upon neurosurgical techniques coupled with utilization of basic discoveries in the fields of electronics and nuclear physics. For this reason we welcome the proposed establishment of the Compton Laboratory at M.I.T. and look forward to the expansion thereby of our present collaborative efforts. It is obvious, however, that for this collaboration to be efficient and fruitful, adequate research space must also be made available at the Massachusetts General Hospital. After construction of the new Medical Science Building was started, it was decided to add a floor in the initial construction contract so that the building would house the laboratories of the Departments of Pathology, Neurology, and Psychiatry—in essence, the beginning of a neurological institute. After the construction contract was let, it became apparent that expansion of research projects involving neurosurgical techniques belonged in this building.

The specific projects now under investigation involving members of the Neurosurgical Service include two general groups in which there is already the closest collaboration between M.I.T. and M.G.H., in the persons of Dr. Gordon L. Brownell in nuclear physics and Dr. Theodor F. Hueter in ultrasound.

David C. Crockett,
Associate Director for Resources and Development

* * *

Dr. Claude E. Welch was awarded the honorary degree of Doctor of Science by Doane College on May 30. Dr. Welch graduated from Doane in 1927.

SOCIAL SERVICE DEPARTMENT

The Fiftieth Anniversary of the birth of our Social Service Department will be celebrated from October 20 through 22. The program for the occasion is as follows:

Thursday, October 20—Alumnae Day

The program on this day is planned particularly for former members of the Department, including professional workers, students, aides, secretaries, and volunteers.

Morning: Registration
Afternoon: History of the Social Service Department
Reports and discussion
Social hour with Miss Cannon
Evening: Supper at the Hospital, with skits and other gaiety

Friday, October 21—General Program

Morning: Meetings (lasting 1½ hours)

1. Professional teamwork in care of the patient
   The present status and future tasks of professional teamwork, discussed by various team members (physician, nurse, and social worker)
2. Cooperation between Hospital Administration and Social Service
   For hospital and social service executives, board, and advisory committee members
3. Teaching of medical students
   Description and evaluation of present methods by medical and social work teachers
4. The total program of Social Service in a health agency
   Combining the basic functions of Social Service (administration, consultation, casework, teaching, research, and community activities) in a balanced program
5. Cooperation with community casework agencies
   For members of hospital and community agency staffs

Workshops (lasting entire morning)

A. Social casework in a medical setting
   Focusing on work with patients and families
B. Social casework in a medical setting
   Focusing on the role of the social worker in medical teamwork, either in individual contacts or in organized multidiscipline conferences with members of other professions
C. Social research in a medical setting
   Efforts will be made to define the essentials of an ongoing research program for a social service department in a teaching hospital, focused on study and evaluation of social work practice
D. Teaching of social work students
   Definition of criteria for student progress in field work
   For field work supervisors of medical and psychiatric social students

Afternoon: Buffet lunch at the Hospital
General meeting: "Integrating the medical effort"
Panel discussion by a group of experts (a medical clinician, a psychiatrist, a nurse, a social worker, a sociologist, a hospital administrator, and a medical statesman)
Evening: Cocktail hour and banquet, Harvard Club

Principal speaker—Professor Elliott Dunlap Smith, Provost of Carnegie Institute of Technology, Pittsburgh, Pennsylvania

Saturday morning, October 22

1. Reports and evaluation
   Reports of findings and recommendations from the meetings and workshops of the two previous days
2. Concluding paper by Harriett M. Bartlett: "Fifty years of social work in the medical setting—Past significance and future outlook"

The Board of Trustees, at their meetings on April 15, June 10 and 24, and July 22, voted:

To create the position of Associate Sociologist in the Department of Psychiatry;
To terminate the appointment of Dr. Verner S. Johnson as Senior Resident in Orthopedic Surgery, as of December 31, 1955;
To grant leave of absence to Dr. Fritz Lipmann, from June 16 through August 31;
To reappoint Dr. Herbert B. Locksley as Second Assistant Resident in Neurosurgery, beginning July 11;
To extend the appointment of Dr. Richard A. Mayo as Assistant Resident in Orthopedic Surgery, through December 31;
To grant leave of absence to Dr. Edward P. Richardson, Jr., for four or five months;
To grant leave of absence to Dr. Leonard J. Rothfeld, for the period June 17 through June 30.

To appoint:

Dr. H. Arto Aprahamian as Assistant Resident in Anesthesia, beginning January 1, 1956;
Dr. Henrik H. Bendixen as Assistant Anesthetist;
Dr. Alexander Breslow as Third Assistant Resident in Pathology for one year, beginning July 1, 1956;
Dr. Jimmie C. Brockman as Resident in Psychiatry, from July 1 through December 31;
Dr. Nancy L. R. Bucher as Associate Biologist (Medicine), for the period July 1, 1955 through June 30, 1958;
Dr. Leonard W. Cronkhite, Jr. as Assistant in Medicine for one year, beginning July 1;
Dr. Reynout Donner as First Assistant Resident in Pathology for one year, beginning July 1, 1956;
Dr. Melvin J. Glimcher as Senior Resident in Orthopedic Surgery, for the period January 1, 1956 through June 30, 1956;
A. Paul Hare, Ph.D. as Associate Sociologist in the Department of Psychiatry;
Dr. Raymond N. Kjellberg as Second Assistant Resident in Neurosurgery, beginning July 1;
Dr. Victor Politano as Assistant Urologist, effective August 1;
Dr. Duncan E. Reid to the Consulting Staff;
Dr. George Saslow as Psychiatrist, beginning July 1, with the privilege of seeing private patients at the Hospital;
Dr. Gerold L. Schiebler as Assistant Resident in Medicine, beginning July 1;
Dr. Jesse F. Scott as Associate Biophysicist (Medicine), for the period July 1, 1955 through June 30, 1958;
Dr. Joseph Stokes, III, as Assistant in Medicine, effective July 1;
Dr. Moses M. Suzman as Visiting Physician pro tempore, for two weeks, beginning June 20.

At their meetings during June and on July 20, the General Executive Committee voted:

To promote:

Dr. Arthur E. Baue to the position of Third Assistant Resident in Surgery, beginning July 1;
Dr. Leland C. Brannon to the position of Resident in Neurosurgery, beginning July 11;

Dr. David L. Collins, Jr. to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Oscar S. DePriest, III, to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Harry B. Ditmore, Jr. to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. Edward Dunn to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Walter M. Haynes, Jr. to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Gilbert Hermann to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Clement A. Hiebert to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. John H. Kennedy to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Richard N. Kleaveland to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Walter E. Klingensmith to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Harold L. May to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. George B. Murphy, Jr. to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. Eugene R. Nobles, Jr. to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Demetrios A. Papadopoulos to the position of Resident in Urology for one year, beginning July 1;

Dr. James A. Petersen to the position of Resident in Radiology, beginning July 1;

Dr. John D. Pitts to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Majic S. Potsaid to the position of First Assistant Resident in Radiology, beginning July 1;

Dr. Stuart E. Price, Jr. to the position of Third Assistant Resident in Surgery, beginning July 1;

Dr. Jens G. Rosenkrantz to the position of Second Assistant Resident in Surgery, beginning July 1;

Dr. Richard L. Rovit to the position of First Assistant Resident in Neurosurgery, beginning July 1;

Dr. Robb H. Rutledge to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Frederick G. Shaffer to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Jack E. Tetirick to the position of First Assistant Resident in Surgery, beginning July 1;

Dr. Giles D. Toll to the position of Second Assistant Resident in Surgery, beginning July 1.

To extend the appointments of:

Dr. Franca Bonotti as Fellow in Anesthesia, through July 31;

Theodor F. Hueter, Ph.D. as Research Fellow in Physics, assigned to Neurosurgery, retroactive to January 1, through December 31;

Dr. Richard J. Stenger as Third Assistant Resident in Pathology, from July 1 until such time as he is called to active military duty;

Dr. Elliott B. Sweet as Clinical and Research Fellow in Orthopedic Surgery, from July 1 through December 31.

To reappoint:

Dr. Robert S. Adams as Clinical Fellow in Child Psychiatry for one year, beginning July 1;

Dr. Norman W. Andrew as Assistant Resident in Anesthesia for one year, beginning August 1;

Dr. Saul Aronow as Research Fellow in Physics for one year, beginning July 20;

Dr. Daniel M. Bachman as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. John S. Barlow as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. Norman R. Bernstein as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Mandel E. Cohen as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. Willard Dalrymple as Clinical Assistant in Medicine, beginning August 1;

Dr. Francis L. A. deMarneffe as Clinical Assistant in Psychiatry for one year, beginning July 1;

Dr. Leon I. Goldberg as Research Fellow in Anesthesia for one year, beginning June 4;

Dr. Joachim S. Gravenstein as Fellow in Anesthesia for one year, beginning August 16;

Dr. Salomon Hakim as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. Dorothy H. Henneman as Research Fellow in Anesthesia for one year, beginning September 1;

Dr. William H. Horwitz as Clinical Fellow in Psychiatry for one year, beginning September 1;

Elizabeth B. Keller, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning July 1;

Dr. Lowell W. Lapham as Research Fellow in Neuropathology, for three months, beginning July 1;

Mr. Alden V. Loud as Research Fellow in Medicine for one year, beginning July 1;

Dr. Sholem Postel as Clinical and Research Fellow in Medicine for one year, beginning July 15;

Dr. Nancy Rollins (Youse) as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Ann Ross, A.B. as Research Fellow in Psychology for one year, beginning July 1;

Dr. John A. Scholl as Clinical and Research Fellow in Neurosurgery, for six months, beginning July 1;

Dr. Mary L. Scholl as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Gene M. Smith, Ph.D. as Research Fellow in Anesthesia for one year, beginning September 1;

Leonard B. Spector, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning July 1;

Dr. Chiu-chen Wang as Research Fellow in Radiology, through December 31;

Babette S. Whipple, Ph.D. as Research Fellow in Psychology for one year, beginning September 1.

To appoint:

James E. Anliker, Ph.D. as Research Fellow in Anesthesia for one year, beginning July 15;

Dr. Rafael M. Casas as Clinical and Research Fellow in Surgery for one year, beginning July 1;

Dr. James C. Davis as Research Fellow in Pathology for one year, beginning November 1;

Dr. Elias C. Dow as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Pierre M. Dreyfus as Research Fellow in Neuropathology for one year, beginning July 1;

Dr. Joseph I. Engler as Clinical and Research Fellow in Medicine, assigned to Allergy, for one year, beginning August 1;

Dr. Lamont W. Gaston as Clinical and Research Fellow in Medicine, for six months, beginning July 1;

Elizabeth Gellert, M.A. as Research Fellow in Psychology, beginning July 1;

Dr. Herschel A. Graves, Jr. as Clinical Fellow in Surgery, assigned to Gynecology, for the months of July and August;

Dr. Thomas P. Hackett as Clinical and Research Fellow in Psychiatry, beginning July 1;

Dr. Arthur W. Hazenbush as Graduate Student Assistant in Orthopedic Surgery, for six months, beginning July 5;

Dr. William P. Jencks as Research Fellow in Biochemistry for one year, beginning September 1;

Dr. Jacob D. Judah as Research Fellow in Biochemistry for one year, beginning September 1;

Heinz Kohler, Ph.D. as Research Fellow in Biochemistry for one year, beginning September 1;

Dr. Cesare T. Lombroso as Research Fellow in Neuropathology for one year, beginning July 1;

Dr. William B. Looney as Clinical and Research Fellow in Medicine, beginning September 19;

Dr. Alfred J. Luessenhop as First Assistant Resident in Neuropathology, beginning July 1;

Dr. John D. McQueen as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. Herbert C. Mansmann, Jr. as Research Fellow in Neurology, for the period July 1 through September 30;

Ruth G. Matarazzo, Ph.D. as Research Fellow in Psychology for one year, beginning July 1;

Dr. John Mealey, Jr. as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. Dagoberto Sosa Montalvo as Clinical and Research Fellow in Neurosurgery, for six months, beginning July 1;

Dr. George E. Murphy as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. David W. Richards as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Phillips W. Robbins, Ph.D. as Research Fellow in Biochemistry, beginning September 1;

Dr. John C. Rowe as Clinical Fellow in Medicine, beginning July 1;

Dr. Sabino J. Sinesi as Clinical and Research Fellow in Dermatology for one year, beginning July 1;

Dr. Burton Stulberg as Clinical Fellow in Psychiatry for one year, beginning July 18;

Dr. Eji Suyama as Clinical Assistant in Surgery, for the period July 5 through August 15, with permission to act as Dr. L. S. McKittrick's assistant in Baker Memorial and Phillips House;

Dr. Julio Toriello as Clinical Fellow in Radiology, for the month of July;

Dr. Lawrence H. Warbasse, Jr. as Clinical and Research Fellow in Medicine, beginning September 1;

Dr. Leonard Weiner as Clinical Fellow in Psychiatry for one year, beginning July 1.

The General Executive Committee also voted:

To rescind the promotions of Drs. Gerald M. Edelman and Glenn A. Langer as Assistant Residents, beginning July 1, as they have left for military service;

To terminate the appointment of Dieter M. Schmid, Ph. D. as Research Fellow in Medicine as of August 20, because of his return to Switzerland;

That Dr. Katharine E. Spreng will begin service as Assistant Resident in Medicine on July 1 rather than October 1;

That Dr. Ralph C. Williams, Jr. will begin service as Assistant Resident in Medicine on October 1 rather than July 1.

* * *

VOLUNTEER GROUPS

MGH STAFF WIVES HOSPITAL COMMITTEE

While many of us were away on vacations at the seaside or the mountains or in countries abroad, others of us were at home, enjoying the privilege of meeting many of our visitors from other lands. On July 14, eighteen visitors from Australia, Brazil, Denmark, England, France, Egypt, Japan, Italy, and Spain came to the Massachusetts General Hospital. They were brought to this country by the State Department, to inspect atomic energy installations and cancer projects in the United States. In order to make their visit interesting and for them to learn something about our lives, they were invited to dinner at the homes of Dr. and Mrs. Morris H. Adler, Dr. and Mrs. Joseph C. Aub, Dr. and Mrs. Robert L. Berg, Dr. and Mrs. Stephen M. Krane, Dr. and Mrs. Arthur S. Pier, Jr., Dr. and Mrs. John D. Stoeckle, Dr. and Mrs. Claude E. Welch, and Dr. and Mrs. Stanley M. Wyman. We found our guests to be delightful people, with stimulating and exciting stories of their lives at home and of their tour of the United States. A feeling of rejuvenated enthusiasm for greater accomplishments was injected into our lives that evening when we met and talked with these friends from other parts of the world.

Our new Reception Center will be open each weekday beginning September 26, from 9 A.M. until 4 P.M. Post cards will be sent out, informing the ladies of the opening of the Reception Center and their assignments of work days.

An indoctrination talk will be given by Miss Mary Ruth Wolf, Director of our Volunteer Unit, on September 21, from 9 A.M. until 12 noon, and from 2 until 5 P.M. We are having the two sessions so that if you cannot come to one, you might be able to attend the other. Instructions given in the talk will so well orient us with the Hospital that, when visitors come to our Reception Desk, we will be able to direct them efficiently to their proper destinations.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Appraisal of drugs intended to alter subjective responses, symptoms.
J.A.M.A. 158:399-401.

Bunker, J. P., Stetson, J. B., Coe, R. C., Grillo, H. C., and Murphy, A, J.
Citric acid intoxication.
J.A.M.A. 157:1361-1367.

Dermatology

Blank, I. H.
Mechanism of the action of agents used for the relief of dry skin.
Proc. Scient. Sec. Toilet Goods Assoc. 23:19-23.

Herbst, F. S. M., Lever, W. F., and Hurley, N. A.
Idiopathic hyperlipemia and primary hypercholesteremic xanthomatosis. VI. Studies of the serum proteins and lipoproteins by moving boundary electrophoresis and paper electrophoresis before and after administration of heparin.
J. Invest. Dermat. 24:507-525.

Digestive Tract Diseases

Jones, C. M.
Diseases of the esophagus.
In Textbook of Medicine, R. I. Cecil and R. F. Loeb, Editors, Philadelphia, W. B. Saunders Company, ed. 9, pp. 839-844.

Jones, C. M.
Panel on liver disease (with Drs. A. M. Snell, R. Kark, H. R. Butt, and V. Shorov).
J.A.M.A. 158:116-121.

General Medicine

Burrage, W. S., and Irwin, J. W.
Hydrocortisone in the therapy of asthma.
Ann. New York Acad. Sciences 61:377-383.

Burrage, W. S., and Irwin, J. W.
The use of intravenous hydrocortisone in asthma.
Ann. New York Acad. Sciences 61:460-463.

Henneman, P. H., Wang, D. M. K., Irwin, J. W., and Burrage, W. S.
Syndrome following abrupt cessation of prolonged cortisone therapy.
J.A.M.A. 158:384-386.

General Surgery

Soutter, L., Scannell, J. G., and Myers, G. S.
Pneumonectomy and pulmonary valvulotomy in the treatment of active tuberculosis and pulmonary stenosis. Report of a case.
J. Thoracic Surg. 30:49-56.

Laboratory Science

Geyer, R. P., Olson, F. R., Andrus, S. B., Waddell, W. R., and Stare, F. J.
Preparation of fat emulsions for intravenous alimination.
J. Amer. Oil Chem. Soc. 32:365-370.

Matoltsy, A. G., and Odland, G. F.
Investigation of the structure of the cornified epithelium of the human skin.
J. Biophys. & Biochem. Cytol. 1:191-196.

Neurology, Neurosurgery, and Psychiatry

Barrows, L. J., Hunter, F. T., and Banker, B. Q.
The nature and clinical significance of pigments in the cerebrospinal fluid.
Brain 78:59-80.

Otolaryngology

Weille, F. L.
The significance of the arteriovenous arcades of the spiral ligament of the cochlea.
Ann. Otol., Rhin. & Laryng. 64:173-180.

Surgery—Reconstructive

Webster, R. C.
Abrasive surgery for certain facial deformities.
New England Sanitarium and Hospital Spectator 6:2.

Books

Richardson, W.
The house on Nauset Marsh.
New York, W. W. Norton & Company, Inc.

MASSACHUSETTS EYE & EAR INFIRMARY

At the recent meeting of the American Medical Association, Dr. David G. Cogan was awarded the Knapp Medal by the Ophthalmic Section, for the excellence of his paper which was read at the 1953 meeting. In presenting the medal to Dr. Cogan, Dr. Frederick H. Verhoeff, Chairman of the Award Committee, said, "Because of the excellence of this paper, and also because of his many other accomplishments and the high esteem in which he is held, the award of the medal to Dr. Cogan will greatly add to the satisfaction of those who received the medal in the past, and enhance the efforts of those who will compete for it in the future."

The Massachusetts Lions Eye Research Committee has announced the establishment of a $25,000 eye research fellowship in honor of Dr. Edwin B. Dunphy, Chief of Ophthalmology at the Infirmary.

Dr. Verhoeff, a native of Louisville, Kentucky, Emeritus Professor of Ophthalmic Research at Harvard and Consulting Chief of Ophthalmology at the Infirmary, was awarded the honorary degree of Doctor of Science by the University of Louisville on June 5.

Dr. Robert J. Herm announces the opening of his office for the practice of Ophthalmology at 314 Main Street, Melrose, Massachusetts.

Staff appointments:

Dr. Richard B. Chapman, Assistant in Ophthalmology;

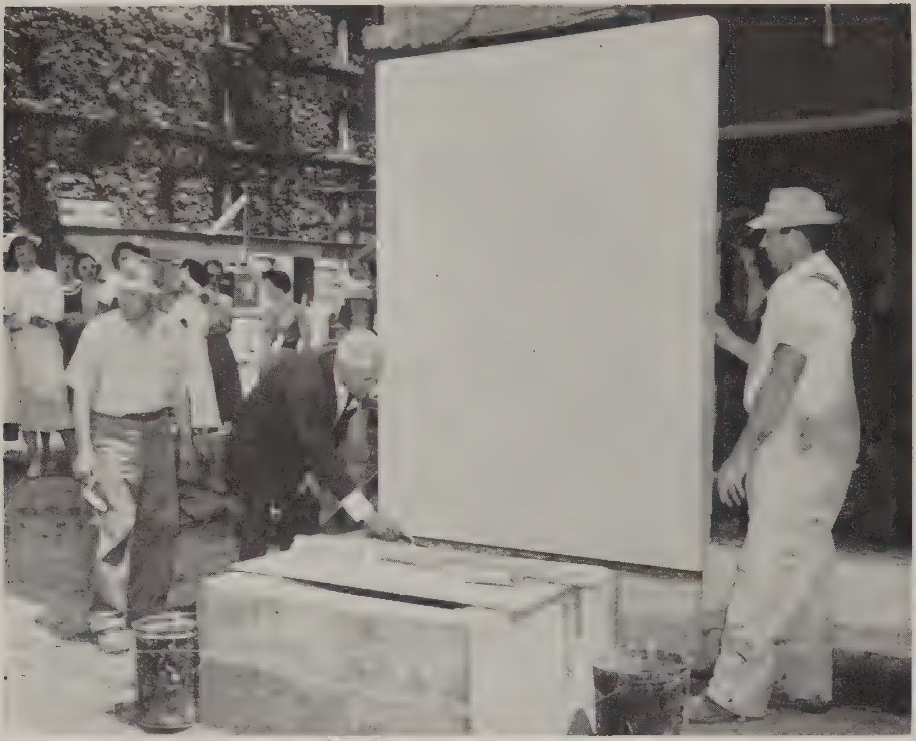
Dr. Daniel F. Milam, Jr., Assistant in Ophthalmology;

Dr. Taylor R. Smith, Associate Pathologist in Ophthalmology.

BIOGLETS

Dr. Martin R. Coles, Assistant Resident in Psychiatry—born in Boston, Massachusetts, October 12, 1928; A.B., Harvard College, 1950; M.D., Columbia University College of Physicians and Surgeons, 1954; Intern, University of Chicago Clinics, 1954-55; home: Boston, Massachusetts.

Dr. Roman W. DeSanctis, Intern in Medicine—born in Cambridge Springs, Pennsylvania, October 30, 1930; B.S., University of Arizona, 1951; M.D., Harvard Medical School, 1955; married; home: Tucson, Arizona.



During the ceremonies at the laying of the cornerstone of the new Medical Science Building on June 23, Mr. Francis C. Gray, Chairman of our Board of Trustees, assists in placing the granite marker at the corner of the building.

Dr. Frederick S. McAlpine, Assistant Resident in Anesthesia—born in Monessen, Pennsylvania, June 16, 1929; A.B., St. Vincent College, Latrobe, Pennsylvania, 1950; M.D., University of Pittsburgh School of Medicine, 1954; rotating internship, Bethesda Naval Hospital, Bethesda, Maryland, 1954-55; single; at present on active duty with the U.S. Navy as Lieutenant, j.g., at Massachusetts General Hospital; home: Monessen, Pennsylvania.

Dr. Charles F. McKhann, III, Intern in Surgery—born in Boston, Massachusetts, January 29, 1930; B.A., Harvard College, 1951; M.D., University of Pennsylvania, 1955; home: Haverford, Pennsylvania.

Dr. Marvin D. Siperstein, Assistant Resident in Medicine—born in Minneapolis, Minnesota, September 21, 1925; U.S. Army: Pfc, Army Special Training Program, 1943-46; B.S., University of Minnesota, 1946; M.D., University of Minnesota Medical School, 1948; Intern, University of Chicago Clinics, 1948-49; Ph.D., University of California, Berkeley, 1952; U.S. Public Health Service: Senior Assistant Surgeon, National Institutes of Health, Bethesda, Maryland, 1953-55; married.

New addresses:—

Dr. Franca Bonotti (clin. fel. *An.* 1955), Viale Giulio Cesare #51, Rome, Italy
Dr. Samuel Brendler (sr. r.s. *N.S.* 1953), Walter Reed Hospital, Washington, D.C.
Dr. Charles R. Campbell (r.p. *Path.* 1955), University of California Hospital, Parnassus and 3d Ave., San Francisco 22, Calif.
Dr. J. Maxwell Chamberlain (*N.S.* 1934 & *W.S.* 1937), 23 E. 79th St., New York 21, N.Y.
Dr. Lincoln D. Clark (*M.* 1948), University of Utah, Salt Lake City, Utah
Dr. Beverly W. Cobbs, Jr. (*M.* 1953), Postgraduate Hospital, Ducane Rd., London W. 12, England
Dr. Herschel D. Collins (*M.* 1953), 8 N. Main St., Caribou, Maine
Dr. Leslie Corsa, Jr. (a. *C.M.* 1954), 2151 Berkeley Way, Berkeley 4, Calif.
Dr. Genesio L. D'Alessandro (a.r.p. *An.* 1950), 275 Forest Ave., Glen Ridge, N.J.
Dr. Thomas L. DeLorme (sr. r.s. *Or.* 1955), 234 Marlborough St., Boston, Mass.
Dr. Daniel D. Federman (*M.* 1954), National Institutes of Health, Bethesda, Md.
Dr. Howard S. Frazier (*M.* 1954), Biophysical Laboratory, Harvard Medical School, 25 Shattuck St., Boston, Mass.
Dr. Frank W. Garran, Jr. (*S.* 1951), Barnstable, Mass.
Dr. Philip S. Gordon (*Dn.* 1955), 277 Williams St., West Haven 16, Conn.
Dr. Adolf L. Gundersen (*S.* 1950), 218 S. 14th St., La Crosse, Wis.
Capt. Arthur Haut, MC, USAF (*M.* 1950), Box 323, 10th Field Hospital, APO 800, c/o Postmaster, New York, N.Y.
Dr. Samuel L. Katz (a.r.p. *C.M.* 1955), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Dr. Robert L. Kirkpatrick (a.r.s. Apr.-June 1955), Cleveland City Hospital, Cleveland, Ohio
Dr. Arthur R. Kravitz (*M.* 1955), Boston Psychopathic Hospital, 74 Fenwood Rd., Boston, Mass.
Dr. William G. Kuhn, Jr. (a.r.s. *Or.* 1949), 251 Powers St., New Brunswick, N.J.
Dr. Cornelius Lansing (*C.M.* 1948), University of North Carolina, Chapel Hill, N.C.
Dr. Alexander Leaf (*M.* 1944), Department of Biochemistry, Oxford University, Oxford, England
Dr. Robert W. Mackie (sr. r.s. *N.S.* 1954), U.S. Navy Medical Centre, Bethesda, Md.
Dr. Daniel F. Milam, Jr. (*S.* 1949), Massachusetts Eye and Ear Infirmary, Charles St., Boston, Mass.
Dr. Jule P. Miller, Jr. (a.r.p. *Psychiat.* 1955), Boston Psychopathic Hospital, 74 Fenwood Rd., Boston, Mass.
Dr. Gisela A. Munzinger (clin. fel. *Psychiat.* 1955), Child Psychiatry Division, Cincinnati General Hospital, Cincinnati 29, Ohio
Dr. William R. Owen (*M.* 1950), 1007 Hermann Professional Bldg., Houston 25, Tex.
Dr. Norman L. Paul (clin. fel. *N.*), 51 Brattle St., Cambridge, Mass.
Dr. Thomas C. Peebles (*C.M.* 1952), 100 Summer St., Weston, Mass.
Dr. Joseph R. Petranek (*M.* 1954), Pondville Hospital, Walpole, Mass.
Dr. Murray Rabinowitz (a.r.p. 1955), 98-40 64th Ave., Forest Hills, Long Island, N.Y.
Dr. John F. Radebaugh, Jr. (*C.M.* 1954), 81 Parkview Ave., Bangor, Maine
Dr. Jane S. Rasmussen (*C.M.* 1954), University College Hospital, London, England
Dr. Harvey D. Rothberg, Jr. (*M.* 1954), 831 Central Ave., Plainfield, N.J.
Dr. Jack H. Rubinstein (*C.M.* 1954), Children's Hospital, Cincinnati, Ohio
Dr. Arnold D. Schwartz (clin. & res. fel. *Psychiat.* 1955), Harvard School of Public Health, 55 Shattuck St., Boston, Mass.
Dr. David B. Sheldon (*S.* 1951), University of California Medical Center, Los Angeles 24, Calif.
Dr. Raymond D. Sphire (a.r.p. *An.* 1955), 1110 N. Renaud Rd., Grosse Point Woods, Mich.
Dr. Richard P. Stetson (*W.M.* 1928), 203 Commonwealth Ave., Boston, Mass.
Dr. Bernard B. Stone (r.s. *N.S.* 1955), 15 Hatfield Rd., West Newton, Mass.
Dr. Brian D. Stringer (gr. stud. a. *S.* 1955), 2 Yaldhurst Rd., Christchurch, New Zealand
Dr. Julio Toriello (r.p. *R.* 1955), 4a Calle 6-35, Zone 1, Guatemala City, Guatemala, Central America
Dr. Felix S. Vecchione (clin. fel. *Psychiat.* 1955), Veterans Administration Hospital, Northampton, Mass.
Dr. Mackenzie Walser (*M.* 1949), National Heart Institute, National Institutes of Health, Bethesda, Md.
Dr. Oscar B. Williams, Jr. (a.r.p. *An.* 1955), Parkland Memorial Hospital, Dallas, Tex.
Dr. W. Steve Worthy (clin. a. *Gyn.* 1951), 523 S. Tanner St., Carrollton, Ga.
Dr. Setrag A. Zacarian (r.p. *D.* 1955), 130 Maple St., Springfield, Mass.

* * *

Brief bits:—

Dr. Allan M. Butler was elected President of the American Pediatric Society at their annual meeting in Quebec on June 15.

Dr. Milton H. Clifford addressed the Fifth International Congress of Life Insurance Medicine at Aix-les-Bains, France, in June. His subject was "Subtotal gastrectomy for benign ulcers of the stomach and duodenum considered on a long-term basis".

Dr. James M. Davis (*S.* 1948) is now associated with Dr. Ashbel C. Williams in the practice of General and Thoracic Surgery in Jacksonville, Florida. His office address is 2720 Park Street.

Dr. Chester M. Jones will serve as Chairman of the American Board of Internal Medicine for the year 1955-56.

Dr. Robert R. Linton delivered an address on February 25 before the Vienna Surgical and Medical Society in Vienna, Austria. His subject was "Blood vessel grafting procedures". On March 11, he spoke at St. Thomas's Hospital in London on "The surgery of portal hypertension". On June 5 he delivered the Presidential Address before the Society for Vascular Surgery at Atlantic City. His subject was "Some practical considerations in blood vessel grafting procedures". On June 8 he addressed the Surgical Section of the American Medical Association meeting in Atlantic City on "Emergency and definitive treatment of bleeding esophageal varices".

Dr. Talmage W. Nielsen (*S.* 1949) has opened an office for the practice of Surgery in Salt Lake City, Utah. His office address is Suite 24, Professional Building, 60 South 4th East.

Dr. John W. Smillie (*E.S.* 1944) gave a paper on "Cataract surgery in megalocornea" before the Section on Ophthalmology at the American Medical Association meeting in Atlantic City in June. The discussion was opened by Dr. Derrick T. Vail (*Oph.* 1924), recently Chairman of the American Board of Ophthalmology.

Dr. Claude E. Welch was the guest speaker at the annual meeting of the California State Medical Society, held in San Francisco last May. He spoke on "Various aspects of gastro-intestinal surgery". Among others on the program were Drs. James A. Halsted (W.M. 1932) and Dr. Roy B. Cohn (*Path.* 1933 and *E.S.* 1936). Dr. Welch was also the speaker at the annual meeting of the Central New York Surgical Society, held in Syracuse on May 26.

No. 149 Boston, Mass. October 1955

CARDIAC LABORATORY AND CLINICS ✓

The time has come, according to THE NEWS, for another report from the Cardiac Laboratory and its appendages. Perhaps this is now appropriate, as five years have elapsed since our earlier note and another milestone has been attained in the affairs of the laboratory. In these five years conditions at the Hospital have changed to such an extent that the existing facilities in all the clinical laboratories have been stretched beyond their limits to keep abreast of routine demands and to participate fully in the accelerated programs of research. In particular, the sharp increase in bed occupancy by older age groups and the expanding requirements of the Ambulatory Clinics and, to a limited extent, of the Massachusetts General Staff Associates are reflected directly in the mounting requests for electrocardiograms and for the related services provided by the cardiac unit. This has now reached a near-critical stage, and the Hospital administration has come to our aid with plans for additional space and new equipment. In fact, construction has actually started on a new annex across the corridor from our present site, which promises to lessen the crowding and confusion in the main laboratory during the peak hours. These new quarters will include such welcome refinements as electric dryers, exhaust fans, and air conditioners.

On the threshold of these new developments, it may be of interest to recall the early days and duties of the laboratory, as well as to report on the activities of those currently responsible not only for the laboratory but also for the various research programs under way in cardiovascular disease elsewhere in the Hospital.

First, in regard to its origin more than forty years ago, certain excerpts from an address by one who was there are pertinent. On the occasion of the Ether Day anniversary in 1936, Dr. Paul D. White spoke on "The study and treatment of heart disease at the Massachusetts General Hospital from 1821 to 1936". His address was published in the *New England Journal of Medicine* for December 31, 1936. In commenting upon the founding of the laboratory he reported as follows:

> . . . In 1913 two events occurred, which inaugurated the new cardiac program that has followed. Mr. Skinner, a patient of Dr. William H. Smith's, through him offered to aid the progress of medical science at the Massachusetts General Hospital, and it was decided to install in the hospital one of the new string galvanometers called electrocardiographs. This instrument, a delicate apparatus, which registers the electrical activity of the heart muscle, was in those days viewed with suspicion by most of the doctors that had ever heard of it. It was regarded as little better than the clumsy old mechanical pulse tracing machine called the sphygmograph, which by the way was asked for in 1882 by Dr. Samuel Abbot whose request was referred to the Chairman of the Trustees and which apparently was not heard of again until Dr. Joseph Pratt years later, about 1910, brought in his own Mackenzie ink polygraph to use in the Outpatient Department.
>
> The other event was the coincidence of the date of my own graduation as interne and the date of the despatch by the new chief of the Medical Service, Dr. David Edsall, of some young doctor to London to study hearts and electrocardiography for a year and to bring back from Cambridge, England, an Einthoven string galvanometer. This instrument we installed at the hospital in the fall of 1914, in the only empty space, namely the basement of the skin ward. We built ourselves modest quarters adjoining the bathroom used by luetic patients, and here our heart work had its headquarters during the next few years until the demands of increased space carried us upstairs to the old apothecary shop on the ground floor of the Bulfinch Building under the stone steps just to the left of the central entrance door. One other move was made in 1925 to still more ample quarters, where we are now, in the new medical ell at the east end of the Bulfinch Building. To procure these ample quarters we were obliged to return again to the basement. . . .
>
> The old electrocardiograph did yeoman's service indeed. In seventeen years it wrote 21,160 electrocardiograms and helped to demonstrate that it and all its brothers, sisters and descendants were not useless toys, but were vital additions to clinical medicine in the proper understanding of heart disease. In 1931 it was relegated to the attic and we installed a new two-string galvanometer, which has written 17,118 more electrocardiograms in the past five years. . . .

This account of the early days and subsequent development of the laboratory by Dr. White is lacking in certain important and personal details — it does not, and obviously could not, fully reflect the profound and inspiring influence he himself has exerted upon his associates and fellow workers over the years, or indicate the scope of his boundless energy and enthusiasm, which fortunately he continues to share so generously with his colleagues and successors, even though the pressure of other duties forced him to relinquish the laboratory in 1949.

In the decade before World War II the demands upon the laboratory and the widening activities of its workers rapidly outgrew those "ample quarters" in the Bulfinch basement so proudly mentioned by Dr. White in 1936. Thus, with the rearrangement of the medical laboratories in 1939 the cardiac unit was moved above ground to its present central location, and now again, after another fifteen years, circumstances compel a further change, fortunately this time not a move but a welcome and necessary expansion.

The 100,000th electrocardiogram was recorded by the laboratory on September 3, 1947, thirty-three years after the founding of the unit, and the event was appropriately celebrated at that time. Now, eight years later, we are nearly two-thirds along on the second 100,000 (63,000 tracings). This sharp increment is indicated in the following table:

Electrocardiograms at the M.G.H.

Year	Wards	Private service	Total
1940 (4 leads)	3,110	2,408	5,518
1949 (12 leads)	3,691	2,318	6,009
1954 "	6,691	3,220	9,911
1955* "	7,988	3,616	11,604

Technicians	
1940	3
1949	6
1954	7
1955	8

* on basis of first six months

In 1949 the number of leads taken routinely was increased from 4 to 12, and the actual number of tracings has doubled in the past five years. Thus, on an average day the laboratory takes from 35 to 45 tracings, and not infrequently as many as 60 are recorded. Under the present system these are developed, processed, interpreted, and a report is made available on the wards or floors by 6 P.M. the day the tracing is made. To maintain this schedule requires a high degree of efficiency from equipment, full cooperation of ward and messenger services, and above all a busy day, often with extra hours, on the part of the technicians. Thus, to them especially, the new laboratory will afford a welcome respite from the crowded quarters of recent years.

So much for the routine service rendered by the laboratory. In addition, it has become over the years a focal point for clinical research by a considerable number of staff members, to an extent that this group and their activities are now being referred to informally as the Cardiac Unit. In any event, these men, fifteen in number, maintain active programs of research and teaching on the general service, in the special cardiac clinics, and in clinical conferences conducted five days a week with a senior member of the group serving in rotation as the chief for the week. In this fashion it has been possible to organize and conduct a long-term teaching program under the auspices of the Harvard Medical School Courses for Graduates, whereby twelve physicians can be accepted each year for a twelve-months' course. These contacts with young physicians from other sections of this country, and especially from far countries, have inspired us and, we hope, instructed them. Since 1949, in addition to those members from the United States, we have had either long-term graduate students or research fellows from

Total	50

As in the past, our two cardiac "residents", supported usually by the National Heart Institute, spend an active twelve months with clinical cardiology and special research projects. These two positions attract a considerable number of applicants, and it is regrettable that each year so many able candidates have to be directed elsewhere to the rather limited number of similar positions available in cardiology in this country.

The senior members of our group continue their special interests in the ever-broadening field of cardiovascular disease. Dr. Howard Sprague has developed the new phonocardiographic laboratory in the Research Building to a high degree of efficiency, and with the technical aid of Mr. Maurice Rappaport, Chief Engineer, Electrophysiologic Research, of the Sanborn Company, and a succession of research fellows, is acquiring a formidable collection of sound and murmur recordings for a projected album. In the same laboratory, Dr. Maurice McGregor of Johannesburg, South Africa, has continued his earlier studies of ballistocardiography with an improved instrument designed by Mr. Rappaport; and Dr. Conger Williams, with the assistance of graduate students, is employing a new and supersensitive vectorcardiograph capable of amplifying for the first time P and T vectors to a sufficient size to permit analysis and study.

Elsewhere, in the research laboratory adjacent to the X-ray Department on White 2, donated by the late Mrs. Theodore Brown and named for Dr. White, the catheterization team continues an active program concerned with the physiology of the pulmonary circulation. This team is composed of Drs. Gordon Myers and Allan Friedlich of the cardiac group, and Gordon Scannell and Stanley Wyman of the Surgical and X-ray Departments, with the indispensable technical assistance of Miss Ann Murphy. An angiocardiograph of special design, newly acquired from Sweden by the X-ray Department for this laboratory, permits high speed photography up to 12 frames per second synchronously in 2 planes of the passage of radio-opaque material injected in the blood stream. This should prove useful not only in studying the circulation through the heart and lungs but also in other organs of the body.

The problems of blood pressure and testing of new methods and new agents in dealing with hypertension occupy the special interest of Drs. Robert Palmer, James Currens, and William Chapman.

Dr. Mandel Cohen continues his investigation of the genetics of cardiovascular disease, with special reference to rheumatic fever, employing the twin-method of approach. He has also assembled some interesting and important new data on the central nervous system aspects of Cheyne-Stokes respiration.

It is with regret that we have lost temporarily the services and association of Dr. Edwin O. Wheeler. He has been called to active military duty for a two-year period and assigned to the U.S. Public Health Service's hospital on Staten Island as Assistant Chief of the Medical Service. In the interim Dr. Bryan Williams has joined our group.

Beginning this year, the M.G.H. is participating in a new project at a national level to survey the current practices employed in cardiac rehabilitation throughout the country and to determine what further investigation or improvement in methods seems indicated. This broad program is supported by the National Heart Institute and is under the direction of Drs. Howard A. Rusk and Paul D. White. The main activities will be centered jointly at the Institute of Physical Medicine and Rehabilitation of New York University and at the Massachusetts General Hospital. Dr. Bryan Williams is a member of the central committee and is coordinating the M.G.H. participation in this program. After the national survey is completed, specific projects are planned locally to supplement and extend current practices.

In concluding this report, I would like to speak of the achievements of our surgical colleagues at the M.G.H. in the field of cardiovascular disease which have been remarkable — first, in the correction of congenital defects, later in the perfection and utilization of arterial grafts, and now in the alleviation of certain acquired valvular deformities. In the past five years approximately 200 patients with mitral stenosis have had surgical relief by commissurotomy, mostly by Dr. Gordon Scannell, and an accessory aortic valve (Hufnagel type) has been inserted by Dr. Richard H. Sweet in 6 patients with severe and disabling aortic regurgitation.

The long and intimate association of the cardiac group with the House of the Good Samaritan, where problems of valvular disease and rheumatic fever have been studied for so many years, places our unit in a rather favored position to advise and to profit from the new developments in this field. Dr. Sprague continues as Chief of Staff at the Good Samaritan, and five others of our group serve on the staff. A long-term study of the consequencies of rheumatic fever, started by the late Dr. T. Duckett Jones over a quarter of a century ago, has been carried forward without interruption here and at the Good Samaritan, and detailed data on the first 2,000 patients are nearing completion for another interim report. Many of these cases date back to the early twenties, and with the advent of chemotherapy, antibiotics, and hormones it is unlikely that a similar group can ever again be assembled. Therefore, this experience should provide a useful baseline for the future comparison of the preventive programs and the vigorous therapeutic procedures presently employed.

Finally, the interest and support of patients and friends and, in particular, the substantial and increasing aid in recent years from the Massachusetts and American Heart Associations and from the National Heart Institute have made possible the research programs of the past and promise succcess for those of the future.

Edward F. Bland, M.D.,
Physician

⁂

Dr. Fuller Albright was awarded the honorary degree of Doctor of Science at the Harvard Commencement in June. The text of the citation reads: "Brilliant investigator in the complex field of nutrition and metabolism; your keen mind and enormous courage are a credit to this University and to medicine."

The Board of Trustees, at their meeting on August 26, voted to appoint:

Dr. Gardner F. Fay as Assistant Resident in Orthopedic Surgery, beginning July 1, 1956;

Dr. Robert P. Fornshell as Assistant Resident in Orthopedic Surgery, beginning April 1, 1956;

Dr. Garfield G. Kennedy as Acting Assistant Resident in Surgery, for the period December 1, 1955 through February 29, 1956;

Donald C. Klein, Ph.D. as Associate Psychologist, beginning September 1;

Dr. Thomas C. Peebles as Assistant to the Children's Medical Service, effective as of July 1;

Dr. J. Russell Smith as Acting Assistant Resident in Surgery, for the period September 1 through November 30;

Dr. Toivo H. Suutarinen as Assistant Resident in Anesthesia, beginning September 15;

Dr. Douglas O. Tompkins as Assistant Resident in Orthopedic Surgery, beginning July 1, 1956.

At their meeting on August 24, the General Executive Committee voted:

To reappoint:

Dr. William H. Batchelor as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Roger A. Melick as Clinical and Research Fellow in Medicine for one year, beginning September 15;

Dr. Robert L. Nielsen as Clinical and Research Fellow in Medicine for one year, beginning September 13;

Mr. Richard R. Peebles as Research Fellow in Psychology for one year, beginning September 1.

To appoint:

Dr. Paul L. Dunstan as Clinical Assistant in Psychiatry, beginning September 1;

Mr. William E. Fitzgerald, Jr. as Research Fellow in Psychology, effective as of July 1;

Dr. Carlos B. Gonzales as Graduate Student

Assistant on the Orthopedic Service, for the period September 6 through December 5;

Dr. Kiyokazu J. Momose as Clinical Fellow in Radiology for one year, beginning January 1, 1956;

Dr. Dean LaR. Moyer as Clinical Fellow in Pathology for one year, effective as of July 1;

Mr. Thomas F. A. Plaut as Research Fellow in Psychology, beginning September 1;

Dr. Betty S. Roof as Clinical and Research Fellow in Medicine for one year, beginning July 18;

Dr. John L. Rowbotham as Clinical Assistant in Surgery, with the privilege of caring for the patients of Dr. Leland S. McKittrick in Baker Memorial and Phillips House, effective as of August 1.

The General Executive Committee also voted:

That the appointment of Dr. David R. Bowsher as Clinical and Research Fellow in Neurosurgery be extended through November 30;

That the appointment of Dr. Spyros G. Macris as Clinical and Research Fellow in Anesthesia shall begin January 1, 1956 rather than July 1, 1955;

That the title of Dr. Edward S. Rendall be changed from that of Clinical Fellow in Medicine to that of Clinical Assistant in Medicine, effective as of August 1.

⁂

Mr. Joseph Hill has been appointed Director of Purchases at the Massachusetts General Hospital. He assumed his new duties on August 16. Mr. Hill was formerly Purchasing Agent at the New England Hospital, Roxbury, and prior to that was Procurement Officer with the United Nations Relief and Rehabilitation Administration.

⁂

Dr. and Mrs. Claude E. Welch returned recently from an extensive tour of the Middle East and have sent in the following interesting account of their travels:

The American University of Beirut, Lebanon ("AUB" as it is known throughout this part of the world) has, for the past five years, sponsored an annual Middle East Medical Assembly, with speakers invited from the U.S.A. and Great Britain. Since the AUB shines like a great Star of the East over the whole intellectual, as well as the medical, life of these lands between Egypt and Turkey, an invitation to speak at this meeting was practically a command.

The Assembly was under the direction of Dr. John L. Wilson (*E.S.* 1940). Dr. Wilson is now the Professor of Surgery in AUB, a post he has held for the past year. He has a floor of operating rooms as modern as any here in the United States, and holds a position of outstanding importance. It was comforting to find John still the same great efficient man he was years ago, though hard teaching and operative schedules, plus three very active young boys, have thinned him down from his MGH days.

Coincidentally, the Department of State requested further lectures in other cities, so Dr. ~~Carl~~ Watson of the University of Minnesota and Mrs. Welch and I made a rapid tour of several neighboring countries.

cil
istake
in Dr. Welch's copy sent to me.
Correction in note from Dr. Watson. (C.F.H.)

Everywhere we went there were appreciative words for our predecessors on these teaching tours — Drs. Churchill, Simeone, and DeBakey—and for the aid that was being given by the United States, particularly through Point 4. The assistance was especially striking in Amman, where numerous new hospitals and a magnificently equipped laboratory are opening. It is a tremendous problem to educate the profession to the point where full use is made of these completely modern facilities. Personnel problems are acute, for pay is not high, and America, as a land of promise, tends to siphon off many of the most promising men.

Most of our activities were centered in Beirut. This is a large city, where culture of both East and West meet freely and live in harmony. A huge modern airport means that most travelers to the Middle East pass through here. With the snow-covered Lebanon range immediately behind and the deep blue Mediterranean at its feet, the city has great natural charm. Like their Phoenician ancestors, the Lebanese are great traders and are attracting many new citizens to their major city, which is rapidly becoming the most important in the Middle East.

Jordan, on the other hand, is poorly endowed by nature, and, after the partition of Palestine, was left with very little arable land.

In Jerusalem, which is sadly divided by its barbed wire fence and sentries who shoot to kill, modern sanitation seems to have a nearly impossible task to perform. There, as in other parts of the country, lack of water, a heavily concentrated urban population, and the completely haphazard sanitary habits of the natives make intestinal infections very common. Though Amman, the capital, has no sewerage system, the first one in the country has just been installed by the Americans in Salt, a city of about 12,000.

Syria has two major cities, Damascus and Aleppo, and a good share of the lands of the Fertile Crescent. Heretofore, medical care has been centered in a few private hospitals that, in common with nearly all in this section, are filled almost entirely with surgical cases. Tuberculosis (particularly of the spine), duodenal ulcer, and the complications of gallstones are the most common diseases encountered. Cancer of the colon or rectum is infrequent and nearly always incurable by the time the patient accepts surgery. Unfortunately, Damascus — a beautiful and exotic city—has, in the guise of nationalism, introduced Arabic as the only language, even in the medical schools. This alone has created a serious backward step; combined with professional jealousy, lack of laboratory facilities, and few autopsies, the practice of medicine is at a low ebb.

One of the most interesting trips was that which we made to Aleppo, the thriving metropolis of Northern Syria. Here we found that the American colony numbered four families, and that only one or two Americans appeared here each month. However, we were immediately carried back to the Massachusetts General Hospital, for Dr. Semir Bashour (gr. stud. a. *M.* 1953) is the new Director of Health. He was naturally immensely proud of his new cardiac laboratory, and everywhere were mementos of Dr. Paul D. White, the M.G.H. and Harvard. He is starting a robust health program essentially from scratch. He pointed out that one of his five hospitals is a remodeled prison — a feature he can accept with equanimity since Charles Street jail is allowed to flourish so near the M.G.H.

Here, as elsewhere, are found private hospitals, run either by very able individuals or by missions, all doing a very capable job. Those of Drs. Altoumyian in Aleppo, Dajani in Bethlehem, and Nachmann in Damascus were models of cleanliness and efficiency. The Danish Mission Hospital in Nebk, a small Syrian town, handles a surprisingly large number of surgical patients and is nearly independent of outside resources. Thus, the surgeons not only do all of their x-ray work and pathology, but they supervise the manufacture of morphine and even aspirin tablets.

The last important city we visited was Baghdad. Here the new-found wealth of Iraq is being used to develop many new projects of flood control and irrigation. A huge new medical school and laboratory is planned, and construction on it will begin soon.

A recent development that requires special emphasis is the opening of new schools of nursing. There has been strong prejudice against the education of Mohammedan women as nurses. However, native girls are being gradually attracted to the profession. Most of the private hospitals are educating a few nurses. In Amman, a new school of nursing has been established by Dr. Orris Chapman, the administrator of Point 4, and his able assistant, Miss Hillman. They now have 21 girls enrolled, and a new modern building has just been erected that could house 60.

The greatest problem in the Middle East is that of Palestine. An estimated 900,000 Arab refugees from the area, now in Israel, are still living in tents, in unbelievable desolation, on less than subsistence rations. This poses nearly incalculable difficulties in adequate medical care. For example it was a disheartening sight to enter a ward holding perhaps 60 children and find it absolutely quiet. Nearly all of these little patients were victims of malnutrition, with severe weight loss or edema. They would be relieved, only to return a few months later in the same condition.

Perhaps we could accept this situation with less equanimity than these people do, who have with them everywhere the evidence of rise and fall of civilization after civilization. However, discontent is rife and unless it is settled by implementation of the United Nations resolutions, starvation or a major disaster seems inevitable.

Meanwhile, it is heartening to see evidences of purposeful activity everywhere. The people are shaking off their physical and intellectual lethargy. New cars and traffic jams are as frequent in Baghdad as in Boston. The younger generation is greatly interested in America, and, with few exceptions, is being oriented toward the English-speaking countries. We are acquiring many responsibilities that will demand a great deal from American medicine.

* * *

CHAPLAIN TRAINEES AT M.G.H.

The second 1955 session of the Institute of Pastoral Care attracted ministers from many parts of the country to the training center here at the Massachusetts General Hospital. Rev. James H. Burns, our Protestant Chaplain, is also Executive Secretary of the Institute and Director of our Clinical Pastoral Training Program. He reports that twelve clergymen from Massachusetts to California and from Tennessee to Wisconsin took the second semester of the training course this year, and served as his assistants here in the Hospital.

The Institute attracts men not only from our own nearby and far-flung States, but also clergymen from other countries, and we thought you might be interested in knowing about the backgrounds of just a few of the men who were here with us this year.

Rev. William W. Baldwin is Priest-in-Charge of St. Andrews Episcopal Church in Cocoli, Canal Zone. Mr. Baldwin has a most interesting and varied background. He was born in Patchogue, Long Island, and received his early education there and at the Islip High School. At 16 he became a carpenter apprentice and worked in various jobs in the New York vicinity, later becoming a journeyman carpenter. He went west at the age of 21 and had considerable experience in business, salesmanship, and ranching in California and Nevada, returning to New York at the height of the depression. In 1934 he went on a job to Aruba, Dutch West Indies, and in 1937 returned to New York and operated a woodworking shop for several months. Later in 1937 he went to Maracaibo, Venezuela, as field superintendent and contractor for the Venezuelan Oil Concessions. He returned to the States in 1939, married, and while in New York he trained for flying at Roosevelt Air School. When, to his disappointment, he found he was one year too old for acceptance in the Army Air Force, he went to the Panama Canal Zone in 1940 and worked there for 9 years as carpenter foreman and operator. Through a series of circumstances, including the loss of a child at birth and a feeling of the need for a real purpose in life, he became interested in the Church and started attending services at St. Andrews in Cocoli. This led through a series of steps to confirmation, service as vestryman, lay-reader, and finally to his decision to study for the priesthood of the Episcopal Church. He was thereafter ordained Deacon of the Church in 1951, and Priest in 1952. Two months after his ordination to the priesthood, the church which he had first attended needed a clergyman, and the Bishop sent him to be Priest-in-Charge of St. Andrews. He has 2 children.

Rev. Robert P. Price, a Californian, is here in Boston taking graduate study at Boston University School of Theology. Mr. Price, his wife, and son are in residence at 207 Bay State Road. He is on leave of absence from his duties as Associate Minister, St. Paul's Methodist Church, San Bernardino, California. He has been serving the Methodist Church in Arizona and California for some 15 years, though he is a native of Martinsville, Virginia. He says his interest in clinical pastoral training has grown out of his experience in working with small groups of young adults, and from the realization that this training is very important in dealing with the myriad situations which affect the various individuals whom he is called to serve.

Denominations were almost as varied in their representation here in clinical pastoral training this year as were the States from which our trainees came. In addition to California and the Panama Canal Zone, States represented included Massachusetts, Rhode Island, Tennessee, Virginia, Pennsylvania, and Wisconsin.

From Wisconsin and the Norwegian Synod of the American Evangelical Lutheran Church came Rev. Adolph M. Harstad. He was born in the State of Washington in 1902, the son of Rev. and Mrs. B. Harstad. After finishing high school in Tacoma, Washington, he taught school for a year. He graduated from Concordia Junior College in St. Paul, Minnesota, and Concordia Theological Seminary in St. Louis, Missouri. After serving pastorates at Thornton, Iowa, Madison, Wisconsin, and Princeton, Minnesota, he became Chaplain at Bethesda Lutheran Home, Watertown, Wisconsin, in July 1953, which position he holds at present. Mr. Harstad had the distinction of being head of the largest "family" in the training group. In addition to the 440 patients at the Home where he ministers, he also has a wife and 10 children of his own. The real impetus for this training course came, quite naturally, from the day-to-day work which he does as a part of his job as Chaplain of the Home.

In the group this year were local clergymen — five in number from Massachusetts. They were Rev. Virgil V. Brallier, Pastor of the Maplewood Congregational Church in Malden, Rev. Theodore C. Hamlin, Pastor of the Congregational Church in Lakeville, Rev. Bertil E. Hult, Pastor of the Augustana Lutheran Church of Quincy, Rev. Russell B. Richardson, Pastor of the Second Congregational Church of Attleboro, and Rev. Douglas M. MacIntosh, Pastor of the Central Congregational Church of Jamaica Plain.

The only Massachusetts-born man in this group was Mr. Richardson, who was born March 8, 1905, in Reading. He received his schooling in Reading and at Mount Hermon Preparatory School. He graduated from Gordon College, Boston, and from Yale Divinity School in 1931. He is the father of 3 children. Before ordination, he was a student worker, serving as Registrar for the Student Volunteer Movement Convention of 1931 and later as traveling secretary. He was ordained in his own home church in Reading in 1931, and served the following pastorates: North Congregational Church, Woburn, from 1932 to 1935; South Congregational Church, Pittsfield, from 1936 to 1942. When the war came he entered the Army, serving for 3½ years as a Chaplain with the United States Army in the European Theatre and in Texas. Upon his return from military duty he accepted the pastorate of the Second Congregational Church of Attleboro, where he is currently serving. His interest in clinical pastoral training grew out of a lecture course on psychiatry which he attended at Yale. While at Pittsfield he served on the Board of Directors of the Riggs Psychiatric Clinic. A need for clinical pastoral training was also felt during his period of duty as an Army Chaplain. Mr. Richardson is at present Vice-President of the Attleboro Mental Health Clinic, which he helped establish, a member of the Hospital Association Board and the Board of Trustees of the Massachusetts Conference of the Congregational Christian Church, and Moderator of the local Attleboro Association.

Others taking training and serving as Assistant Protestant Chaplains were: George E. Sinkinson, Jr., Middler at the Episcopal Theological Seminary at Cambridge, Massachusetts; Rev. Charles Edwards, Pastor of the Baptist Church at Callao, Virginia; Rev. Roy E. Williams, Ph.D., Pastor of the Firwood Methodist Church of Wilkes-Barre, Pennsylvania; and Rev. Pitser M. Lyons, III, Pastor of the Colonial Heights Presbyterian Church of Kingsport, Tennessee.

* * *

Brief bit:—

Dr. Edward B. Benedict attended the meeting of the American Gastroscopic Society in Atlantic City on June 2, and discussed the following papers: "The techniques of gastric biopsy", by Dr. C. Wilmer Wirts, and "The major contributions of the gastric biopsy", by Dr. Paul Shallenberger. On June 3, Dr. Benedict attended the meeting of the American Gastroenterological Association, and discussed the paper "Peptic esophagitis and peptic ulceration of the esophagus", by Drs. Bernard S. Wolf, Richard H. Marshak, Max Som, and Asher Winkelstein. On June 7, Dr. Benedict attended the meeting of the American Medical Association, Section on Gastroenterology and Proctology, and discussed the following papers: "Hiatus hernia and related disorders of the esophagogastric junction", by Drs. E. Clinton Texter, Jr., Hubbard W. Smith, and Clifford J. Barborka; "Regurgitant esophagitis", by Dr. Herbert W. Schmidt; and "Esophagitis, hiatal hernia, and cardiospasm: Surgical considerations", by Dr. David B. Boyd.

MASSACHUSETTS
EYE & EAR INFIRMARY

CLINIC FOR SUBNORMAL VISION

During the past ten years the Refraction Department of the Massachusetts Eye and Ear Infirmary has been slowly developing its clinical program on subnormal vision. Work has been done in a very small way, with a certain group of patients who have been "left out" in the general routine of eye care. This group is composed of those persons who are not totally blind and yet do not have vision serviceable for reading and seeing things precisely. They are industrially blind, yet see enough to get around and do most things for themselves. Ordinary glasses are of no help and therefore they have been discouraged by being told that nothing could be done for them.

The Infirmary was one of the first hospitals in the country to include lectures in its curriculum on the use of special devices for this group of patients. The director of the Refraction Department, Dr. Albert E. Sloane, has been giving courses in this field for three years as part of the teaching section of the American Academy of Ophthalmology, and has been fortunate in having a close liaison with agencies for the blind. Mrs. Helen F. Kirwin (recently retired) of the Social Service Department was one of the pioneers in this work and dedicated herself to its progress.

A gift of $3,000 from the Boston Aid to the Blind now makes it possible to enlarge and equip the existing facilities for work in subnormal vision. The new area will have special equipment for refracting such patients, in addition to regular equipment for the usual refraction. This area will be used in the ordinary routine whenever needed, as well as for a separate room with subnormal vision devices. The Boston Aid to the Blind has dedicated itself to helping blind persons and is already well known to the Infirmary, having donated a sum of money last year for the equipping of a laboratory in the new Research Center.

Under the supervision of Dr. Sloane, such patients will now be referred to the clinic, where there will be many more special testing facilities. All of the newest instruments and techniques will be available for patient care. The clinic will also have access to the research facilities of the principal universities in the community and those throughout the United States. Cooperative agreements have been made with other leading medical centers and with the American Foundation for the Blind, so that new discoveries will be immediately available to those interested in the field.

The clinic will also undertake to spread its experience and teaching to all postgraduate groups, thereby increasing even further its main function—service to the patient. To be of utmost value, the work will proceed slowly and cautiously, and the research that is done will be correlated with that of other groups. All of the facilities will be available to staff members, so that they may do their own testing. Such devices as telescopic and microscopic lenses will be available in the clinic, as well as all of the other new developments and equipment in this field.

The new clinic will be a scientific testing ground for all phases of subnormal vision. We trust that this new service will eliminate false hopes which have arisen among certain patients in the past through distorted reports that so frequently appear in the press.

A visitor to the Infirmary for three weeks was Dr. Edwin G. Gut, from the University Eye Clinic in Basel, Switzerland. Dr. Gut was particularly interested in the newest surgical techniques in ophthalmology, tonographic methods, the new ophthalmoscope, and the stereoscopic camera. He hopes to make use of these new advances when he returns to Switzerland.

The Glaucoma Consultation Service, under the direction of Dr. Robert R. Trotter, now has a new location in what has been the out-patient operating room. This will make the glaucoma diagnostic procedures available to more clinic patients than has previously been possible. Dr. Baruch Sachs is the first house officer to start a three-month rotation on the new service.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K., and Ford, C.
Anesthesia: Fifty years of progress.
Surg., Gynec. & Obst. 101:105-139.

Beecher, H. K., and Todd, D. P.
Comment on the critique.
Ann. Surg. 142:142-144.

Otolaryngology

Pressman, J. J., and Kelemen, G.
Physiology of the larynx.
Physiol. Rev. 35:506-554.

Sterility

Simmons, F. A., and Taymor, M. L.
Failure of conception in 100 completely studied couples: Analysis of factors in infertility.
Fertil. & Steril. 6:320-341.

BIOGLETS

Dr. Joseph Albert, Assistant Resident in Dermatology—born in Boston, Massachusetts, July 31, 1929; Boston Latin School, Class of 1946; Boston University, 1946-49; Harvard School of Dental Medicine, 1949-51; Research Fellow in Diabetes, Joslin Clinic, 1951; Research Fellow, House of the Good Samaritan, 1952; M.D., University of Vermont College of Medicine, 1954; Intern in Medicine, New England Center Hospital, 1954-55; single.

Dr. A. Robert Arnstein, Intern in Medicine—born in St. Louis, Missouri, September 20, 1930; attended Princeton University, Princeton, New Jersey; M.D., Washington University School of Medicine, St. Louis, 1955; home address: 11 Scarsdale Street, St. Louis 17, Missouri.

Dr. John H. Dwyer, Assistant Resident in Children's Medicine — born in Pittsburgh, Pennsylvania, October 18, 1926; U.S. Navy: Electronic Technician's Mate, 1945-46; B.S., Yale University, 1950; M.D., University of Pittsburgh Medical School, 1954; Intern, University of Pittsburgh Medical Center, 1954-55; married; one daughter.

Dr. Leonard J. Friedman, Intern in Medicine—born in New York City, August 14. 1930; A.B., Harvard College, 1951; M.D., Harvard Medical School, 1955; married; home: Boston, Massachusetts.

Dr. A. Erik Gundersen, Intern in Surgery—born in LaCrosse, Wisconsin, December 26, 1930; Lake Forest Academy, Lake Forest, Illinois, 1946-48; B.A., Dartmouth College, 1952; Dartmouth College Medical School, 1951-53; M.D., Harvard Medical School, 1955; married; one daughter; present address: 80 Pierce Road, Watertown, Massachusetts.

Dr. Wayne M. Hebertson, Assistant Resident in Neurology—born in Provo, Utah, February 19, 1926; B.S., Brigham Young University, Provo, Utah, 1949; M.D., College of Medicine, University of Utah, Salt Lake City, 1952; Intern and Assistant Resident in Medicine, Salt Lake General Hospital, Salt Lake City, 1952-55; military service: 1st

MEMBERS OF OUR GENERAL EXECUTIVE COMMITTEE
Seated: DR. LAURENCE L. ROBBINS, DR. WALTER BAUER, DR. EDWARD D. CHURCHILL, DR. W. FRANKLIN WOOD, DR. DEAN A. CLARK
Standing: DR. JOSEPH S. BARR, DR. ALFRED KRANES, DR. ERICH LINDEMANN, DR. BENJAMIN CASTLEMAN

Lieutenant of Infantry, 11th Airborne Division, Asiatic Pacific Theatre, 1944-46; single; permanent address: Route 1, Provo, Utah.

Dr. Kenneth E. Liffmann, Intern in Dentistry — born in Düsseldorf, Germany, April 14, 1929; A.B., Brown University, Providence, Rhode Island, 1951; D.M.D., Harvard School of Dental Medicine, 1955.

Dr. Ronald A. Malt, Intern in Surgery—born in Pittsburgh, Pennsylvania, November 12, 1931; A.B., Washington University, St. Louis, Missouri, 1951; M.D., Harvard Medical School, 1955; married; one son; temporary home: Watertown, Massachusetts.

Dr. John T. Monroe, Jr., Intern in Medicine—born in Trenton, North Carolina, January 27, 1929; B.S., Davidson College, Davidson, North Carolina, 1951; M.D., University of North Carolina, 1955; home: Fayetteville, North Carolina.

Dr. Edward C. Parkhurst, Assistant Resident in Urology—born in Beverly, Massachusetts, March 3, 1922; A.B., Amherst College, Amherst, Massachusetts, 1943; U.S. Navy: Non-Pilot Navigator Lieutenant, Pacific Theatre, 1943-46; M.D., University of Rochester, Rochester, N.Y., 1951; Rotating Intern, Rhode Island Hospital, Providence, Rhode Island, 1951-52; Resident in Surgery, Rhode Island Hospital, 1952-55; married; two children.

Dr. Russell E. Randall, Jr., Assistant Resident in Medicine—born in San Antonio, Texas, October 18, 1928; A.B., Princeton University, Princeton, New Jersey, 1949; M.D., Columbia University College of Physicians and Surgeons, New York City, 1953; Intern, King County Hospital, Seattle, Washington, 1953-54; military service: Captain, USAF, Flight Surgeon, stationed in Alabama, San Antonio, Texas, and Westover AFB, Westover, Massachusetts; will return to the Air Force for three years' residency in Internal Medicine; activities: football, tennis, captain for two years of varsity wrestling at Princeton, hunting, fishing, gardening (earned way through school by landscaping — Randall's "Handy-Andy" Service); married; two children.

Dr. Ellis L. Rolett, Intern in Medicine—born in New York City, July 10, 1930; B.S., Yale University, 1952; M.D., Harvard Medical School, 1955; home: White Plains, N.Y.

Dr. Farrokh Saidi, Assistant Resident in Surgery — born in Teheran, Iran, November 22, 1929; entered the United States in 1946; attended Cornell University, Ithaca, N.Y., for three years; M.D., Harvard Medical School, 1954; Intern in Medicine, Duke Hospital, 1954-55.

Dr. Allan I. Sandler, Intern in Medicine—born in New York City, June 17, 1930; A.B., Princeton University, Princeton, New Jersey, 1951; M.D., Harvard Medical School, 1955; single; home: Long Beach, N.Y.

Dr. Richard L. Sidman, Assistant Resident in Neurology — born in Boston, Massachusetts, September 19, 1928; B.A., Harvard College, 1948; M.D., Harvard Medical School, 1953; Intern, 4th Medical Service (Harvard), Boston City Hospital, 1953-54; Moseley Traveling Fellow from Harvard to Strangeways Research Laboratory, Cambridge, England, and the Department of Anatomy, Oxford, England, 1954-55; married; home: Boston, Massachusetts.

Dr. Sumner I. Zacks, Intern in Pathology—born in Boston, Massachusetts, June 29, 1929; A.B., Harvard College, 1951; M.D., Harvard Medical School, 1955; home: Brighton, Massachusetts.

New addresses:—

Dr. Robert J. Brockhurst (*M.* 1948), 327 Charles St., Boston, Mass.
Dr. Herschel A. Graves, Jr. (clin. fel. *S.* 1955), 602 Doctors Bldg., Nashville, Tenn.
Dr. Thomas H. Green, Jr. (*W.S.* 1947), 226 Marlborough St., Boston, Mass.
Lowell P. Hager, Ph.D. (a. biochem. *Res. Chem.* 1955), Department of Chemistry, Harvard University, Cambridge, Mass.
Dr. Gudrun Helm (fel. *An.* 1955), Malmö Allmänna Sjuklms, Malmö, Sweden
Dr. Henry L. Heyl (r.s. *N.S.* 1940), Hitchcock Foundation, Hanover, N. H.
Dr. Betsy A. Ledbetter (a.r.p. *An.* 1955), 401 Flint St., Jonesboro, Ark.
Dr. Joe V. Meigs (*E.S.* 1921), 226 Marlborough St., Boston, Mass.
Harris S. Moyed, Ph.D. (res. fel. *Biochem.* 1955), Department of Bacteriology, Harvard Medical School, Boston, Mass.
Dr. Henry Neiditsch (fel. *An.* 1955), 82 Missionsstrasse, Basel, Switzerland
Dr. Averum B. Organic (*M.* 1952), Navajo Medical Center Sanitarium, Fort Defiance, Ariz.
Dr. Oscar Swineford, Jr. (*W.M.* 1927), Box 3373, University Station, Charlottesville, Va.
Dr. W. Jones Williams (res. fel. *Path.* 1955), Institute of Pathology, Welsh National School of Medicine, Cardiff, Wales

We were delighted to receive this nice letter from Dr. Frank B. Norbury (*M.* 1949)—our MGH "singleton" in Jacksonville, Illinois. (For those newcomers to the Hospital who may not understand what we mean by "singleton"—we have conferred that title upon those doctors who are the only MGH-ers practising in their particular communities.) Dr. Norbury's letter reads:

> I was pleased to be asked to contribute information as the only "singleton" in Jacksonville.
>
> I have just completed my first year of practice in this community of about 25,000 people. Jacksonville is in central Illinois. It is the home of Illinois College and MacMurray College for Women. We also have the State School for the Deaf, State School for the Blind, and a State Psychiatric Hospital. Education is therefore a major local industry, along with farming.
>
> About half my time is devoted to the private practice of Internal Medicine in the community and half time is spent working in a private psychiatric hospital—the Norbury Sanatorium. This makes an interesting combination, and I believe psychiatric experience would be extremely valuable to anyone who intends to practise Internal Medicine in a small community. The physicians here have friendly and cordial relationships which make for a relaxed atmosphere in which to practise medicine. St. Louis, ninety miles away, is the nearest large medical center for more specialized medical care.
>
> My chief interest outside of medicine is my family, especially my year-old daughter who is a never-ending source of amazement and amusement.
>
> I have enjoyed receiving THE NEWS, and I hope we will have a chance to visit Boston in the near future.

This interesting letter has come from Dr. Stanley T. Soholt (sr.r.s. *Or.* 1951), including his new office address — 193 Arch Street, Redwood City, California. He writes:

> Although I am listed as a "singleton", as you put it, being the only MGH-er in Redwood City, I am hardly lacking for association with other MGH alumni. As you know, the migration of MGH grads to California, particularly to the San Francisco area, has been considerable. Even within ten miles of Redwood City we have a number of them: William Key, Gordon Morrison, John Ratcliffe, O. W. Hills, and Kirk Prindle in San Mateo, just north of here; and Ralph Hawkins and Joseph Tanner in Palo Alto just south of here.
>
> Upon leaving the old "MASSACHUSETTS" in 1951, I returned directly to the San Francisco Bay area and have been practising Orthopedics here in Redwood City since that time. Redwood City is a town of about thirty to forty thousand people and is about twenty-seven miles south of San Francisco, being one of a string of suburbs extending down the San Francisco peninsula. It is on the San Francisco Bay and protected from the ocean fog by a small range of mountains. To describe the climate of this area, even when understating the facts, is difficult to do and not sound like a member of the local chamber of commerce. Suffice it to say that we find it very pleasant.
>
> My practice here has been an enjoyable one, and the attitude and relationship of the other members of the profession seem to be a good deal more pleasant in general than is ordinarily encountered in a large city. We work in a new 200-bed hospital which is only five or six minutes away from my office or my home. So the combination of pleasant surroundings, pleasant colleagues, and convenient location of the office and hospital makes my work a great deal more leisurely and enjoyable.
>
> This whole area is growing fast and the number of MGH alumni is gradually increasing, so I don't feel I will be a "singleton" in Redwood City for long.

THE NEWS

No. 150 Boston, Mass. November 1955

THE POLIOMYELITIS STORY MASSACHUSETTS GENERAL HOSPITAL — 1955

The real story of the part played by five Boston hospitals in the 1955 poliomyelitis epidemic will be found in the experiences of the hundreds of men and women who worked closely and with selfless devotion in the polio wards of these hospitals. A few observations, however, from the point of view of a trustee who, with other members of the Board, had the great privilege of seeing the wards in full operation, may help to give completeness to the story.

As Chairman of the Board of Trustees of the Massachusetts General Hospital, it seems to me that the conversion of a large area in a general hospital to a self-contained "isolation hospital" has been one of the outstanding achievements of the Massachusetts General Hospital during its long history of service to the community.

Just as the Hospital rose to great heights at the time of the Cocoanut Grove disaster in 1942, so, thirteen years later, a "disaster" of an entirely different nature is being met in an equally outstanding manner. The impact of the 1955 polio epidemic came gradually upon the Hospital during the early summer months, then suddenly reached unprecedented proportions as the number of patients with the disease increased steadily beyond any previous experience in the Commonwealth.

From the standpoint of the M.G.H. the polio epidemic cannot truly be described as an emergency, for that would imply suddenness and brevity, though the element of suddenness has been a major factor all along the line, from the making of administrative decisions to the recruiting of personnel and the moving of equipment. Unlike an emergency, however, the polio situation in the Hospital has placed upon it a long-term responsibility, especially for those patients who were most seriously afflicted.

Our task is far from completed in relation to the more than 400 polio patients who, up to November 1, have been cared for in the Massachusetts General Hospital. Even at this writing, there are 119 patients still in the polio wards and 28 of them are in respirators. The Polio Clinic is in full operation, and many patients discharged from the Hospital will be seen here for months and months to come.

No layman could visit the polio wards and not be profoundly moved at the gallantry and fortitude of the patients themselves, nor fail to recognize the inspiring *esprit de corps* of those who minister to them. The Trustees acknowledge a debt of deep gratitude to those people from every department of the Hospital who, by their skill and devotion to duty, have made it possible once again for the Massachusetts General Hospital to fulfill its obligation to the community in a great emergency.

Francis C. Gray,
Chairman, Board of Trustees

A NOTE OF APPRECIATION

The management of the polio epidemic mainly shows, it seems to me, how effectively the Massachusetts General Hospital is able to act as a unit to meet an emergency situation. This has been demonstrated, in the first place, by the polio team formed among the Resident Staff, and by the magnificent joint effort of all departments of the Hospital to support the polio wards and keep the remainder of the Hospital running at the same time. This effort is described in detail in this special issue of THE NEWS.

This capacity for unity is also illustrated by the fact that, when it became necessary to open White 9 as the respirator center, the teaching services for Neurology and Neurosurgery were housed for many weeks in the Phillips House — the first time, I believe, that Phillips House has served in such a capacity.

At the same time, all respirator cases, including patients who ordinarily would have been identified as "Phillips House" or "Baker" patients, have been cared for together on White 9, and all adult paralytic cases (other than respirator), whether children or adults, whether "ward" or "private", have been admitted to a specially created isolation unit on Baker 8 and 6. To the best of my knowledge, not a single complaint, and indeed scarcely a comment, was heard about this unusual train of events.

The Hospital is grateful not only for the prompt and faithful assistance given by so many of our own personnel but also for the aid furnished by many individuals and organizations outside the Hospital. Among these are, especially, Dr. Benjamin G. Ferris of the Harvard School of Public Health and Consultant to the Massachusetts General Hospital, and Dr. Louis Weinstein of the Haynes Memorial unit of the Massachusetts Memorial Hospitals and Associate Physician to the Children's Medical Service of this Hospital, who have visited us regularly to advise on treatment procedures, particularly on the respirator floor. Beth Israel Hospital helped out with intravenous solutions when our supplies were running short, and the Mount Auburn Hospital and others furnished nurses at critical moments.

We owe, most of all, an enormous debt to the National Foundation for Infantile Paralysis for its contribution of respirators, nurses, a medical social worker, physical therapists, and very large financial assistance. We appreciate, too, the part played by the American Red Cross and its Motor Corps, District 5 of the Massachusetts State Nurses Association, and the several branches of the Armed Forces in recruiting nurses, corpsmen, and other personnel; the Harvard, Tufts, and Boston University Medical Schools in supplying medical students to serve in many capacities; and the First National Bank of Boston and the New England Telephone and Telegraph Company in furnishing nurses (at their expense).

The Boston newspapers and wire services have not only cooperated in telling the story of the work done by the five hospitals in Boston where polio patients have been cared for, but have also assisted in a very important way in making known to the public the needs of these hospitals, particularly with respect to recruitment. To these and all others who in any way assisted us in the emergency we offer deep and sincere appreciation.

Dean A. Clark, M.D.,
General Director

September 12, 1955

ADMINISTRATIVE LETTER

Dear Doctor:

M.G.H. has every year prepared itself to handle cases of poliomyelitis, usually in relatively small numbers, and has long conducted an excellent polio clinic for aftercare. This summer, however, it joined Children's Medical Center, Haynes Memorial, Boston Floating Hospital, and Boston City Hospital in caring for a staggering load of polio patients.

In the process of devoting all our people and resources, M.G.H. has been awe-inspiring to those of us who have been close enough to the situation to see one emergency problem after another solved. All the solutions simply involved more of our people, each continuously giving more and more to the task. You cannot imagine the personal devotion and ability to maintain maximum effort shown here this summer unless you were one of the staff involved.

Because of this heavy load of polio patients, all sections of the Hospital are under unusual stress. Many of the House Staff and all of the Nursing Service have pushed themselves to a state of emotional and physical fatigue. Part of the Anesthesia Service is spending full time in the care of respirator cases. The personnel of Laundry, Emergency Ward, Housekeeping, Maintenance, Central Supply, Physical Therapy, Laboratories, and Dietary

Departments are carrying a bigger load than at any other time in the history of the Hospital.

Phillips House has taken the Neurosurgical and Neuromedical Services patients. Baker 6 and Burnham 5 are exclusively polio floors. White 9, recently opened, holds the patients who are in acute respiratory distress. White 11 holds the patients in less acute respiratory distress. White 8 has patients undergoing rehabilitation. There is a scattering of convalescent polio patients throughout the Hospital.

The only way you can get an inkling of the efforts involved in the past is to visit White 9. It is a sudden education in the meaning of poliomyelitis, especially in the adult population. Almost everyone who has visited there has requested that others connected with the Hospital be invited to visit there briefly. The General Executive Committee would like to join in this invitation to each member of the Staff.

Sincerely yours,
(Signed) **E. T. Neumann, M.D.,**
Administrator

Because each department that participated in the polio emergency achieved greatness in its own particular way, with no first and no last in importance but each performing an indispensable role in the over-all endeavor, we have arranged the following accounts from the various services in alphabetical order.—*Editor*

ADMITTING OFFICE – STATISTICS

On July 5, 1955, the first polio patient was admitted to the General wards. From then until August 9 the average number of polio patients in the General Hospital, Baker Memorial, and Phillips House was 50. Beginning on August 9 the admissions increased in the three units to an average of 6 per day. The highest number of admissions in one day was 13 on August 16. Up to November 1 there had been 408 polio patients admitted — 81 bulbar type, 123 nonbulbar paralytic, and the balance nonparalytic. Of the total, 138 were children. More than 50 patients were in the respirator unit.

There were 19 fatal cases. Seven long-term respirator cases have been discharged to the Lemuel Shattuck Hospital, Jamaica Plain, and 2 to the Veterans Hospital. As of October 1, there were 121 polio patients in the Hospital, 33 of them being in respirators and Jefferson machines, and an average of 2 to 5 in rocking beds. These patients were on White 9, Baker Memorial 6, White 8, Burnham 5 (children), and White 5.

Helen M. Daly, R.N.,
Executive Assistant, General Hospital

ANESTHESIA DEPARTMENT

When the polio team was established this year, an assistant resident from the Anesthesia Department was assigned to the team because of the respiratory problems encountered in polio patients. This has proved of value, both to the patients and to the members of the Anesthesia Department. The opportunity for the anesthesia residents to familiarize themselves with the special problems the polio patients display is very valuable.

Ever since the first respirator patient was admitted to the Hospital there has been a member of the Anesthesia Department constantly on the respirator floor to help out with tracheotomies, bronchoscopies, and airway problems, as well as to give artificial respiration with an anesthesia machine during the periods when it was necessary to take the patients out of the iron lung respirators in order to perform the necessary patient care. During the first month one anesthesia resident alone handled most of the problems, with occasional assistance from other members of the Anesthesia Department. Later, as the number of patients increased and it became obvious that the work would go on for a considerable length of time, three assistant residents were assigned, full time, to the polio service in order that there might be continuous day and night coverage.

As the surgical schedule increased it became apparent that the Anesthesia Department would be unable to supply adequate service for the surgery, with three of its residents tied up at the polio service. It was therefore a great help that a surgical assistant resident who had previously rotated through the anesthesia service was assigned, from the middle of September, to the polio service, so that an anesthesia resident could be made available for regular anesthesia duty.

It should be mentioned that the anesthesia service has had the opportunity to institute and get experience with a respirator treatment which differs from the usual iron lung system. During the polio epidemic in Copenhagen in 1952 it was found that application of intermittent positive and negative pressure to the airway of the patient had certain advantages. Therefore a set-up, using a Jefferson Respirator, was tried and it proved to be very satisfactory. It provides a better ventilation of the patient, and since the patient is in his bed rather than in an iron lung, nursing care is greatly facilitated. The Jefferson Respirator is being used here at Massachusetts General Hospital on patients with major pulmonary complications and patients with bedsores. Up to five patients at a time have been on these respirators, which has increased the work and responsibilities of the Anesthesia Department. Invaluable help has been given by a group of doctors from the Research Laboratories in the care of patients who have been treated this way.

The Oxygen Therapy technicians deserve a very special commendation for their skillful and untiring help with our many problems.

Thorkild Waino-Andersen, M.D.,
Clinical Fellow in Anesthesia

THE CHAPLAINS

There comes to the life of every individual some crisis, large or small, which demands the utmost in time, talent, and treasure. To many, this summer has been one of those times. The polio situation has demanded the utmost in time, talent, and treasure from the patients and their families, the doctors, the nurses, and the aides.

From the moment the disease is diagnosed as polio the hours of physical and mental anguish begin for the patient and his family. The patient is afraid — afraid of the dreaded paralysis that people have feared for so many years. The patient is lonely — lonely for his family from whom he has suddenly been taken. When he arrives at the hospital he experiences a series of questions and examinations of a kind to which he is not accustomed. He is finally placed in one of the polio wards. If he requires respirator help he goes to White 9. There is an atmosphere of controlled tension here. Thirty-five or more respirators continue their rhythmic wheezing. But there is more to this ward than respirators. Staff doctors, nurses, aides, floor secretaries, domestics, and others are part of this controlled tension. In one ward there are doctors making rounds. In another there is an anesthetist giving life-saving oxygen to a patient. In another there is a nurse who is suctioning the patient or trying to make him as comfortable as possible. Activities such as these are being carried out on all the wards, constantly.

Many questions go through the mind of a chaplain when he is at work. He knows that the correct answers to these questions may contribute, in a measure, to the efficiency of the staff. A word of encouragement, a helping hand, or just listening while a doctor unloads his mind of its burdens may send that member of the staff back to duty refreshed. A nurse with reddened eyes may need someone to help her move a patient. Or, her heart may be aching for the patients around her. A student nurse may be relatively new to this type of service and be concerned about the great concentration of suffering. Or, it may be that the floor secretary needs someone to go on an important errand for her. In these many and varied situations the chaplain searches his mind for the best ways in which to be of help.

It is the patient himself who elicits the utmost from all who are in attendance in any way. Whether he be in or out of a respirator, he needs help. He is concerned about his future. If he is married he is concerned about his family. He is lonely and afraid of the future. He is tired of being in bed. If he is in a respirator he feels helpless — a burden to the world and to himself. He is discouraged and filled with tension. However, this is only one type of patient personality. There are those in respirators who can still joke. One young man is a perfect example of this. The incident occurred when the shift was being made from White 12 to White 9 and this young man was being moved into the elevator. His head was in one corner and the respirator in the other. As the door closed he shouted gaily, "Down, please." An on-the-job salesman tried to sell his products to the attending doctors one day, providing them with just the lift they needed at that particular time to carry on with their work. These are only two examples of fortitude shown in many ways by the patients themselves.

Then there are the mothers, fathers, husbands, wives, and close friends of the patients who need help. Courage, understanding, patience, and fortitude are required of these visitors who are most closely concerned. To the patient a visitor is the lone star that shines through a cloudy sky. "What time is it?" asks a patient. "Almost half-past eleven." "It won't be long, then," he says. A visitor to a patient is like a medication that soothes, strengthens, and encourages a tired and lonely being. A visitor without courage, understanding, patience, and strength needs to be reminded of whence these attributes come. This is where the chaplain may help. A suggestion here and a word of comfort there can mean a great deal.

In conclusion, this is one chaplain's personal reaction as a member of the polio volunteers. From the moment a patient arrives in the ward he needs care not only for his physical and mental self, but also for his spiritual self. The untiring devotion of the doctors and nurses brings the physical and mental self back to its normal being as soon as possible. This chaplain has great respect and admiration for all the doctors and nurses with whom he he has worked in this situation. But there is that other part of the human personality — the soul — which also needs the services of a trained person. A strong soul helps the powers of recuperation do their work. This has been very evident on the polio floors. There have been many times when there was no drug which would satisfactorily reduce the apprehension of a patient. This chaplain has many, many times seen a pain-lined and apprehensive face change to one of peace after a reading of the Twenty-third or the Twenty-seventh Psalm, a prayer, and the touch of a hand on the brow. There is a confidence and a strength derived from this type of treatment which cannot be duplicated by any other method. In ministering to the sick in a hospital, especially on a service like polio, the chaplain serves all races, creeds, and religions. He may find a doctor who has gone without sufficient sleep for many days and who needs encouragement. He may find a nurse who is filled with grief over her many patients. He may find a student nurse who has just witnessed her first Allen Street. He may find someone who simply needs to talk. In short, as one doctor put it: "The chaplain is a prophet, a priest, a counselor, a friend, and an orderly."

Rev. Theodore C. Hamlin,
Assistant to the Protestant Chaplain

Of the many hospitals in Boston, and in the entire world for that matter, there is hardly one which can compare with the Massachusetts General Hospital in its widespread variety of faiths and nationalities among its administrators and patients. That is why one should not be surprised to see individuals from every walk of life and from every street in the world, even from far-off India, going about the corridors at M.G.H.

As a rule there is not so much the element of surprise, but a certain quizzical attitude noticeable on the part of some individuals with regard to certain services — for instance, that of the chaplains. The trouble is that they look upon the chaplain simply as a *man* and not as the official representative of God which, indeed, the chaplain is. He is primarily trained, ordained, and empowered by a time-tested and divinely founded organization to be the representative of God on earth. The words of Saint Matthew's Gospel enlighten us: "Jesus drew near and spoke to them [His apostles, His first chaplains]: All power in heaven and on earth has been given to me. Go, therefore, and make disciples of all nations . . . teaching them to observe all that I have commanded you . . .". (Matthew 28: 18-20)

It is indeed unfortunate that many refuse to believe that God is practical and has organized a human agency to help, encourage, and solidify the relations of man with Himself. Isn't that the definition of religion? Those who lack such belief could well learn from most of the patients, especially those who are victims of the current polio epidemic. The philosopher says, with reason: "A man has to look up, especially when he's down"; and so, the patient, immobilized in an iron lung, with chances to live very much dimmed, naturally looks *above* for a solution to his problem. And, as all of them attest in their own words, the more they look to God the happier and more peaceful they become, in spite of any physical handicap.

Life and health come to the world through love of God. To stimulate the love of God in the patient is the essential purpose of the chaplain. When, in the early hours of the morning, you see the Catholic chaplain going about the corridors from room to room, he is carrying Holy Communion, the most complete manifestation of love a man can present to his God. Not only do the mind and soul take part, but even the body itself. What better for a sick patient than an actual contact with the Divine Healer!

During every hour of the night and day you will see a chaplain hurrying to the operating room, the emergency ward, to the bedside of a dying patient, to bring to him the assurance of the love of God, to remind him that he must increase his love for his Maker and his Eternal Judge. The Catholic chaplain will often administer the Last Rites, which are extremely consoling to the understanding patient. The Bible explains this in passages from Saint Mark 6: 12-13 and Saint James 5: 14-15.

Also, during the day, the chaplain goes about visiting patients who are not dangerously ill. Always, the primary purpose of the visit is to remind the patient of his love of God and of making his peace with Him.

Some hospitals have in the past closed their doors on everyone but doctors and nurses. The result was that the patient often failed to recover, being dissatisfied and discouraged. "A sound mind in a sound body" is an important truth because both the mind and the body are so naturally and closely related that one cannot be affected without the other also being concerned. In other words, if you want to cure a man, you risk failure if you restrict yourself to the body. The whole man, *body and soul,* must be soothed and cared for. The following words of the Bible are especially significant: "My Son, in thy sickness, neglect not thyself; but pray to the Lord . . . cleanse thy heart from all offense." (Ecclesiasticus 38: 9-10)

Rev. Victor J. Milot, S.M.,
Catholic Chaplain

[We regret that we failed in our attempts to procure an account of a Jewish chaplain's reactions to his work with the polio patients. The rabbi who had been serving at the Hospital had concluded his term of duty and his successor had not been appointed.—*Editor*]

DIETARY DEPARTMENT

Most of the patients on White 9 have by now (October) progressed from intravenous feeding to a modified house menu.

During all stages of the nutritional care of the polio patients "tray precautions" have been effected through the use of paper service. Their food intake has followed almost identical patterns and their consumption, according to the doctors' orders, is arranged to afford them a diet high in protein and fluids, moderately low in carbohydrates and fat, and very low in calcium.

Since the patients are unable to feed themselves, the usual floor service has been modified and, through rescheduling and with the aid of volunteers, the trays are served at such times as will not conflict with the visiting hours.

A "coffee hour" for the professional and personnel groups has been made available in each unit.

Louise Hatch,
Director, Dietary Department

EMERGENCY WARD

With the usual influx of summer infections and vacation accidents, the facilities and personnel of the Emergency Ward were already severely taxed when the first of the poliomyelitis patients appeared. By the early days of August, no day passed without the admission of one or more paralyzed adults or children — several days witnessing the arrival of a dozen such patients. Within a short time, the paralytic patients became less of a challenge, for most of them were admitted promptly to the polio floors with a specific diagnosis. As the epidemic progressed, however, increasing numbers of nonparalytic patients, patients with polio-like diseases, and emotionally upset relatives and others who had been in contact with the patient required attention, consultations, and laboratory evaluation.

Upon receiving a warning by the Admitting Office of a polio referral, either from a private physician or from hospitals not admitting polio patients, the administrative staff of the Emergency Ward sought to arrange for space — usually isolation rooms — for the initial evaluation. This often required the moving of other patients, careful disinfection of the evacuated rooms, and repeated changes of linen. Sterile gowns and equipment were always available for the doctors and nurses; and, most critically, suction machines, oxygen therapy apparatus, tracheotomy sets, and anesthesia machines were kept in readiness. Initial examination was performed promptly by members of the House Staff — medical, surgical, or pediatric — and lumbar punctures and necessary laboratory work were obtained.

Thereafter, emergency procedures — including tracheotomy, intubation, intravenous medications, oxygen therapy — were carried out as indicated, often requiring the immediate aid of special staff members. Surgical, medical, and pediatric consultants, members of the polio team, ear, nose and throat men, anesthetists, oxygen therapy aides, and extra nurses often proved to be life saving.

Despite the burden of usual medical and surgical emergencies always expected during the summer months, the mounting number of polio suspects and victims were seen, evaluated, and cared for without preventable mishap.

William A. Tisdale, M.D.,
Resident in Medicine

HOUSEKEEPING DEPARTMENT

The polio emergency has shown that the cooperation between all departments of the Hospital is something of which we may all be proud. We in the Housekeeping Department played a minor role in the great effort put forth. However, we also can be proud of the initiative and conscientiousness shown by our employees.

Although we were given very short notice of the transfer of respirator cases from White 12 to White 9, the porters were able to have the needed space ready within three hours. This involved washing all the walls of the west wing of White 9, and scrubbing, waxing, and polishing the floors. On the following day the same was done in the east wing. Separate private rooms were done each day as the furniture was removed. The same was done on White 12 after the patients were evacuated to White 9. This work was continued constantly whenever a patient was dismissed from a room. Our special elevator was put at the disposal of the Nursing Service during this time, so that the patients might be transported as quickly as possible.

We have been greatly aided in carrying out our work by all those who are working on the polio floors — doctors, nurses, and volunteers. As it stands at the moment, we are supplying two maids and one porter, all of whom put in much more time than is asked of them.

Our personal thanks go to the employees in Housekeeping who have done so much toward meeting this emergency.

William J. MacNair,
Director, Housekeeping Department

THE LABORATORIES

At the start of the polio influx to this Hospital, the Medical Services involved consulted the Baker Laboratory as to how they could obtain the necessary laboratory examinations with the greatest possible speed. Early laboratory reports were essential in the diagnosis and proper care of the patients.

The initial tests included complete blood counts, urinalyses, and often spinal fluid cell counts. Since the majority of these patients were admitted through the Emergency Ward and the E.W. technician was unable to manage this load single-handed, it was agreed that the Baker Laboratory would try to add this work to its regular busy summer schedule.

Dr. Perry Culver very kindly came to the Department and discussed with the laboratory personnel the necessary precautions to be used both in connection with the patients and with the laboratory specimens.

Before long, additional laboratory tests were required, according to the needs of the patients, and it became necessary for the Chemistry and Bacteriology Laboratories to enter the picture. The respiratory cases in particular needed, in addition, blood chemistries for electrolytes and blood gases and spinal fluid sugar determinations. Many of these patients also needed cultures on tracheotomies and antibiotic sensitivity tests. Blood cultures were also done on a number of patients.

Needless to say, all laboratory personnel pulled together with the rest of the team in the care of the polio patients.

Ellen Wood, B.S.,
Technician-in-Charge

THE LADIES' VISITING COMMITTEE

In the middle of August the Ladies' Visiting Committee was asked by the Volunteer Department to help on the various floors where there were polio patients. It immediately became apparent that on White 12, where the many respirator cases then were, a regular and experienced volunteer could be of great service in helping the floor secretary with the scores of records to be kept daily, answering the continual telephone calls, and sometimes doing emergency errands. Several members of the Ladies' Visiting Committee were reached and were asked to give one or two full days regularly each week. The value of the work required depended upon its repetition, for it naturally takes a few days for the volunteers to learn the procedures.

On August 30, when the patients in their respirators were moved to White 9, we were able to be of assistance during that complicated process — not with the patients themselves, but again with the records and the telephone. We were, and still are, tremendously impressed with the teamwork, cooperation, and quiet efficiency on this vitally active floor.

A little sitting room for the patients' families was quickly set up on this new floor, which has been very much appreciated. We see that there are magazines and fresh flowers in this room. Sometimes we have been asked by a minister or a doctor to arrange for a tray of coffee for families who were in deep distress. The family of one of the patients has donated twelve small but sturdy chairs for this room, for which we are all very grateful.

It has been interesting to note how the families pull together and what a comfort they are to each other. Also, we were deeply touched one day when a mother brought us a box of candy, for she felt we had been hurrying with our lunches and she just plain appreciated the fact that we were there for her to talk with. Imagine, under those circumstances, thinking of other people!

Many impressive experiences have been ours during the time of this emergency. Here are just a few of them: One day a minister who had come directly from Charlestown State Prison brought in two bouquets of mixed flowers that the prisoners had picked from their own garden and had asked him to take to the polio patients. One member of the Ladies' Visiting Committee took a mother from Idaho out to do some necessary shopping after she had finished her work for the day. That mother had immediately flown on here when she was notified that her daughter was stricken with polio in Boston. She says she will always remember this special act of kindness. The wife of a patient telephoned through to the floor one day to ask if we could possibly take the time to ask her husband, who was in a respirator, which shade of gray they should paint their house. He sent back word that Chelsea gray was the correct color and that there were two large cans of this paint in the cellar near the furnace. The wife said to me later that it made her husband seem wonderfully close to her to be able to have such mundane messages relayed back and forth.

Most of our work on the floor where there are the respirators and rocking beds is really with the records and the busy telephones, but there have been innumerable small services — even simply giving time to listen to the families when their greatest need of the moment is to have someone to talk with — that make our service worth while. We have the greatest admiration for the patients and their families, as well as deep respect for every person working on and for this floor.

Virginia B. Arnold,
Member of the Ladies' Visiting Committee

My time on the polio floor has been devoted to assisting the ward secretary in working on patients' charts, answering the telephone, and going on emergency errands to the Pharmacy, the Blood Bank, and to other places about the Hospital.

To me, one of the most memorable days was that of the flood in August. On White 12 every preparation was made to take care of possible power failure. Cables were strung up in the corridors, in case it would be necessary to resort to emergency generators to keep the respirators going. Each room was supplied with flashlights and other equipment for the emergency. Though parts of the Hospital were flooded, the power fortunately did not fail.

The kindness of the patients' families has been amazing. Baskets of peaches, boxes of cookies, and other delicacies have been brought in for the enjoyment of the staff.

The contribution of one of our volunteers is worthy of special mention. Mrs. Henry B. Chapin of Jamaica Plain, who celebrated her 90th birthday in July, has been doing her bit for the polio patients by making hundreds of tracheotomy dressings for the Central Supply Room.

Anna P. Revere,
Member of the Ladies' Visiting Committee

THE LAUNDRY

The polio epidemic placed a terrific strain upon the Laundry, Linen Control, and Sewing Departments. It thrust upon every employee here an additional work load which each assumed with the utmost cooperation. With the Hospital operating at near capacity with 140 (approximately) polio cases, which require over double the amount of linen needed for other patients, we had to increase our overtime considerably. This meant in many instances that various employees were required to work 6 to 7 days per week. This was done without complaint from a single individual, and always on a volunteer basis.

We also added a service new and unique to the Hospital by appointing one man as a liaison agent between the polio wards and the Laundry Department. This was in addition to his other duties. He made periodic checks with all polio floors, starting not later than 4 A.M., repeating at various intervals throughout the day, and continuing as late as 10 P.M. I feel very strongly that this close cooperation was one of our greatest assets in keeping the polio wards sufficiently supplied with all items of linen required for maximum patient care.

Our Washroom production increased between 50,000 and 60,000 pounds for a four-weeks' period over the same period last year. This, of course, meant that our ironers and press line had to assume added work loads. Our Drying Room, where all precaution gowns, johnnies, towels, etc. are dried, assumed the greatest proportion of this added work load. During an average day we ordinarily use between 900 and 1,000 precaution gowns throughout the Hospital. During this epidemic we are processing between 2,500 and 3,000 gowns per day. The use of precaution face masks has also increased tremendously. During an ordinary period 800 to 1,000 masks are used per day. Now we are using close to 3,500 per day. After washing and drying, the masks require almost 10 man-hours per day in merely untying the strings which get knotted in the process.

The Sewing Unit was also affected by the polio situation, in that it had to be able to prepare, on a moment's notice, material for hot packs of various sizes and other items required for polio cases. The mending problem also became more acute, for every item that needed mending had to be finished and back in circulation as soon as possible.

There were many times during the epidemic that the services of the Volunteers were required, especially to fold polio precaution gowns and to untie masks. Their contribution greatly enhanced the effectiveness of our Department.

The Maintenance Department also contributed to our successful operation by working nights in order to make the repairs on our machines which were necessary to keep our Department running at peak capacity.

I also wish to thank the Nursing Service for its contribution of consideration for us. Each ward requisitioned only what it actually felt it needed and, therefore, many items that would have been in short supply were available for distribution to other wards throughout the Hospital.

It has been only through the greatest of efforts and complete cooperation of my assistants and all my employees that the Laundry, Linen Control, and Sewing Departments have been able to meet the excessive demands put upon the Department during this emergency.

James J. Mahoney, Jr.,
Director, Laundry Department

MAINTENANCE DEPARTMENT

The Maintenance Department's duty was to supply and maintain oxygen, vacuum, and electrical facilities so that the doctors and nurses could carry on, without interruption, their work of attending to the patients. We accomplished this by working, sometimes, round the clock. Our department functioned as a team — each member doing what was required, regardless of trade or hours. We purchased, improvised, borrowed, and robbed to get materials from supply houses, contractors, utility companies, and other parts of the Hospital.

When patients first began to arrive on White 12 we were equipped with oxygen and vacuum, but we did not have enough electrical outlets on single circuits for each respirator, nor did we have a stand-by generator in case of a power failure. A separate individually fused line was run to each respirator, and we borrowed a generator from Mr. John Ellsworth of the Boston Edison Company. This generator was set up in the television room of the doctors' Penthouse, and wires were strung to White 12 and later to White 11.

Soon it was obvious that White 11 and 12 would be inadequate to meet the demands as more patients continued to arrive, so Bulfinch 1 was set up with oxygen, vacuum, and A.C. current for 22 outlets. Boards were fastened to the floor and the cubicle curtain rods, on which were hung the oxygen containers, vacuum lines, and outlets. Since the Bulfinch Building is on D.C., we brought in the A.C. lines across the yard from the transformer vault, up the side of the Bulfinch Building, in through the vent ducts to the ward, and thence around the ward on the cubicle curtain rods. This set-up was executed in two days, without moving the patients.

About this time the north wing of Baker 6 was wired with A.C. taken from the basement of the new Medical Science Building.

We were now maintaining 24-hour coverage with a truckdriver and two husky helpers. Hardly a day or night — and especially a week end — would pass without an urgent call for us to pick up a respirator or some other piece of equipment at the Children's Medical Center or somewhere in Framingham, Lynn, Connecticut, or wherever else it could be found.

But more patients still continued to arrive, and we knew that our facilities would soon be inadequate, and it was decided that White 9 must be opened for polio after many years of being used for office space, laboratories, teaching areas, and repositories for truck-loads of miscellaneous material. White 9 could be set up to handle well over 50 cases if needed. Here was work for all. We emptied the west wing, set up the kitchen and utility rooms, strung A.C. outlets and oxygen and vacuum pipes for 24 respirators in 18 hours. As the men were going home to get some sleep, patients were being moved down from the floors above with the aid of long electrical cords in the corridors and outlets in the elevators. The respirators never stopped pumping. The next day the east wing was set up like the west. The south wing was gradually opened as soon as space could be found for the offices. When there was no more space left we moved the offices to the corridors of the Research Building. Walls and windows were often being washed while furniture was being removed, the floor was being swept while the patient was waiting in the corridor to be moved in. Hundreds of items, like footboards, storage racks, and shelves were built, and respirators were remodeled.

A portable generator, strong enough to power the entire White 9 floor as well as the vacuum pumps, is set up in the yard near the White Building. This generator was shipped in from Northampton, arriving at 3 A.M. By 9 A.M. it was in operation, by using the east stair well as a wire shaft. This generator was loaned to us by the Civil Defense, through the offices of the Massachusetts Department of Public Health. The Department was called at 1 P.M., a generator was located, a truck hired, the unit was delivered at 3 A.M. — a job well done.

At present we are providing a daily check on equipment, and are assisting in the movement of patients to the Lemuel Shattuck Hospital.

Raymond V. Kinsman,
Director, Maintenance Department

NURSING DEPARTMENT,

The record of the Nursing Department's contribution to the care of the polio patients in the summer of 1955 is the summary of the activities of all members of the nursing personnel, and the student nurses and student practical nurses in every unit of the Hospital. Although during the acute stage the patients were concentrated on two floors in the Baker Memorial and two floors in the White Building, with some acutely ill children on Burnham 5, workers and students on every ward assumed added duties to give help. Nurses, practical nurses, aides, secretaries, and students volunteered extra hours. The Phillips House, having given all possible full-time nurses to White 9, opened beds to care for the neurological cases, so that White 11 might be available for the growing number of acutely ill polio patients. Nurses from the clinics of the Massachusetts General Hospital planned week-end and evening time in terms of ward needs. For many weeks the day, evening, and night supervisors pooled their nursing resources to assure a safe staffing for the respirator ward.

A review of the staffing situation tells, in part, of the impact of the epidemic on the Nursing Department. The first patient, arriving on July 5, and all additional patients arriving during July were absorbed in the usual way on White 12. On August 1 it was necessary to open Baker 6 to polio patients, and to staff the floor for special care of paralytic and nonparalytic patients. At this time there were 39 nursing personnel and student nurses assigned to these patients in the Hospital as a whole.

By this time the urgency of the situation was evident, and activities to meet it were under way. The search for personnel to staff the growing polio units became everyone's responsibility. A notice was posted asking nurses and student nurses, under a carefully controlled plan, to volunteer to work additional hours. A six-day week for graduate nurses, nurse interns (senior student nurses), and many aides became the common pattern. An appeal was sent to members of the Alumnae Association of the MGH School of Nursing who live in this area. The Staff Education Unit of the Nursing Service began a series of classes for all nursing personnel in the Hospital. These classes were designed to teach the care of the polio patient, and to help in furnishing the emotional support which would enable us as a Department to meet the emergency successfully. Contact was maintained with District #5 of the State Nurses' Association, which had been designated to recruit nurses from the Greater Boston area for the emergency. Instructors from the School of Nursing and supervisors, some of whom had previously volunteered at the Children's Medical Center, worked now with the Staff Education Unit, and volunteered evening and night hours on the respirator floor to orient the new workers and teach the new procedures. On August 23 the National Foundation for Infantile Paralysis was asked for 10 nurses. The first nurse to respond arrived from Florida on August 24. Two additional requests to the Foundation brought a total of 23 nurses.

Meanwhile, the nursing was greatly facilitated by the responses from other departments. A stable team of resident doctors was in constant attendance. This group provided 24-hour coverage on the respirator floor, and assured nurses in other units of the immediate availability of doctors in emergencies. Anesthetists were available to maintain respiration while patients were taken from their respirators for special care. Oxygen Therapy supplied a man to maintain constant vigilance over respirators and oxygen flow. Housekeeping provided extra service to save nursing time. The Laundry worked over-time to maintain an adequate supply of gowns and other linen. Purchasing, Stores, Pharmacy, and Central Supply delivered on call. Dietary provided coffee in the ward kitchens. Social Service was always present when families needed support or the nurses needed assistance with plans for community nursing referrals. The chaplains and ministers from the summer course in Pastoral Care added their special support. Secretaries and others came from many departments to help with clerical work or to feed patients, as the need indicated.

By August 30 the patients in respirators numbered 28, and so had grown beyond the limits of care possible on White 12. The number of respirators needed was increasing daily. More nurses were needed. At the request of the Nursing Department, plans were launched to move the patients in respirators to a larger ward where the nursing care might be better organized. Administration, Medicine, Maintenance, Housekeeping, Nursing — all began to plan. White 9, the floor selected, was fully occupied by two nursing classrooms, a Dietary Department unit, several research units, and other offices. The ward had almost no suction in the 32-bed section, and electric outlets were inadequate.

The record of Nursing cannot tell adequately what the Maintenance Department did to supply suction and electric outlets over night, nor how the many groups were removed from the ward, nor how the Housekeeping Department made the ward ready for the polio patients — all in less than 24 hours. However, we watched the miracle take place, and we know that the almost incredible was achieved. While we watched we could not avoid seeing the eagerness with which these men approached their opportunity to help, nor fail to notice their fatigue after working both day and night to prepare the space and to make safe care possible. Ten student nurses, due to move to McLean for their psychiatric nursing affiliation, volunteered to postpone their assignment and were released by the McLean Hospital School of Nursing as a part of that Hospital's contribution. These students shared in the moving and supplied some of the badly needed nursing care. Members of the Ladies' Visiting Committee transformed a corridor and an office into a comfortable and attractive lounge for anxious families who came to visit patients. The Admitting Officers maintained close touch with the over-all situation, relieving the pressures whenever possible.

The number of patients continued to grow. By the 13th of September 28 nurses and other workers were assigned to Baker 6; 21 to White 11; 22 to Burnham; and 95 to White 9, where there were then 37 patients in respirators, 22 of whom had had tracheotomies. Two Red Cross Aides, especially trained for polio care, had joined us; 23 nurses had been recruited by the National Foundation for Infantile Paralysis, but more help was needed. Throughout the summer, corpsmen from the Chelsea Naval Hospital and the Naval Shipyard at Charlestown had come to help during the evenings. Usually these men numbered about 15. In late August medical students had been secured. About 14 of these men came each night to share in the work of nursing the patients who were in respirators. The Cambridge Visiting Nurse Service, the Navy Nurse Corps, the Army Nurse Corps, the Air Force — all sent nurses for 2 or more weeks. Some of the local industries loaned nurses for varying periods of time. Many of the agencies also paid the nurses while they were on loan. Private nurses added daily to our number. The Boston Visiting Nurse Service consulted with us on referrals. Alumnae of our School of Nursing, and nurses and volunteers who had previously worked at M.G.H. returned for varying periods of time.

The nursing problem was two-fold: first, to secure an adequate number of personnel and to bring organization into a staff, of which half or more changed daily; second, nursing was also needed for other patients in the Hospital, who continued to run a high census for this time of the year.

By September the picture had begun to change. Many patients had gone happily home. Some had been transferred to White 5, White 8, and Burnham 5 for rehabilitation. Hubbard tubs had been installed on White 8 and Burnham 5. The respirator ward, in July and August a place of silence and sucking bellows, had come to life with rocking beds and radios hung on respirators for Red Sox fans to follow their favorite team. There were now some 54 trips to the Hubbard tub daily on Burnham 5; there were more children learning to do their exercises, more patients to teach — and the innumerable hot packs continued everywhere. On Baker 6 there were days when adult patients were lifted 27 times into a bathtub, for there was no special tub on that floor to provide the needed care. The demand for nurses was no less; it was merely different. As summer substitutes began to leave us, a group of theological students joined the nursing ranks. The Nursing Department could understand only too well the difficulties of the Physical Therapy Department as it endeavored to stretch its personnel to meet the challenge.

As autumn comes, we, with the remaining patients and the few who join us daily, face the long pull ahead. It will be many months before our share of the rehabilitation is complete. But the memory of the summer of 1955 will remain for all of us who shared in any way in the nursing at M.G.H. as a heart-warming though tragic and wearying experience. It proved again, and in another way, that the Hospital — our Hospital — can meet whatever emergency comes to its doors. It renewed our faith that nurses, student nurses, and all other nursing personnel can be prepared to do their share when needed. It demonstrated the essentiality of every worker in the Hospital in the total care of the patient. It reassured us that members of the Hospital family and our co-workers and friends in the community will be ready when needed with both understanding and active support. And the patients have left with us examples of faith and courage to remember always.

Ruth Sleeper, R.N.,
Director, School of Nursing
and Nursing Service

PHYSICAL MEDICINE DEPARTMENT

When the polio epidemic struck the Massachusetts General Hospital, the Physical Medicine Department was in a very weak position to cope with such a great influx of patients, most of whom require some degree of physical therapy. The influx came at the height of the vacation season and we had only five therapists available. Very soon there were as many as one hundred patients in the Hospital at one time who, of course, could be given only a minimum of treatment. The residents on the staff were assigned to work with the polio team to see new patients, and particularly to evaluate them for the need of physical therapy and to help make plans for discharge.

The first step was to get emergency aid in the form of additional therapists. Channels had been established for this through the local chapter and national headquarters of the National Foundation for Infantile Paralysis. Two emergency aides were recruited. We also had to have emergency help in replacement of staff members, one of whom contracted polio of a nonparalytic variety. To further help out in the situation, two new assistants were added to the Department as hospital aides, to assist particularly in the underwater treatment of the patients. It soon became apparent that one tub was not enough, and in short order the Hospital procured a standard Hubbard tub which was placed in the solarium of White 8, with all the necessary plumbing and lifting tackle to handle adult patients. Also, a new stainless steel Hubbard tub was fabricated and placed in one of the single rooms on Burnham 5 where all the children's cases were concentrated, so that there were soon three tubs available for treatment. As the number of patients continued to increase and the backlog was maintained, in many instances, two more emergency aides were requested and obtained. Also, the staff positions available were increased an additional two over those previously open in the Department. Thus, we will have a staff of twelve, plus two aides and the students who began their training in October, to help handle the hundred patients who are now being treated by us.

An emergency service established was that of a routine of instruction for parents or relatives in the home care of patients, particularly those not seriously paralyzed.

The Occupational Therapy Department came to our assistance in the handling of patients, as well as in expanding their own activities, particularly for the longer-term patients in the convalescent phase.

The Bay State Medical Rehabilitation Clinic began preparations to handle the expected increase in the load which will be upon us in the latest convalescent stages. There are many seriously paralyzed patients who will require long-term treatment, some of whom will be referred to the Bay State Clinic for their services in teaching the use of crutches or braces, and in training in the activities of daily living and other functional occupational work, to get them ready to return home. The Physical and Occupational Therapy staff was increased with this in mind.

Although the peak of the epidemic seems to have been passed as far as new admissions are concerned, the really hard work is only just beginning for the Physical Medicine Department and the Bay State Clinic. We will be faced with the problem of getting optimum end results, preventing deformities, providing psychological help, and also with the follow-up of the less severely stricken or nonparalytic patients to determine that they are safely through their bout with polio. Some of these patients will have to be followed for many years, therefore increases in physical medicine work will certainly be felt for a long time because of this epidemic.

Arthur L. Watkins, M.D.,
Chief of Physical Medicine

THE POLIO TEAM

Early in the summer the need for a team of residents and house officers whose only responsibilities would be the care of polio patients became increasingly evident. Accordingly, members of the house staff from neurology, medicine, orthopedics, pediatrics, anesthesia, and, later, surgery were drawn together to form a unit which became known as the polio team. In similar fashion a visiting staff was appointed so that the service might have the best in guidance and advice from those physicians who had had the most experience with polio.

As the epidemic progressed, the team became larger and the division of duties more complex. The adult patient with acute polio, but without respiratory difficulty, became the responsibility of the neurologists. Medicine and anesthesia concentrated their efforts on the respiratory unit. Surgery stood by for some fifty or more tracheotomies and innumerable venous cutdowns. Pediatrics cared for those patients under sixteen on White 11 and 12, Baker 6 and 8, and Burnham 5. Orthopedists were evident on every ward, to care for both the acute and the recovering patient.

At the height of the epidemic the number of critical situations met in a given 24-hour period was staggering. Equipment was in short supply and was improvised or rushed in from other areas. Many of the house staff were on their feet for 36 out of each 48 hours. As some patients began to recover from the acute phase of the disease, several groups of physician volunteers from the Research Laboratories lent their services on the respirator floor where many hands were needed in order to utilize the various pieces of equipment. At one time over one hundred individuals were required each day to staff White 9 alone. Personnel were in short supply during the whole summer, as they are even now. During August and September, many midnight calls for help brought responses from other hospitals, from medical schools, from undergraduate bodies, and service personnel.

When large numbers of people are afflicted with the same disease in epidemic form, a hospital like the M.G.H. must do more than provide good care and apply time-honored principles of medical practice. It must also make every effort to contribute to the total understanding of the disease itself by making careful observations and evolving newer concepts of treatment. It is gratifying to be able to report, even at this early date, that this aspect of the Hospital's obligation has been met. Members of the polio team and the visiting staff have collected a mass of data which looks promising for later evaluation. New methods of treatment have been cautiously tried and will undoubtedly find their way into the medical literature.

As this is being written, acute cases of polio are still arriving in the Emergency Ward, though in decreased numbers. However, on most of the wards the emphasis has changed from that of saving a life to that of rebuilding wasted muscles and limbs. This latter task may prove even more difficult than the one just now being completed. Certainly, more patience and wisdom are required to help these patients regain a measure of independence and to adjust to the long process of relearning how to use their limbs.

Leonard W. Cronkhite, Jr., M.D.,
Assistant in Medicine

[Here are a few outstanding impressions made upon a member of the polio team during his days on White 12 and 9. They were given over the telephone — an example of a doctor too busy with his patients to be able to record on paper his contribution to this issue. We give them to you very much in outline form as they were given to us, but each item represents a significant paragraph in its own right. *—Editor*]

We were faced from the start with the overwhelming problem of obtaining both trained and untrained personnel. Securing supplies was also a great problem. Within the space of one week there was a tremendous increase in need for I.V. fluids and antibiotics.

One or more physicians were on duty at all times. Sometimes there were as many as 12 physicians on the floor at the same time. When respirator cases were on White 12, a physician slept in the Penthouse, in order to be instantly available if needed. On White 9 there were 2 physicians each night who often slept in a room on 9.

Scheduling in order to give necessary periods of relief to those who were in constant attendance on patients presented a real problem.

The assistance given by people in all categories (professional and nonprofessional personnel) from the Research Building was especially noteworthy. When these laboratory research people and clinical fellows discovered there was a need of personnel volunteers to aid in the emergency, large numbers of them from the Research Laboratories offered their services in whatever capacity the Hospital felt they could best be used. They served as substitutes for anesthetists, nurses, and corpsmen in general. Within two weeks of the onset of polio, attempts were made to get the patients out of the respirators by using small chest respirators. It was in this and in the task of moving patients from the respirators to rocking beds that these research people were so remarkably helpful. Moving patients as soon as possible from the respirators to the rocking beds lifted their morale and made possible the early retraining of muscles not involved in the polio attack. People from Research also donated many hours a day (under Dr. Gross) in assisting the Anesthesia Department in taking care of positive pressure respirators.

Everybody worked together, and it would be impossible to recount all the amazing things that people accomplished — for instance, even the special footboards made by the carpenters, to fit within the respirators according to individual requirements.

Richard H. Eppright, M.D.,
Assistant Resident in Orthopedics

PSYCHIATRY DEPARTMENT

The Department of Psychiatry became aware, early in the polio epidemic, of a need for a psychiatric study of a clinical picture appearing in a large number of seriously ill patients which resembled a toxic delirium. We felt it was also of interest to attempt to understand the psychological effect upon the patient of an overwhelming illness of this type and to determine whether or not there was a need for a psychiatrist in such a crisis situation. It was also felt that the effect upon the community of such a widespread epidemic must be great, and some effort was made to study this over-all effect upon families, friends, and the community as a whole. A somewhat similar project was undertaken by the Department of Child Psychology to better understand the effect of hospitalization upon both children and family. With these general goals in mind, two residents began a comprehensive and intensive interview program to include all patients in respirators and, subsequent to this, a large number of nonrespirator cases — actually, all the adult polio cases in the Hospital during one of the peak epidemic weeks. This eventually amounted to approximately 150 clinical diagnostic interviews.

In addition to this, it was felt that the respirator group of patients warranted more intensive psychiatric study. While this was done at first to document a very unusual type of delirious phase manifested by some of the more seriously ill polio cases, it soon became apparent that as psychiatrists we were fulfilling an urgently felt need on the part of most of the patients to talk about their worries, fears, and anxiety during certainly one of the most acute crises of their lives. These were problems about which they hesitated to talk to their families and the then overtaxed staff. As a result of this, we were visiting the patients almost every day, fulfilling a role in this Hospital similar in many ways to that assumed by the psychiatrists during the time of the Cocoanut Grove disaster. Now, as then, it is hoped that out of the observations made, more knowledge of the psychological response to overwhelming illness and a more effective method of dealing with the rehabilitation aspects of such illnesses will be attained.

Martin R. Coles, M.D.,
Assistant Resident in Psychiatry
Jimmie Brockman, M.D.,
Resident in Psychiatry

RADIOLOGY DEPARTMENT

Patients in respirators *may* suffer from collapse of the lung or a superimposed infection. To be sure that we were aware of any changes taking place in the patients' respiratory condition, it was essential that x-rays were taken. To do this, the X-ray Department took portable x-ray units right to the patients who were in the respirators. The patient had to be removed from the respirator so that the films of the chest could be taken. This required the immediate cooperation of the anesthetists with the breathing machine. In some instances the procedures lasted anywhere from 30 to 60 minutes. The maximum requests in a single day were for the filming of 12 patients.

The X-ray Department was on call for this service, with technicians assigned to the floor. This service was considered emergency, and priority was given to requests from the respirator floor whenever possible. On some days technicians remained on the floor the entire day.

The films were promptly read in the X-ray Department, for if it was found that there was a collapsed segment of the lung without infection, the anesthetists or surgeons with the use of the bronchoscope could correct the trouble.

We wish to express great appreciation of the wonderful cooperation on the part of the x-ray technicians who, without complaint, assumed extra responsibilities. We feel that they also greatly improved the techniques to a point where they have achieved a high degree of accuracy, despite the difficulties encountered with the portable unit as compared with stationary equipment.

John D. Reeves, Jr., M.D.,
Assistant Radiologist

SOCIAL SERVICE

"Is this something with which Social Service could help me? The worker who spoke with me the other day was so kind, and she said to be sure to call Social Service if any problem should arise. I realize this is Saturday afternoon, but it would mean so much if I could get in to see my wife — even for twenty minutes. We have so much to talk over." The immediate problem was the need of a baby sitter in his home so that this 27-year-old husband and father could visit his 25-year-old wife who was here at M.G.H. in a respirator. He was not only faced with a lack of community facilities but was experiencing the impact of his locality's fear of contagion. Neighbors would like to help, and indeed a great many had done so, but in some instances others were understandably loath to go into a home where a patient with polio had been.

This type of call and many others came in to the "Polio Office" which the Social Service Department established on White 5 and covered all day every day except Sundays. Here, under the leadership of an experienced member of the staff who coordinated all the work, we maintained a master card file of all polio patients admitted, assigned coverage, and centralized all requests for service and calls for information.

At medical request we set the goal of seeing relatives of all polio patients admitted to the Hospital, to offer service to them and the patients, to secure pertinent social information which would aid in the doctor's and our better understanding of the patients and their families in their adjustments to severe illness and handicap, and in the possibilities for carrying out medical aftercare plans. This social information was placed in the patients' medical records, so that both in current treatment and in consideration of discharge plans it could assure suitable, individualized aftercare plans.

To facilitate contact with relatives, a notice was given to them by the Admitting Officers at the time of the patients' admission, telling of the service and the office where calls and appointments could be made. Many patients and families were also referred directly by the doctors, while still other relatives who did not call the office were seen during visiting hours on the wards.

A complete resource file of institutions and agencies which offer convalescent care, chronic care, and clinic care throughout the State was compiled to aid in discharge planning.

The children and their parents presented special needs in meeting hospitalization, separation from family, and acceptance of discharge to other institutions if home care was unsuitable. The parents had many fears which had to be allayed. They were helped when they expressed their feelings of guilt about their child's having developed polio, also when they were aided with practical plans for housekeeper help at home.

The Child Psychiatry Unit has seen a small group of children and their mothers. In conjunction with the child psychiatrists' service to the children, the social workers have seen the mothers once a week, helping them to handle their feelings about the illness, to understand the immediate medical situation, and to face the long recuperative process ahead. This service is furthering our understanding of reactions to hospitalization, separation, and immobilization, and will be helpful as a control group in an on-going study of emotional factors in children with rheumatoid arthritis.

The young adult patients, many between the ages of twenty and thirty-five, have called forth our greatest admiration and effort in service. These young people, on the threshold of their careers in life, many of them having established homes and with young children, are magnificently meeting critical illness, permanent handicap, or long-range rehabilitation — any one of which will disrupt many of their cherished hopes and plans.

Both parents and relatives have needed continued reassurance and support, as well as assistance in practical planning. The immediate emergency needs for housekeepers where the mothers are ill is one example. If the wage earner is stricken and family maintenance is needed, workers have helped families in applying for and securing public assistance. Rooms near the Hospital have been found for relatives. The working out of careful discharge plans in the homes, with additional assistance from visiting nurses, physiotherapists, or domestic help has been done. Arrangements for admissions to convalescent or chronic institutions have been facilitated.

All of our staff have in some way been involved in service to the polio patients — eleven members in direct service to patients and families, and others in relieving these eleven workers from their regular assignments in order that they might help with the polio patients.

We are particularly grateful that a worker, loaned for three months from California by the National Foundation for Infantile Paralysis, has arrived here. Several years ago we loaned a staff member to the Foundation to work in Los Angeles during their epidemic, and this exchange contribution during our emergency is most gratifying.

At this point it is still difficult to comprehend the extent and the immensity of the situation in which we have been trying to serve these courageous patients. The impact of the emergency is lessening, but we know that the greater needs are going to continue in the long months and even years ahead during convalescence and rehabilitation, or, in some instances, in adjustments to permanent disability. It has been a privilege to know and serve these patients, and we have learned much in how the human spirit can rise above heartbreaking situations.

Josephine C. Barbour,
Chief of Social Service

VOLUNTEERS

During these past summer months, from June through September, when the volunteer schedule is usually lighter than during other months of the year, our volunteers contributed 15,854 hours of service.

As the polio emergency grew in intensity many volunteers doubled their time and recruited new volunteers. Red Cross Nurses Aides and Gray Ladies answered their Chapters' appeals. Round the wards and in other areas of the Hospital they performed many time-consuming tasks, such as secretarial work and other duties on the wards. They answered telephones, went on errands, performed escort service, folded gowns, fed patients, and made themselves useful in countless other ways.

What our volunteers learn is not just how to fold linen, not just how to stuff cotton into tubes in the Central Supply Room, but actually to realize that there are many jobs to be done in the Hospital and, regardless of how menial the task may be, to do it gladly and humbly. Our volunteers believe and know that they are here "to do" and "to give", and this is the spirit they exemplify.

Mary Ruth Wolf,
Director, Volunteers

Representative letters from families of patients:

Dear Dr. ————:

I want to thank you and the other doctors and nurses for what you did for my husband while he was in White 9. For such a large hospital, you would expect everyone to be very impersonal about their patients, but you all were so different. Everyone was so thoughtful in every way.

The thing I shall always remember about you is what you told me — to have faith in God and prayer. At the time it didn't mean a thing, but as days go by I find I do have faith in God and prayer.

Dear Dr. ————:

I should like to express my gratitude to you and the members of your medical team for all the efforts expended in the care of my husband last month.

Words seem so inadequate, but knowing everything possible was done has helped me to accept my loss. Thank you for your kind understanding under such difficult circumstances.

I am most grateful to you.

Dear Dr. ————:

My sister was a polio patient at your hospital recently. Words cannot begin to tell you the thoughts I wish I could express. Everyone was kindness personified — the doctor, the personnel of the 12th floor, elevator operators, and even the guards at the parking lot. Although I have been hospital-connected for over twenty-five years, never have I witnessed such efficiency and teamwork! We all are so very grateful for all that was done. It seems so very little to offer you a heartful of thanks and gratitude.

In lieu of flowers we suggested donations to the polio fund, and at the time I left the amount was in three figures.

It is very comforting to know that my sister had all the care it was possible to give. My hurried trip over was softened by the thought that she was at the Massachusetts General.

* * *

The American Hospital Association, at its annual convention on September 21, conferred Honorary Membership on Miss Ruth Sleeper—the first nurse to be so honored. The award was given "in recognition of her progressive leadership and diligent service in improving nursing care, and because of her inspired and untiring efforts to better the health of mankind."

* * *

A pension plan for employees of the Massachusetts General Hospital, including the General Hospital in Boston, McLean Hospital in Waverley, the Vincent Memorial Hospital, and the Hall-Mercer Hospital (Massachusetts General Hospital Division), went into effect on September 5. A pamphlet, describing the principal features of the plan, has been issued. The Hospital will pay the pensions provided by the plan, without any contributions from our employees.

The Board of Trustees, at their meeting on September 16, voted:

To accept, as of September 30, the resignation of Mr. Reginald Gray as Secretary of the Corporation with great regret and with an expression of appreciation for his long years of devoted service;

To elect Mr. Elliot Lee Richardson as Secretary to fill the unexpired term of Mr. Reginald Gray;

To accept the resignation of Lowell P. Hager, Ph.D. from the position of Assistant Biochemist, effective September 3.

To promote:

Mary Ellen Jones, Ph.D. to the position of Associate Biochemist (Medicine), for a period of three years, beginning July 1;

Karl Schmid, Ph.D. to the position of Associate Biochemist (Medicine), for a period of three years, beginning July 1.

To reappoint:

Dr. Byron H. Waksman as Associate Bacteriologist (Neurology), for a period of three years, beginning July 1.

To appoint:

Dr. Philip R. Dodge as Assistant Neurologist, beginning October 1;

Dr. Benjamin G. Ferris as Consultant in Medicine;

Dr. Justin R. Hüppe as Resident in Radiology (extra) for one year, beginning March 1, 1956;

Dr. Louis L. Weiss as Assistant Resident in Anesthesia, beginning October 1.

At their meetings on September 14, 21, and 28, the General Executive Committee voted:

To reappoint:

William L. Bencze, Ph.D. as Research Fellow in Medicine for one year, beginning September 29;

Werner Ritschard, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning October 1.

To extend the appointments of:

Dr. John A. Scholl as Clinical and Research Fellow in Neurosurgery, for a period of twelve months rather than six months, as previously recommended;

Dr. Snorri P. Snorrason as Graduate Student Assistant in Medicine, assigned to Cardiology, through December 31.

To appoint:

Dr. Howard J. Bagnall as Clinical and Research Fellow in Neurosurgery for one year, beginning September 22;

Dr. George E. Burket as Graduate Student Assistant in Surgery, beginning September 12;

Dr. Ruben D. Cabrera as Graduate Student Assistant in Orthopedic Surgery, for the term September 6 through December 5;

Dr. Odom N. Coker as Graduate Student Assistant in Surgery, beginning September 6;

Robert Crokaert, D.Sc. as Research Fellow in Biochemistry, beginning September 15;

Dr. William M. Crowell as Clinical Fellow in Psychiatry, beginning September 1;

Dr. William G. Durnin as Graduate Student Assistant in Orthopedic Surgery, for the term September 6 through December 5;

Dr. Thorkild Friis as Clinical and Research Fellow in Medicine, for the period September 1, 1955 through February 29, 1956;

Dr. Shinzo Isojima as Research Fellow in Immunology for one year, beginning October 1;

Dr. Hsing Y. Lee as Graduate Student Assistant in Orthopedic Surgery for one year, beginning September 20;

Ann D. Salomon, Ph.D. as Clinical and Research Fellow in Psychology for one year, beginning September 1;

Dr. Mariano A. Sandiego as Graduate Student Assistant in Surgery, for a period of six months, beginning September 12;

Dr. W. Raymond Shanahan as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning November 1;

Dr. Kadhim H. Shubber as Clinical Fellow in Orthopedic Surgery, for the period October 1, 1955 through January 31, 1956;

Dr. Ingrid Sondergaard as Clinical and Research Fellow in Psychiatry for one year, beginning October 15;

Dr. Herman W. Spater as Clinical and Research Fellow on the Children's Medical Service for one year, beginning September 1;

Dr. Wirjo K. Subiakto as Graduate Student Assistant in Orthopedic Surgery for one year, beginning September 20;

Dr. Teofilo Trevino as Graduate Student Assistant in Orthopedic Surgery for one year, beginning September 6.

MASSACHUSETTS EYE & EAR INFIRMARY

On September 26, the House Officers of the Infirmary were privileged to hear an address given by Sir Norman Gregg of Sydney, Australia, a personal friend of Dr. Edwin B. Dunphy. Sir Norman is renowned for making one of the most outstanding contributions in the field of medical research in the past decade. His paper, published in 1941, showed the connection between rubella and congenital cataracts, if contracted during pregnancy. This led to the discovery of further connection between German measles and congenital heart disease and deafness. For this important work, Sir Norman Gregg was knighted.

The joint meeting of the American Academy of Ophthalmology and Otolaryngology was held in Chicago, October 8-14. The ENT staff of the Infirmary was represented by: Dr. Philip E. Meltzer, vice-president, who presided over the Otolaryngological Section meeting on October 10; Dr. George F. Reed, who took part in a symposium on "Errors in the early diagnosis and treatment of cancer in the upper respiratory tract" — Dr. Reed spoke on "The pharynx"; Dr. V. H. Kazanjian, who participated in the special scientific programs and spoke on "The median forehead flap for the repair of defects of the eyelids and nose".

Speaking in the Continuous Courses and panel discussions on Otolaryngology were: Dr. V. H. Kazanjian on "Traumatic injuries of the face"; Dr. Philip H. Meltzer on "Your otological office problems" —panel discussion; Dr. Daniel Miller on "ENT cancer can be treated in your community"—panel discussion, and "Laryngeal emergencies in infants and children"; Dr. George Kelemen on "Mechanical injuries of the hearing organ" and "Otitis media: Pathologic changes as a guide to clinical procedures".

Members of the Ophthalmology staff who addressed the meeting were: Dr. Robert R. Trotter, who spoke by special invitation at the Ophthalmology Section on "Diamox: Further reports on its use": Dr. Brendan D. Leahey on "Corneal transplantations with track suture"; and Dr. Paul A. Chandler discussed "Posterior sclerotomy and air injection in the treatment of flat anterior chambers following cataract extraction".

Several doctors from the Infirmary participated in the Continuous Courses in Ophthalmology given at the Academy meeting. Speakers from the Infirmary included: Dr. Charles L. Schepens on "Indirect ophthalmoscopy: Technique"; Dr. Albert E. Sloane on "School vision testing" and "Telescopic lenses"; Dr. Abraham Pollen on "Prescription of prisms"; Dr. Paul A. Chandler on "Cataract surgery"; and Dr. Brendan D. Leahey on "Cataract transplantation".

A new five-volume loose-leaf textbook titled *Otolaryngology,* edited by Coates, Schenck and Miller, has just been published by W. F. Prior Co., Inc.

The book points out that otolaryngology is a field that is constantly expanding in all its branches. Some of the extensive new fields which have been reopened to the otolaryngologist are rhinoplastic and otoplastic surgery and audiology.

Another feature of these volumes is that a rigidly bound book on this field may soon become obsolete, but a loose-leaf work can be constantly brought up to date without the necessity of a complete new edition. The old passages may be taken out and new information inserted. The editors and publishers of this book intend to see that this plan is carried out by frequent revisions and with the addition of entirely new chapters when necessary.

Among the Infirmary contributors to the book are: Dr. Robert L. Goodale on "Bronchiectasis (Bronchosinusitis)"; Dr. George Kelemen on "Osteomyelitis of the temporal bone"; Dr. Harris P. Mosher on "Fulminating osteomyelitis of the frontal bone complicating acute infection of the frontal sinus"; Dr. Lyman G. Richards on "Acute laryngotracheo bronchitis"; Dr. LeRoy A. Schall on "Tumors of the temporal bone"; and Dr. Francis L. Weille on "Surgical problems involved in the removal of glomus jugulare tumors" and "The otolaryngological technique for block dissection of the neck".

Dr. Robert L. Goodale spoke at the Peter Bent Brigham Hospital on "Atrial septal defects". His lecture was given on October 16 as part of the courses offered by the Postgraduate Medical Institute of Boston.

Dr. Alexander S. Macmillan, Jr. gave three instruction courses on X-ray at the American Roentgen-Ray Society meeting in Chicago, which was held on September 19-23.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Cardiology

Goodale, F., Jr., Sanchez, G., Friedlich, A. L., Scannell, J. G., and Myers, G. S.
Correlation of pulmonary arteriolar resistance with pulmonary vascular changes in patients with mitral stenosis before and after valvulotomy.
New England J. Med. 252:979-983.

General Medicine

Burrage, W. S., Mansmann, H. C., Jr., and Irwin, J. W.
Current methods of diagnosis and treatment of asthma.
A.M.A. Arch. Int. Med. 96:369-374.

Rasmussen, H.
Iodide hypersensitivity in the etiology of periarteritis nodosa.
J. Allergy 26:394-407.

Wang, D. M. K., Burrage, W. S., Irwin, J. W., and Aronow, S.
Cortisone or hydrocortisone in the treatment of severe, intractable asthma?
J. Allergy 26:448-452.

General Surgery

Cope, O., and Raker, J. W.
Cushing's disease: The surgical experience in the care of 46 cases.
New England J. Med. 253:119-127; 165-172.

Dexter, C. J.
Acute diverticulitis of the cecum with perforation.
Am. J. Surg. 90:535-536.

Laboratory Science

Bandurski, R. S., and Lipmann, F.
Synthesis of phosphoryl-enolpyruvate from oxalacetate.
Federation Proc. 14:176-177.

Gregory, J. D.
Nucleoside diphosphatase of liver mitochondria.
Federation Proc. 14:221.

Gregory, J. D.
The stability of N-Ethylmaleimide and its reaction with sulfhydryl groups.
J. Am. Chem. Soc. 77:3922.

Hager, L. P., and Lipmann, F.
The relation between acetoin condensation and pyruvic oxidation and pyruvic oxidase of *Lactobacillus delbrueckii.*
Bact. Proc., 1955:113.

Hilz, H.
ATP-sulfate reaction.
Federation Proc. 14:227.

Jones, M. E., Spector, L., and Lipmann, F.
Mechanism of citrulline synthesis.
Federation Proc. 14:232.

Matoltsy, A. G., and Balsamo, C. A.
A study of the components of the cornified epithelium of human skin.
J. Biophys. & Biochem. Cytol. 1:339-360.

Mudd, S. H., Park, J. H., and Lipmann, F.
Magnesium antagonism of the uncoupling of oxidative phosphorylation by iodo-thyronines.
Proc. Nat. Acad. Sc. 41:571-576.

Waksman, B. H., and Adams, R. D.
Allergic neuritis: An experimental disease of

rabbits induced by the injection of peripheral nervous tissue and adjuvants.
J. Exper. Med. 102:213-236.

Otolaryngology

Kelemen, G.
Osteomyelitis of the temporal bone.
In Otolaryngology, Coates, G. M., Schenck, H. P., and Miller, M. V., Editors, Hagerstown, Md., W. F. Prior Company, Inc., vol. 2, chapter 20.

Surgery — Reconstructive

Webster, R. C., and Ju, D. M.
Posterior pharyngeal wall flaps in the rehabilitation of complicated palate cases.
Cleft Palate Bull., vol. 5, no. 3:2-4.

NOTES ON NIPPON — 1954

Two hillside vistas stand out in retrospect:

One was from the home of "Madame Butterfly", overlooking Nagasaki Harbor. When the second atomic bomb was dropped on August 9, 1945, one of the principal targets was the Mitsubishi Shipyard. And yet only nine years later almost to a day, afloat in the harbor, and in the final stages of being fitted out, were two sleek new merchantmen, recently created in this same shipyard.

The other was from the Atomic Bomb Casualty Commission, overlooking Hiroshima. This sight was striking only in that nothing remarkable was to be seen, as the entire city had been rebuilt *in toto,* and, except for one or two intentionally unchanged ruins, there were no really evident reminders of the massive destruction which had occurred less than a decade before.

The events and circumstances of the intervening years between "unconditional surrender" and these evidences of reconstruction are common knowledge: the wisdom of retaining the Emperor; the immediate and almost complete subordination of the Japanese people to the Occupation Government; the success of General MacArthur as a powerful leader with a flair for the melodramatic; the economic stimulus of the Korean War; and the at least apparent (and hopefully real) friendship which developed between the members of the occupation forces and the people they came to know. But the less often mentioned factor in what has been a historically unique relationship between the conquering and the conquered is the catalyst which has made this fortunate reaction possible — namely, the tremendous energy of the Japanese people, which seems to have remained essentially unchanged despite the effects of a total and unsuccessful war.

But there are other than just the economic manifestations of this same dynamic quality which have remained or have developed during the postwar era, and among these are the cultural elements.

Theatrically, the Japanese can boast of one of the world's finest contemporary productions — "The Takarazuka Review" — which includes an all-girl cast, elaborate settings, striking costumes, and a fast-moving routine which makes a five-hour performance seem only minutes long. Or the more distinctly Japanese play, the Kabuki, which employs almost every effective trick of the drama, from revolving stages to ostensibly floating sampans, and dancers using timing in a way Hollywood might well envy.

In the line of handicrafts, the people of Hakata, in what is a true "backyard industry", produce figurines which are noteworthy, not only for their realism, but for the bits of life they portray.

One hundred miles to the north of Tokyo, at Nikko, the first three members of the Tokugawa Shogunate are buried in a series of magnificent and ornate shrines. For over three hundred years each building has been retouched every twenty years, and even today a number of the elaborate wooden frescoes and glossy enameled finishes are being methodically and completely redone.

The Japanese have a saying in which there is much truth, that not to see Kyoto is not to see Japan. Kyoto was not only the political capital for over eight hundred years, but has remained the cultural center of the country, which is perhaps the reason it was carefully spared by the American B-29's. It remains today untouched, with its artists vigorously at work producing ceramics, jewelry, woodblock prints, and etchings, all of which have been painstakingly and beautifully executed.

Agriculturally, too, the evidences of Nipponese industry are manifest. In late May and in June, at the peak of the rainy season, when the rice is being planted, the entire family from grandmother to grandchild can be seen tirelessly stooped over, laying out the young sprouts freehand, but in lines which are incredibly straight and symmetrical. And as the corollary of the Japanese economy in farming is the premium which necessity has demanded be placed on space. Archibald MacLeish has given a graphic description of this situation:

"There are the roads always narrow and mostly at the wood's edge or the river's. . . . There are the whole plains empty of roofs, squared into flats of water, no inch for walking but the dike backs, not so much as a green weed at the foot of the telegraph poles or a corner patch gone wild.

"There are the fields empty of crows after harvest; thin picking for black wings after cloth ones. . . .

"There are the forest floors swept clean and the sweeping bundled in careful, valuable piles. . . .

"There are the rivers diked and ditched and straightened to recover a napkin's breadth of land and the hill valleys terraced till the steepest slope turns flatwise to the sun."

There is one way in which this frugality of space is relaxed. In the fall, when the golden rice is harvested and the paddies are finally at momentary rest, the corners of the fields and cracks between the houses are suddenly warmed by the rich yellows and reds of the national flower, the chrysanthemum.

Even in what little recreation these people have time for, their dynamic qualities are evident. One incident in particular is memorable. It was 3 o'clock A.M., at an altitude of 10,000 feet. One hundred miles to the north lay Tokyo Bay. And nearer at hand, from timberline to the summit of Fuji, a continuous string of bobbing lights, 5 miles in length and representing several hundred plodding people, dominated the starlit landscape. Two hours later and 3,000 feet higher it was possible to enjoy one of the scenic highlights of Japan as a great red sun eased its way up over the horizon. But even more spectacular than the sunrise had been the chain of lights which this persevering, patient, energetic people had created in their predawn pilgrimage to Nippon's pinnacle.

Giles D. Toll, M.D.,
Assistant Resident in Surgery

New addresses:—

Dr. Margaret Anthonisen (r.p. *Psychiat.* (*McL.*) 1934), Mary Hitchcock Memorial Hospital, Hanover, N. H.
Dr. Benjamin A. Barnes (*W.S.* 1945), Department of Surgery, Massachusetts General Hospital, Boston 14, Mass.
Dr. George Christman (*Dn.* 1951), 403 Commonwealth Ave., Boston, Mass.
Capt. Richard A. Currie, MC, USAR (*S.* 1950), U.S. Army Hospital, Camp Gordon, Ga.
Dr. Ihsan Dogramaji (gr. a. *C.M.* 1945), 142 Atatunk Bulvari, Ankara, Turkey
Dr. Arthur C. Guyton (*W.S.* 1943) Box 153, Route 7, Jackson, Miss.

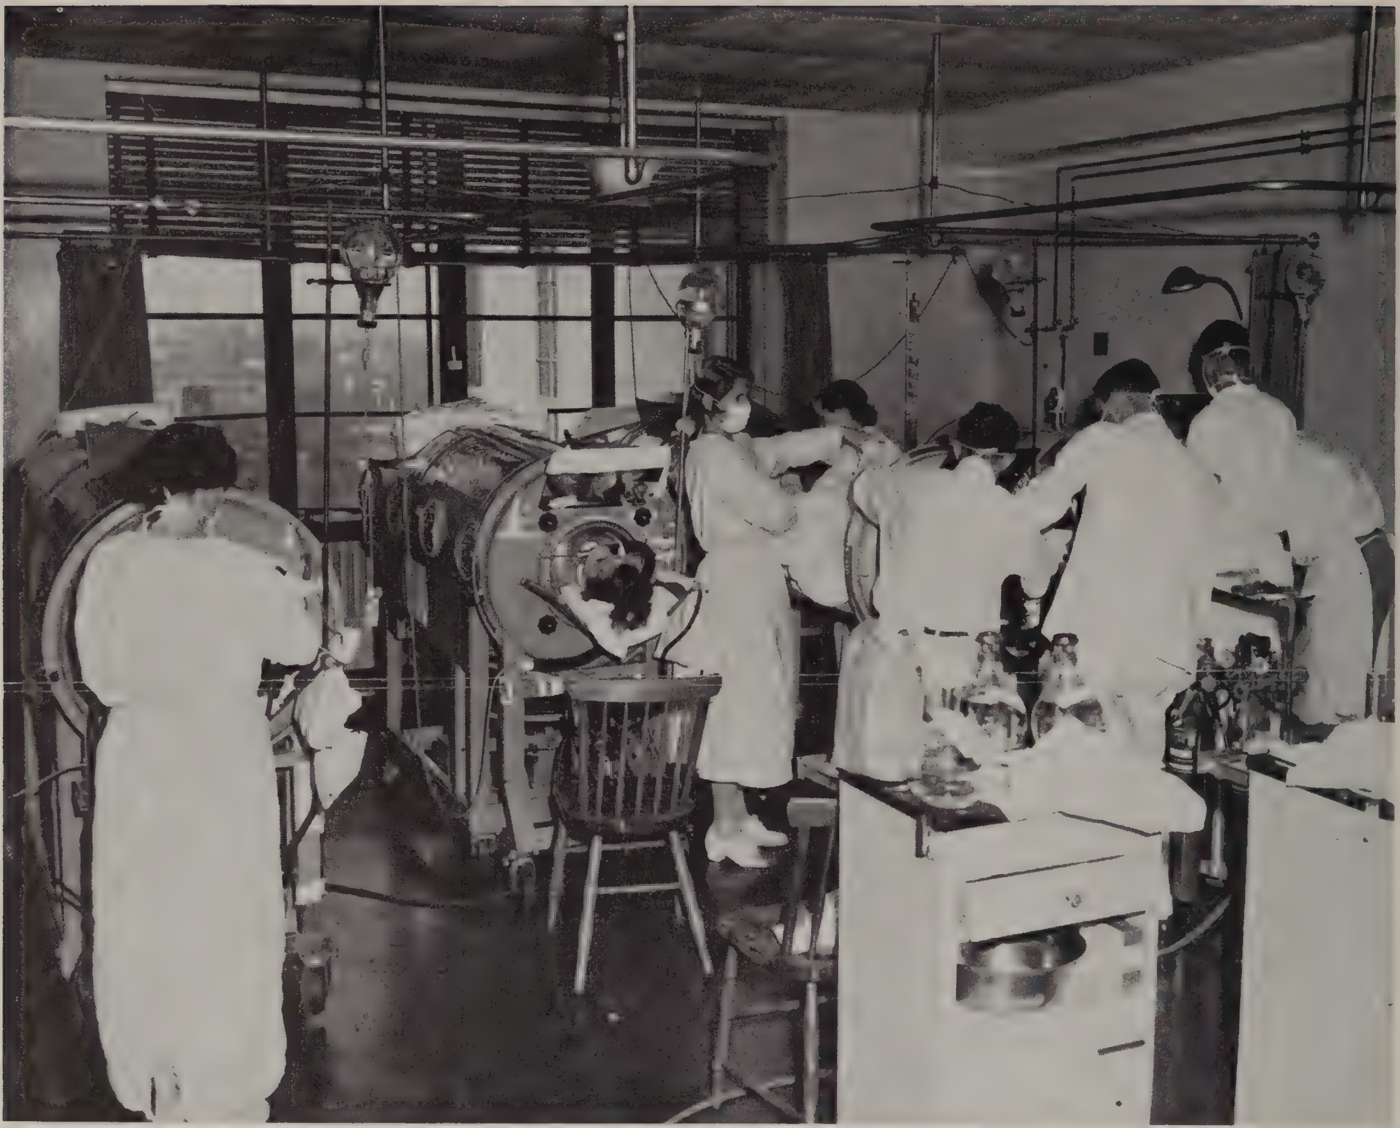
Brief bits:—

Dr. Otto E. Aufranc spoke at the convention of the International College of Surgeons in Philadelphia on September 13. His topic was "The application of mold arthroplasty to conditions of the hip".



One small section of a polio floor at Massachusetts General Hospital

---

Dr. J. H. Means has had a very full lecture schedule since last spring. On March 28 he gave the Kober Lecture at Georgetown University. The title of his talk was "The nature of medical research". On April 3 he participated in the Ford Hall Forum on the subject "The high cost of medical care: What can we do about it?". On April 18 he spoke before the Boston University Phi Delta Epsilon Fraternity. His title was "The need for experiment in the social as well as the biologic area of medicine". On May 14 he took part in a panel discussion on "The role of the teaching hospital", at the opening of the new University Hospital of the University of Saskatchewan at Saskatoon, Canada. At the request of the Right Reverend Henry K. Sherrill he paid a medical goodwill visit to St. Luke's Hospital, Tokyo, Japan, from the middle of June to the middle of August. Mrs. Means and his stepdaughter, Beth H. Butler, accompanied him on this journey. We hope to report on the Japan trip in an early issue of The News.

Dr. Leonard D. Rosenman (*E.S.* 1943) appeared in the office of The News not long ago. We always appreciate visits from old friends and wish they might stay longer.

A card from Dr. John W. Smillie (*E.S.* 1944) says, in part: "I continue to be an Assistant Professor of Ophthalmology at the University of Michigan Medical School; but, as this is a fair-sized institution, mail addressed to me as Department of Ophthalmology, University Hospital, Ann Arbor, Michigan, will be in my hands a day or so earlier."

Dr. Jacob H. Swartz announces the removal of his office to 483 Beacon St., Boston, Mass.

Dr. John F. Tannheimer (r.p. *Path.* 1945 & a.r.p. 1948) paid us a nice visit recently.

Dr. Richard Warren announces the removal of his office for the practice of surgery to the Peter Bent Brigham Hospital.

Dr. Richard C. Webster has accepted the Chairmanship of the Program Committee of the 1956 Kansas City Convention of the American Association for Cleft Palate Rehabilitation.

This letter from Dr. Philip L. Pillsbury (*W.M.* 1942) includes a new address for him—new as far as our records are concerned. From 3512 Clay Street, San Francisco, California, he writes:

While I would like to enjoy any distinction, however minor, that of being a "singleton" in Ross is no longer mine. In fact, I have been living in San Francisco since 1946. After leaving the military service I came here as assistant resident and then resident in Medicine at Stanford University Hospitals. Later I engaged in the private practice of Internal Medicine in association with Dr. Walter Beckh in this city. Very fortunately, I have been able to continue my academic interests as a clinical instructor in Medicine at Stanford.

This letter would not be complete if I failed to mention a little personal history. I married Patricia Gilbert in 1946. We now have four children. We still plan for the day when we shall be able to return to Boston and the M.G.H. to renew old friendships.

[This letter illustrates the fact that unless we are notified of a change of address there is no way for us to keep our records—including the Directory section of our Annual Report—up to date.—*Editor*]

This letter has come from Dr. Harvey D. Rothberg, Jr. (*M.* 1954), Department of Hematology, Walter Reed Army Medical Center, Washington 12, D.C.:

My wife and I both enjoy receiving The News each month, as it is one of our main ways of keeping in touch with the Massachusetts General Hospital (where we met!).

We've been down here now for over a month, and are very enthusiastic about Washington. Pending call to active duty in the Air Force (which did not come when expected), I am working as medical officer in the hematology department of Walter Reed Army Medical Center. My work will be about 75% research — probably mostly in the areas of spleen functions, hemopoiesis, and hemolytic anemia. At the moment, however, I'm spending about half my time learning techniques used in working with radioisotopes. I'm in the outpatient clinic two afternoons a week, and go on hematology ward rounds twice weekly. There's an active teaching program here, too; in fact, I was informed that later on I will be giving a couple of lectures myself.

All in all, this promises to be a most interesting year, but whether it will last that long is problematical.

⁂

Contributions to The News in the amount of $575.60, over and above subscriptions fees, were received during the fiscal year 1954-1955. A note of appreciation is always sent to each contributor, but The News takes this opportunity to express publicly its thanks for such generosity from so many of its readers.

THE NEWS

No. 151 Boston, Mass. December 1955

MEDICAL CLINIC

On the sixth of October, 1818, a young man was brought by his father to the first unit of the Massachusetts General Hospital, which unit later became known as the McLean Hospital. The Hospital had opened its doors but two days earlier, and the arrival of father and son was the occasion for considerable activity. We are told that "the Committee spent three hours in conversing with him in order to learn all the particulars of the case", and that following this lengthy deliberation, the young man was admitted to the Hospital as its first patient. He was treated successfully and entirely cured of his ailment. That this latter must have been true is evidenced by a further notation to the effect that he became successful in life "and acquired a property of ten or twelve thousand dollars."

The event of the three-hour consultation by a committee of physicians prior to the admission of the Hospital's first patient could be considered as the first meeting of the Ambulatory Clinic. The Committee, and later the admitting physician, each fulfilled what was to be for many years the primary mission of the clinic — that of selecting suitable patients for admission to the Hospital wards. That any further service than this be offered to the community was apparently not thought justifiable until many years later. However, as time passed, it occurred to many members of the Hospital staff that certain patients might be better treated on their feet than in the iron-posted beds of the Bulfinch wards. Accordingly, a facility was established and the admitting physician was charged with the additional duty of providing ambulatory care to those members of the community who could come to the clinic for diagnosis and treatment. This decision on the part of the Board of Trustees resulted in an immediate and rapid growth of the Hospital's patient census and undoubtedly established the basis on which the clinics of today operate.

To elaborate in detail on the changes in character which the clinic underwent during the hundred years following these early days will not be attempted. It is enough to acknowledge that change took place as needs became apparent. Medicine and surgery, and later the various specialty clinics, were partitioned off from the original clinics as these services became established in the Hospital itself. Follow-up clinics were established, and the practice of accepting difficult cases from referring physicians for diagnosis and advice was extended. Not the least of these changes was a semantic one, wherein the name of the clinics was changed from the "Outdoor Department" to the "Out-Patient Department", and finally to the more recent and resounding title of "The Clinics of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary".

Though all this change was vigorous and healthy, careful examination of the growth and development of the ambulatory clinics leads to several unhappy conclusions. First, it is evident that the development of the clinics as units for patient care has always lagged behind similar developments in the Hospital itself. Second, it is equally evident that the clinics have always been regarded as appendages, necessary and even useful, but nevertheless appendages of the Hospital. Even today, a critical appraisal of current clinic practice leads the observer to the candid admission that in the Hospital setting there exist two standards of medical care. The ease with which the inpatient and his physician can make use of the total resources of the Hospital is in striking contrast to the difficulties which beset the clinic patient in his effort to obtain medical care. Nor does our present clinic arrangement equal the facility with which patient and private physician approach ambulatory care in the office setting. It is with these problems that we are now concerned. Happily, some progress can be reported and should be acknowledged as being the result of the labors of many individuals from both the administrative and professional services. Although we are primarily concerned in this report with the Medical Clinic, it should be pointed out that the advances made in this one area could not have been accomplished without the enthusiastic support of members of the other services.

Recent changes

The first indication that the whole problem of ambulatory care might be reevaluated came in April 1951, when the incoming Chief of the Medical Services stated in his letter of acceptance that he intended to emphasize the need for ambulatory medical care. Soon thereafter, the General Director reported that the Board of Trustees and he were equally mindful of the Hospital's obligation in this area and the existence of this as yet unfulfilled community need.

With this accord on the part of both administration and professional staff, a plan of procedure was evolved. Among the first changes evident to the casual visitor were those related to appearance. The hallmarks of the old Out-Patient Department were drab walls and floors, seemingly endless rows of hard wooden benches, and an atmosphere which was cheerless at best. Today, with the new floors and wall paint and the islands of bright new chairs and sofas, some of the gloom has been dispersed. There is more to be done, but these beginnings brought with them a gratifying change in atmosphere.

New Director

It was apparent to both the administration and the professional staff that there was need for a full-time Chief of the Medical Clinic. Fortunately for the clinic, Dr. John D. Stoeckle was about to finish his tour of duty with the Army Medical Corps and accepted the new position to begin in February 1954. Dr. Stoeckle brought with him much of his well-remembered enthusiasm and a keen sense of awareness of the needs of patients. With Mr. E. Michael White and Miss Ruth M. Farrisey, his administrative counterparts, Dr. Stoeckle has already accounted for an impressive list of improvements.

Records

No ambulatory clinic can effectively operate unless the patient, his record, and his doctor come together at the same time. This requires a well-equipped and efficient record department. The administration has recognized this as a problem area and is currently installing a new open-shelf filing system which, when completed, will benefit everyone requiring the services of an efficient record room. When this work is finished, it will rest with the attending physician and the patients to make the system workable.

Reception of patients

Each morning a hundred or more patients wish to see a doctor. Every admission involves a number of administrative procedures which precede the actual reception of the patient by his physician — an interview to determine basic eligibility, the preparation of a unit record, and payment of the clinic fee. In times past, an attempt was made to accomplish both the administrative reception of the patient and professional care by the attending physician during the same morning. As might have been expected, the task of providing care for an unannounced number of patients posed its problems. In order to separate the registration activities from medical care, the following measures have been instituted:

1. The Medical and Neurology Services have each assigned a resident admitting physician who is responsible for the professional reception of the patients. They assess the urgency of a given prob-

lem and decide on whether admission to the Emergency Ward, Over-Night Ward, the Hospital wards, or an appointment for the clinics is in order.

2. The admission interviews have been improved, with the view of being shorter and more objective; also, patients can be admitted directly to the clinics providing they fill out and return by mail a pre-registration form. Many patients are recipients of welfare and disability assistance. The agencies responsible for such "third-party" payments can also make arrangements for direct admission of their patients.

3. For years, admission to the clinics was restricted to patients from certain localities, though the number of patients seeking admittance never justified such restrictions. The present policy of admitting all patients seeking medical care is a much wiser one, in that it permits the Hospital to discharge more fully its responsibility to the New England community.

4. Lastly, the recent admitting practice permits admissions throughout the day rather than limiting the hours to 8:00 to 10:00 A.M. — a measure which has cut down on the long morning queues.

Cost

The job of providing medical care for patients admitted to "The Clinics of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary" is a sizable one. In 1954 there were 181,774 patient visits. Though it is stated that the charge will be cost, minus professional fee (with the distinct understanding that no one will be turned away because of inability to pay), the basic clinic fee comes to $2.50 per visit! This past year the cost of laboratory charges has been separated from this basic clinic fee, thus permitting the Hospital to collect the amount specified for such examinations by the Welfare and other agencies. Thus, one cannot claim that the clinics provide cheap medical care. To the patient, the total cost is much more; he must take into account his loss of wages, the cost of travel, and other expenses incurred each time he visits the clinics. These constitute no small sum, considering his weekly wage.

"Cash on the line" is the present clinics' policy. This is a cumbersome arrangement, particularly so when the taking of an electrocardiogram or other test on the second floor necessitates paying for the same in the basement before these services are rendered. However, progress aimed at correcting this unnecessary inconvenience can be reported. The administration has already introduced a system of credit (bills) for routine laboratory work, and billing methods are being explored for payment of all diagnostic measures and all medical care procedures.

Appointment system

The administration and the staff of the clinics have done an excellent job in introducing the simplest type of appointment system — scheduling patients in blocks. Although this has required considerable patient education, it seems to work — the "new appointment patient" coming to the Medical Clinic arrives on time and is ready to meet the doctor, though often the latter is not as punctual as is the patient. This important aspect of clinic functioning requires still more doing, more patient education, and more explanation to those who advise the patients to come to the clinic.

Diagnostic facilities

In order to operate efficiently, the clinics must have certain basic diagnostic facilities on their own premises. Here, too, some progress has been made. The clinical laboratory now operates on a full-time basis, as does the electrocardiographic station. These two simple innovations have increased the operating efficiency of the clinics immeasurably.

Staff participation

Service in the clinics has been looked on in recent years as somewhat of a chore. The patient census in the Medical Clinic has remained high, while the number of staff members who were active participants in ambulatory care has not increased proportionately. As a consequence, the patient load per physician has been excessive. No conscientious physician can utilize his best judgment in caring for sick people if he is constantly pressed for time and is forced to see more patients in a given morning than he habitually does in his office; nor does the patient leave the clinic with the feeling that his doctor has been thorough and sympathetic under these circumstances.

To be able to report a change in this area is most gratifying. During the past eighteen months, medical staff participation in ambulatory care has increased over fifty percent. As a result, each physician has been able to do a more thorough, less hurried examination of those patients assigned to him. Of all the changes so far reported, this one is the most heartening, because it reflects the willingness of the staff to meet a long-overdue obligation.

Future plans

The preceding paragraphs have outlined perhaps too briefly the many steps which have already been taken to improve ambulatory care. They are important beginnings because of the many who contributed and because of the concrete evidence that improvements can be made. Often the Massachusetts General Hospital has been referred to as a "venerable" institution; however, equally often this phrase implies little more than "having reached an advanced age". That both the administrative and professional staff have shown a healthy willingness to modify and experiment is an indication that the Massachusetts General Hospital is cognizant of the need for change.

Change to date has been accomplished within the framework of an old building, outmoded facilities, and limited space. Future plans must inevitably include a really modern facility for the clinics. A new building, spacious and properly designed, is a requirement high on the list. If the usual principles of organization are followed, the type and location of most diagnostic and therapeutic facilities become self-evident. It is already apparent that the high patient census on the Hospital wards has overburdened existing diagnostic facilities so that the ambulatory patient who is usually less critically ill comes off second best in his access to these areas. The administrative processing through which the patient must pass before receiving medical care needs centralization, space, and geographical nearness to the patient care area. Other equally important branches of an ambulatory care unit such as social service, dietitians, secretarial service and so on, need to be so located that they have easy access to the patient care area in the same building. Reception and waiting areas, cafeterias, and perhaps a diagnostic ward for the ambulatory patient need consideration.

Another quite different but intimately related problem is that of full utilization of the clinics as one of the many teaching units within the Hospital grounds. A new and efficient clinic building should have incorporated in it the facilities needed for continued education of medical students, house staff, and attending physicians. The opportunities for teaching with ambulatory patients can equal if not excel those for ward teaching.

Final objectives

The major objective in future planning for ambulatory care is to eliminate the double standard of practice which now exists between in-patients and out-patients. We hope there will be but one Medical Service which will be responsible for both patients in the Hospital beds and patients on their feet, that both categories of patients will have the same ease of access to the many resources which the Hospital has to offer, and that the professional staff will participate fully in all of the Service activities. If these simple objectives are kept clearly in mind, there is little need to further justify the plans outlined here.

The Medical Services

* * *

Dr. Howard B. Sprague has recently been appointed a member of the National Advisory Heart Council. The Council is a fifteen-member group composed of outstanding leaders in medicine, science, education, and public affairs, and was established by the National Heart Act as official Advisory Board for the National Heart Institute.

The Council reviews requests from non-federal institutions and individuals for research and teaching grants in the field of diseases of the heart and circulation. The group is a recommending authority for these grants, which are awarded from funds appropriated by Congress by the Surgeon General after they have been recommended by the Council for approval.

* * *

Dr. Kurt H. Thoma, past Chief of our Dental Service, gave the Chalmers J. Lyons lecture before the American Society of Oral Surgeons in Los Angeles on October 13, and received the Society's award "in recognition of his outstanding and distinguished contributions to the art and science of oral surgery". Dr. Thoma was also elected an Honorary Member of the Chalmers J. Lyons Academy of Oral Surgery.

Ether Day was observed this year with the customary awarding of Service Pins. The occasion took place in the Moseley Rotunda, with Dr. Clark acting as master of ceremonies and awarding the pins. Mr. Francis C. Gray, Chairman of our Board of Trustees, made a few congratulatory remarks, and Dr. Walter Bauer gave a brief talk on the polio situation at the Hospital.

Of the nonprofessional group, 93 received pins for 5 years of continuous service at M.G.H., 37 for 10 years, 8 for 20 years, and 8 for 30 years. One 40-year pin was awarded to Mr. William Beckman of the Maintenance Department.

Members of our professional staff who received 25-year pins were Dr. Edward D. Churchill, Dr. Louis Dienes, Dr. Mildred L. Ryan, and Dr. Richard H. Sweet.

Following the ceremonies, refreshments were served in the East Dining Room for the recipients and their friends.

The Board of Trustees, at their meeting on September 30, voted:

To permit Dr. Victor A. Politano to see a limited number of private patients in his office at the Hospital.

To appoint:

Dr. Toivo H. Suutarinen as Fellow in Anesthesia, instead of Assistant Resident in Anesthesia;

Dr. Harold M. Wolman as Assistant in Psychiatry, beginning September 1.

At their meetings on September 28, during October, and on November 2, the General Executive Committee voted:

To promote:

Dr. Mary S. Coley to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1956;

Dr. Robert H. Richie, Jr. to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1956;

Dr. Robb H. Rutledge to the position of Resident in Surgery, effective July 1, 1956;

Dr. David B. Shurtleff to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1956;

Dr. Thomas J. Whitfield, III, to the position of Chief Resident on the Children's Medical Service for one year, beginning July 1, 1956.

To extend the appointment of:

Dr. Norman L. Paul as Clinical Fellow in Neurology, from July 1, 1955 through June 30, 1956.

To reappoint:

Dr. Oswald D. Cinquegrana as Senior Clinical Fellow in Physical Medicine, effective February 1, 1956;

Dr. Sung J. Liao as Senior Clinical Fellow in Physical Medicine, effective March 1, 1956;

Dr. Maurice M. Pechet as Clinical and Research Fellow in Medicine, as of October 1;

Dr. Madan M. Singh as Clinical and Research Fellow in Medicine, for the period October 15, 1955 through June 30, 1956;

Dr. Samuel J. Sunnenblick as Graduate Student Assistant in Surgery for one year, beginning October 3;

Dr. John B. Vander as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Dr. Donald F. Williams as Clinical Fellow in Medicine, rather than Graduate Student Assistant, effective as of October 1.

To appoint:

Dr. John R. Bumgarner as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Arthur C. Cairns as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Felix A. Córdoba as Research Fellow in Surgery (Immunology), as of September 20;

Dr. Dolores R. de Córdoba as Research Fellow in Surgery (Immunology), as of September 20;

Dr. Emilio del Campo O. as Graduate Student Assistant in Medicine, assigned to Cardiology, effective October 1;

Dr. Frank W. Garran, Jr. as Clinical Assistant in Surgery, beginning October 1;

Dr. Morice Hall as Graduate Student Assistant in Medicine, assigned to Cardiology, effective October 1;

Dr. Hunter Heath as Graduate Student Assistant in Medicine, assigned to Cardiology, effective October 1;

Dr. Biriya Hotrabhavananda as Graduate Student Assistant in Medicine, assigned to Cardiology, effective October 1;

Dr. George Martz as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Dr. Yehia Z. Mouhran as Graduate Student Assistant in Medicine, assigned to Cardiology, effective October 1;

Miss Renee G. Naves as Research Fellow in Medicine, beginning December 1;

Dr. Hugo M. Palazzi as Clinical and Research Fellow in Surgery, as of October 1;

Dr. Yvon A. Paradis as Graduate Student Assistant in Medicine, assigned to Cardiology, effective October 1;

Jeanne S. Phillips, Ph.D. as Research Fellow in Psychology, beginning October 1;

Dr. Kenneth J. Ryan as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Dr. Herbert de N. Tucker as Graduate Student Assistant in Medicine, assigned to Cardiology, effective October 1;

Mr. Alvin J. Yorra as Research Fellow in Orthopedic Engineering, for the period October 18, 1955 through June 30, 1956.

◆ ◆ ◆

DEDICATION OF THE NEW NEUROSURGICAL OPERATING ROOM

On Monday, October 10, the new operating room for neurosurgery was dedicated. Need for a specially designed room for this specialty has been emphasized in previous issues of the Massachusetts General Hospital News (December 1951 and June 1954). It was stated in these articles that the standard rooms on White 3 with their overhead galleries are unsatisfactory both for teaching and for modern neurosurgical techniques. It was also pointed out that conduction pathways in the spinal cord and the function of certain areas in the brain concerned with pain, psychological processes, epilepsy, and abnormal movements can only be studied adequately in the course of actual operations. Not only the patient himself, but later sufferers from similar conditions will benefit by wisely planned investigation of this sort. Fortunately, an additional 30 minutes to an hour devoted to electrical recording of nerve impulses in the brain, spinal cord, and peripheral nerves in the course of surgical exposure of these structures carries no added risk or discomfort to the patient, provided certain precautions can be taken. To do this safely and effectively requires: 1) unusually efficient ventilation to prevent infection from air-borne bacteria; 2) having the added personnel required to run the E.E.G. and other electronic apparatus, outside the operating room but where they can see through glass what is going on and where the surgeon can see their recordings; 3) electrical screening in the walls, ceiling, and floors that will keep out interfering radar, radio, and other high-frequency currents.

Thanks to Mr. Willard Simpkins of New York and the family and friends of Mr. Amory Coolidge, who died three years ago, it has been possible to build and equip such a room.

On the occasion of its dedication the neurosurgical staff and Mr. Carleton N. Goff, the hospital architect, were privileged to demonstrate these unusual features of the room to the generous donors. Afterward, in Dr. Dean A. Clark's absence, Mr. Francis C. Gray, Chairman of our Board of Trustees, and Mr. David C. Crockett, Associate Director for Resources and Development at the Hospital, were hosts at a most pleasant luncheon in the Trustees' Room. Mr. Gray expressed the gratitude of the Hospital for such an unusual gift, and Dr. James C. White, as Chief of Neurosurgery, his deep appreciation of this memorial to one of his best and oldest friends. Drs. William H. Sweet and H. Thomas Ballantine described the type of work for which this new theatre is especially constructed, in addition to its advantages for routine neurosurgical operating and teaching.

James C. White, M.D.,
Chief of Neurosurgery

One Monday morning a few weeks ago, Dr. Gilbert Hermann of our house staff came bursting into The News office, waving the Inter-Hospital Tennis trophy over his head. The MGH team had won it back the day before.

After a lapse of 11 years, the Sir Cuthbert Wallace cup No. 2 was put back into contention. A small but enthusiastic group of spectators saw the Massachusetts General Hospital beat the Peter Bent Brigham 3 matches to 2. The matches for the most part were well played, and at times the caliber of play was remarkably excellent.

Things started out well for us when Drs. Gerald Austen and Richard Austin defeated Drs. Burhenne and Goldfein of the Brigham 6-1 and 7-5.

In a hard-fought match, Drs. Cahill and Froesch of Brigham defeated Drs. Gilbert Hermann and Charles Keevil 6-3, 6-3; but the M.G.H. rebounded as Drs. Hermann and Austen then overpowered Drs. Criscitiello and Schlant of the Brigham 6-0, 6-2.

The final issue remained in doubt, as Dr. Cahill of the Brigham sent Dr. David L. Collins down to defeat with 6-0, 6-2.

With the match score tied at 2 all, our Dr. Keevil defeated Brigham's Dr. Froesch 6-2, 12-10 (!) in as good a match as may be seen anywhere this side of the Longwood Cricket Club.

Next year, when the sore muscles have regained their tone and the blistered feet have healed over, the cup — we hope — will be taken down from the shelf in the Archives Room, polished up, and once again be placed out for contention.

[For the interesting stories of the original Wallace cup and the Dr. Harvey Cushing trophy, we refer you to the MGH News issues of November 1944 and April 1954.]

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of The News, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears. For books, give the publisher's name and address.

THERE ARE STILL THOSE WHO FAIL TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Gastrointestinal Research

Spiro, H. M., Ryan, A. E., and Jones, C. M.
The utility of the blood pepsin assay in Clinical Medicine.
New England J. Med. 253:261-266.

Laboratory Science

Matoltsy, A. G., and Balsamo, C. A.
The components of the cornified epithelium of the human skin.
J. Invest. Dermat. 25:71-74.

Neurosurgery

White, J. C., and Adams, R. D.
Combined supra- and infraclinoid aneurysms of internal carotid artery: Report of a case of unusual congenital dilatation of intracranial portion of carotid artery and injuries to visual, oculomotor, sensory, and taste fibres.
J. Neurosurg. 12:450-459.

White, J. C., and Cobb, S.
Psychological changes associated with giant pituitary neoplasms.
A.M.A. Arch. Neurol. & Psychiat. 74:383-396.

A chapter, written by Dr. James C. White and translated into German, entitled "Tecknik der Operationen am sympathischen Nervensystem", has been included in Volume 1 of Burghard Breitner's new loose-leaf *Chirurgische Operationslehre,* published by Urban & Schwarzenberg, Vienna.

A translation into Spanish of White, Smithwick, and Simeone's *The automatic nervous system,* published by The Macmillan Company in 1952, has been brought out by Editorial Artecnica, Buenos Aires.

Ophthalmology

Donahue, H. C.
An exceptional lesion of the orbit.
A.M.A. Arch. Ophth. 54:259-261.

Otolaryngology

Kelemen, G.
Aural changes in the embryo of a diabetic mother.
A.M.A. Arch. Otolaryng. 62:357-369.

Pathology

Castleman, B.
Tumors of the thymus gland.
In Atlas of tumor pathology, Section 5, Fascicle 19, Washington, D.C., Armed Forces Institute of Pathology.

Morgan, W. L., Jr., and Dudley, H. R.
Malignant thymoma and myasthenia gravis: Report of a case and review of the literature.
New England J. Med. 253:625-632.

Miscellaneous

Cass, L. J., Frederik, W. S., and Andosca, J. B.
Methyprylon—A new sedative and hypnotic drug.
New England J. Med. 253:586-591.

♣ ♣ ♣

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

Due to the polio epidemic, the concerts given in the Chapel, which usually begin in the early fall, have been postponed until December.

There is now a very definite need for long-playing records which would be suitable for convalescents to enjoy and also for playing in the Chapel. Dr. and Mrs. Milford D. Schulz have very kindly donated a "hi-fi" set to the Hospital — hence this appeal for records.

Mrs. Jackson M. Thomas wishes to express her thanks for the help she received in making the tea, held on November 17 in Bartlett Hall, such a success. Many Staff Wives and foreign visitors were present.

The exact date of the tea to be held in February will be announced soon.

When the Staff Wives launched their furniture exchange project, they received such a generous supply of items that they wondered when so many pieces would ever be taken away. However, this situation was very quickly altered and their supply of furniture for loan to our visitors from other lands is completely exhausted. So — will all those who have extra mattresses, beds, chairs, tables of all sizes, lamps of any kind, etc., which are stored away or no longer in use, please let Mrs. Richard H. Sweet know about them. If you cannot deliver your contributions to 27 Chestnut Street, Brookline, drop Mrs. Sweet a note to that effect and arrangements will be made to have them collected. All articles that have been received to date have been most gratefully accepted and used.

Our Reception Centre is going along smoothly. The work has proved interesting, enjoyable, and rewarding for the Staff Wives, as well as for the visitors from other countries who come to us for assistance.

Regular weekly volunteers are still very much needed.

Membership in the Staff Wives group is open to wives of permanent members of the staff of the Hospital, also to Clinical Assistants' wives and any other women who are in sympathy with our aims and projects.

MASSACHUSETTS EYE & EAR INFIRMARY

At the meeting of the American Academy of Otolaryngology, held in Chicago on October 8-14, there were 5600 people registered. A highlight of the meeting was a film, sponsored by the Academy, on "The development of the ear". This film, the first of its kind, will be available to medical schools and otolaryngology groups throughout the country.

Representing the Infirmary on the ENT Board of Examiners were Drs. Schall, Meltzer, Mueller, and Reed. During the Board examinations, a memorial dinner was given for Dr. Harris Peyton Mosher, former Chief of Otolaryngology at the Infirmary.

Banquets were held by both the Eye and ENT alumni of the Infirmary. There were 49 ENT alumni present from such far-off places as Hawaii and Canada, as well as from all parts of the United States, to hear Dr. LeRoy A. Schall speak on the progress of the Infirmary in the last 15 years and the plans for the new Research Building. It was decided to hold a joint banquet for both the Eye and ENT members at next year's meeting.

It was interesting to note how many men who have had residencies at the Infirmary are now giving instructional courses at these annual meetings. They represent every phase of Otolaryngology, and their courses are usually given to capacity audiences. Among the former residents who conducted instructional courses at the October meeting in Chicago were: Dr. Lawrence R. Boies of Minneapolis, Dr. John M. Converse of New York City, Dr. Gordon D. Hoople of Syracuse, Dr. Percy E. Ireland of Toronto, Dr. Clair M. Kos of Iowa City, Dr. Frederick T. Hill of Waterville, Maine, Dr. Mercer G. Lynch of New Orleans, Dr. George E.

Shambaugh, Jr. of Chicago, and Dr. James A. Moore of New York City.

The Winthrop Foundation has begun a course on "Hearing testing", which is being offered to doctors' nurses and secretaries. The course will enable the nurse or secretary to relieve the doctor of routine details and certain special testing. Among the areas to be covered are: basic types of hearing loss, routine air conduction audiometry, screening for quick tests, bone conduction testing, masking, recruitment testing, speech testing, and techniques for testing special problems. The course will be given by Mr. Alan Feldman, audiologist at the Winthrop Foundation.

Dr. LeRoy A. Schall and Dr. Trygve Gundersen have participated in one of New England's largest medical sessions. It was held at Bretton Woods, New Hampshire, September 29 through October 1, on the occasion of the sixth annual meeting of the New Hampshire and Vermont State Medical Societies.

Dr. David G. Cogan, Director of the Howe Laboratory of Ophthalmology, has been appointed to the National Advisory Neurological Diseases and Blindness Council. This Council makes recommendations to schools on research grants in the fields of neurological and sensory disorders and in diseases causing blindness and deafness.

Awards of research grants to seven members of the Massachusetts Eye and Ear Infirmary staff have been made by the National Institute of the U.S. Public Health Service. Recipients are Dr. W. Morton Grant of the Howe Laboratory for work on glaucoma, and four members of the Retina Foundation — Drs. Charles L. Schepens, Endre A. Balazs, Marie A. Jakus, and Laszlo Varga. Awards were also given to Dr. Merrill J. King for his study on "Retrolental fibroplasia", and to Dr. Robert S. Gohd for "the isolation, detection, and study of the common cold virus".

Miss Madeline Shipsey, Casework Supervisor at the Infirmary, discussed "Field work teaching of social work students in a medical setting" at the 50th anniversary meeting of the Social Service Department of the Massachusetts General Hospital, held October 20-22.

Dr. Helio Hungria, an otolaryngologist from Rio de Janeiro, Brazil, observed the work in the Otolaryngology Department from October 1 to 22.

Dr. Nagid Saad, a State Department guest from Lebanon, visited the Retina Service in October, to study the detached retina operation.

The following votes were passed at a meeting of the Board of Managers of the Infirmary, held on October 5:

To accept with regret Dr. Charles I. Johnson's resignation as Surgeon and to appoint him as Consulting Surgeon in Otolaryngology.

To promote:

Dr. Walter J. E. Carroll to the position of Surgeon in Otolaryngology;
Dr. John E. McKeigue to the position of Associate Surgeon in Otolaryngology;
Dr. George F. Reed to the position of Assistant Surgeon in Otolaryngology.

New addresses:—

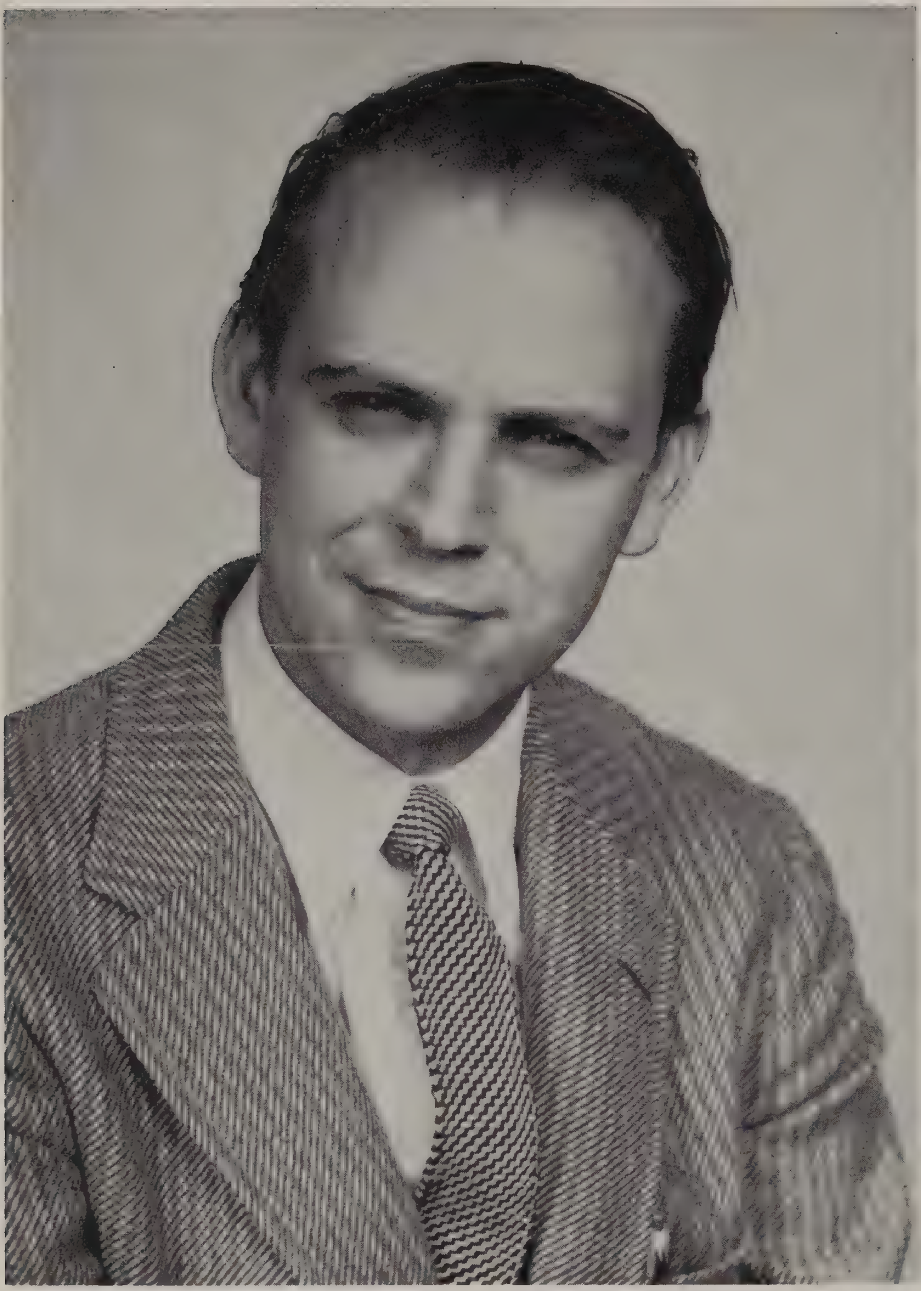
Dr. Leo B. Burgin (*C.M.* 1932), 151 Kent St., Brookline 46, Mass.
Dr. John O. Esslinger (a.r.s. *Or.* 1952), 76 West Adams Ave., Detroit 26, Mich.
Dr. Norman E. Freeman (r.s. *W.S.* 1935), Suite 418, 490 Post St., San Francisco 2, Calif.
Dr. Felix G. Freund (fel. *An.* 1955), 755 Mitre, Lomas de Zamora, Argentina
Dr. Pierre J. Gauthier-Lafaye (fel. *An.* 1953), SP. 58.418, French Forces in Germany
Dr. John H. Kennedy (*S.* 1950), 850 Prospect St., La Jolla, Calif.
Dr. Gordon M. Morrison (*Or.* 1941), 77 San Mateo Drive, San Mateo, Calif.
Lt. Henning Pontoppidan, MC, USAR (a.r.p. *An.*), U.S. Army Hospital, Fort Ord, Calif.
Dr. Kirk H. Prindle (*N.* 1926 & *W.S.* 1928), 23 Baldwin St., San Mateo, Calif.
Dr. Howard Rasmussen (*M.* 1953), University College Hospital, London, England
Lt. Leonard J. Rothfeld, MC, USAR (a.r.p. *An.*), USAH, 8169th AU, Camp Zama, APO 343, c/o Postmaster, San Francisco, Calif.
Dr. Raymond D. Sphire (a.r.p. *An.* 1955), Grace Hospital, 4160 John R. St., Detroit 1, Mich.
Dr. John O. Strom (r.p. *N.P.* 1955), National Hospital, Queen Square, London, England
Dr. Eji Suyama (*S.* 1951), Veterans Administration Hospital, Syracuse, N. Y.
Dr. Malcolm K. Sykes (fel. *An.* 1955), 11 Clystlands, Topsham, Devon, England
Dr. Roger E. Wilcox (*S.* 1949), Beckley, W. Va.

Brief bits:—

On a recent trip to Texas, Dr. Edwin F. Cave delivered two lectures at the meeting of the Texas Academy of General Practice, held in Fort Worth. His subjects were "Injuries to the wrist" and "Derangements of the knee". In Houston, he addressed the Houston Orthopedic Club on the subject "Nonunion of bone", and he was given a luncheon by the Harvard Medical Association of Houston.
At a joint meeting of the Buffalo Surgical Society and the Cleveland Surgical Society, held recently in Cleveland, Dr. Edward D. Churchill gave an address on "The education of the surgeon". M.G.H. was well represented by Drs. Donald M. Glover (*W.S.* 1922), George H. A. Clowes, Jr. (a.r.s. 1948), and Fiorindo A. Simeone (*W.S.* 1936).
Dr. Stanley Cobb gave the Introductory Address at the opening of the Renard Hospital, Washington University, St. Louis, on October 10.
Dr. James H. Currens spoke before the Illinois Academy of General Practice, in Springfield, on October 27. His subject was "Drug treatment of hypertension". He also participated in a panel discussion on the same subject.
Dr. Chester M. Jones has been appointed Chairman of the American Board of Internal Medicine for the year 1955-1956.
Dr. J. Gordon Scannell addressed the Middlesex North District Medical Society on October 19. His subject was "Concepts of cardiac surgery". On November 2 he gave a talk at the Veterans Administration Hospital of Manchester, New Hampshire, on "The practical application of laboratory tests in evaluating patients for cardiac surgery".
Dr. William R. Waddell addressed the Massachusetts Trudeau Society on October 27. His subject was "Cholesterol pneumonitis".

Dr. Edward P. Richardson, Jr. was granted leave of absence last June for the continuance of advanced studies in neuropathology at the University of Giessen with Professors Hallevorden and Spatz, and to visit other neurological centers in Germany. This delightful letter from Dr. Richardson to his family over here has been passed on to us. It was written in October and reads, in part:

We have been doing all sorts of interesting things lately. Perhaps I should mention first our visit last week to Frankfurt, which was an outstanding occasion. While in London, at the Neuropathology Congress, I met Professor Wilhelm Krücke and his wife. He is a very competent neuropathologist, whose work on the pathology of peripheral nerves was mentioned to me by Dr. Raymond Adams even before we left home. He invited us to visit him in Frankfurt when we had a chance. The chance came last week. We drove to Frankfurt (a special trip of about an hour in the autobahn) and were cordially received by Frau Krücke at their home in the southern section of Frankfurt, across the River Main from the central part of the city. They are people of vigorous early middle age, just as friendly and cordial as they could be, with two daughters of about 13 and 15. We had lunch with them there, and in the afternoon Peggy and Clara [Mrs. Richardson and the Richardsons' daughter], with Frau Krücke and her younger daughter visited the excellent Frankfurt Zoo. Meanwhile, Professor Krücke showed me his Institute and some of the fascinating peripheral nerve material he is working on. He is Chief of the Edinger Institute of the Frankfurt University—a neuroanatomical-pathological department which is housed in the Pathology Building of the University Hospital. Ludwig Edinger, for whom the Institute is named, was a famous neuroanatomist of the early part of the century, whose chief contributions were in the field of comparative neuroanatomy. He gathered together in his active life an unparalleled collection of specimens, slides, and literature reprints, all of which are now capably cared for by Professor Krücke—under whom the Institute, after a period of inactivity under the Hitler regime and the war, is again a flourishing research center. Professor Krücke is an unusually fine person, as well as scientist, and he could not have been more friendly to me. He devoted hours of his time showing me the Edinger collection, his own material, and discussing various points as they came up. In the evening, we had dinner at the Krückes', and then were treated to a color-photo show of pictures taken of Professor Krücke recently in England, France, and Belgium. We were comfortably installed for the night in the guest room of the Institute, and the next morning Peggy and Clara went shopping while I spent some more delightful and profitable hours with Professor Krücke. We then took our leave, had lunch in town at a remarkable café where there were innumerable cages and tanks containing fish, parrots, lizards, and even a family of marmosets. Then more shopping, and finally a leisurely trip back to Giessen, during which we had a look at the imposing medieval fortress at Freiberg, with its tall and very handsome tower, and had a quick visit to the fountain court (hot springs) and park at Bad Nauheim. I should have mentioned that while we were in Frankfurt, we visited the Goethe house with Frau Krücke—a splendid example of a prosperous middle-class house of 200 years ago, where Goethe was born and spent the early part of his life. Although destroyed by bombing, it has been perfectly reconstructed and, fortunately, all the interior furnishings were preserved from dam-



No. 55 in a series of Staff photographs

Dr. John D. Stoeckle, Assistant Physician and Chief of the Medical Clinic

age. Clara was particularly interested in some old clocks there which had pendulums and pleasant chimes. Unfortunately, our time was rather limited, so we could get only a quick impression. As you can imagine, the house, together with the appended Goethe museum next door, could well justify many hours of perusal.

Recently, I have made a couple of unusual excursions on my own. First, I was invited by Frau Spatz to attend some of the music festivals in Kassel—an annual event sponsored by people interested in music, for families and similar home groups. Two weeks ago I traveled to Kassel on the train with Dr. Lieper (Professor Spatz's senior assistant) and Liv, the Spatzs' oldest daughter. We were met there by Frau Spatz, who had been attending the previous meetings over the week end, and then went to the auditorium, where we heard some very modern music for voice, and ancient (viols and block flutes) and modern (string and woodwinds) instruments. In the afternoon there was a lecture and demonstration which interested me particularly. This had to do with an attempt to reconstruct brass instruments of the baroque period and earlier, for the purpose of using these with voices and instruments of other types in the way that was customary in those days, apparently. The aim, therefore, was to construct brasses of such characteristics that they would not drown out a solo singer, or block flute group, but would instead blend in and enrich the effect by adding their own tone-color. Thus, we heard and saw trumpets and trombones built according to measurements of some instruments in several museums. The trumpets were equipped with valves, and thus modernized, so that they could be used for practical purposes by players without the specific technique of the Bach trumpet. The trombones had very small bells, and were made with narrow-bore tubing. The mouthpieces, we were told, were likewise somewhat different from those in present use. The result of these modifications was that these instruments were indeed very soft and gentle in tone and not penetrating or assertive. For contrast, there was another group of instrumentalists on the stage who played the modern brass instruments. It was a most interesting comparison. I should think these new-old instruments would have many possibilities for chamber performances and for bass choirs in church services, but they are rather too thin and insubstantial in tone for orchestral purposes. I was not immediately spurred to rush out and buy one of these modified trombones, interesting though they are, but I shall want to keep an eye on future developments.

We spent the night in a Jugenherberge (youth hostel), and that was interesting in itself. Dr. Lieper and I occupied a double-decker bunk in a fairly large, bare room, containing perhaps 15 to 20 such bunks. Some of our ski lodges are very similar. Everything was very simple, but neat and clean and entirely adequate, and we spent a most comfortable night. We returned to Giessen by air the following day.

The other independent trip I made was early last week, with my colleague in the Neuropathology Abteilung, Dr. Spaar. We went to visit Haina, a former monastery which is now a State mental hospital. Haina is perhaps 20 mm. or more northeast of Marburg, at the edge of a vast forest, and has a beautiful situation in the confluence of some small valleys. Its pride is a vast early Gothic church of astounding size and very handsome appearance. When Landgraf Phillipp von Hessen took up the cause of the Reformation, he converted Haina from a monastery to an institution for the sick and the aged. In more recent years it became a mental hospital and is now a very good one, I should say—well run and forward looking. At the same time, it is a monument of great cultural and historic importance, for most all of the old monastery buildings are preserved and in excellent condition. Some of these buildings serve the hospital for wards, library, conference rooms, etc., and have been reconstructed internally in such a way that modern needs are served without destroying the character or effect of the old construction. The church is not used for religious services at present (instead, there is a smaller non-denominational chapel in what was the refectorium), but has been cleaned up inside by removal of unnecessary and disfiguring paint on the roof and walls, and may be used for concerts of religious music.

Yesterday we had a splendid day with our friends the Kellers. We drove to Schiffenberg (the remains of a Benedictine monastery just outside Giessen, where there is a Romanesque church). It was a beautiful afternoon—cool and bracing, but with some pleasant sunshine—and we had a walk in the woods and fields near by. The Kellers have two little girls—one older and one younger than Clara—and the children had a wonderful time together.

This week we are off on another trip, this time to the Pfalz. My friend Engelhardt is giving a lecture there which I want to hear, and afterward we are invited to visit his in-laws in Landau. In another couple of weeks we go to Heidelberg again, and before we leave I hope we shall go to Munich to the Institute there.

We are seriously thinking of staying here for Christmas. The celebration of Christmas in Germany is something so special and unique, and it would be good to have a chance to participate in it—a chance that might never come again. I should think that we would then, a day or two later, return home by plane from Frankfurt. I am determined that we shall all be together again before New Year's day.

* * *

A few weeks ago we happened to see an unpublished poem by Dr. Carl Binger, Consulting Visiting Psychiatrist on our staff. The magic of its symbolism has persisted since then, and we were most grateful to Dr. Binger when, in response to our request to use it in The News, he granted us his permission. Here is the poem:

CHRISTMAS MORNING

The yellow light of sunrise breaks the
white and frosted air.
Across the yellow ice step three white
swans.
Clothed in blue and ermine, crowned with
light,
They move toward the bright East,
Offering the gift of beauty
To the miracle of a new day.

THE NEWS

No. 152 Boston, Mass. January 1956

Ever since "The poliomyelitis story—Massachusetts General Hospital—1955" appeared in the November issue of THE NEWS, letters and telephone calls have continued to come to the Hospital, expressing admiration and appreciation of the role played by the MGH family during the emergency. The following letter from Mr. Thomas Stotler, State Representative of the National Foundation for Infantile Paralysis, Inc. to Mr. Francis C. Gray, Chairman of our Board of Trustees, is an example of what we mean.

> During the worst polio epidemic in the history of Massachusetts, it was our privilege to have played a small role with the great Massachusetts General Hospital in helping to meet the emergency. The efforts of your hospital in facing this problem will always stand out in our memory as an example of the highest tradition of medicine.
>
> Between the months of July and October we were in daily contact with many of the staff of the Massachusetts General Hospital. The devotion of everyone to the welfare of the polio patients was impressive to us and reflected the greatest credit to them, the Massachusetts General Hospital, and the medical profession.
>
> Based upon our experience in working with your institution in the past and during this polio epidemic in particular — we believe that nothing in the field of public health is impossible when great institutions such as yours work hand in hand with a volunteer health agency such as ours.

DEDICATION OF THE NEW ALBRIGHT AND JONES LABORATORIES

An informal dedication of Dr. Fuller Albright's and Dr. Chester M. Jones's laboratories took place on November 8, on the fourth floor of the Bulfinch Building.

At twelve o'clock a group of twenty-five friends of Drs. Albright and Jones, who came by special invitation of the Trustees, met briefly in the Trustees' Room and then went directly to the laboratories. This small group was selected from former patients and personal friends, outside the Hospital family, who had helped to support research at the Hospital. However, it was arranged that members of the Hospital family could meet with the invited guests in the laboratories, where the current research program was explained by members of the staff.

At one o'clock a luncheon was given by the Trustees in the Doctors' Dining Room. Because of the limited capacity of the room, only those guests who had come from out of town could be invited to the luncheon. Mr. Ralph Lowell, Chairman of the Building Committee of the Board of Trustees, presided. Dr. Dean A. Clark, General Director, spoke briefly about the history of the work of Drs. Albright and Jones in the Hospital; and Dr. Walter Bauer, Chief of the Medical Services, outlined the scientific development of their research program in the Hospital.

After the luncheon, the laboratories were open to visitors during the afternoon.

BIOLOGICAL LABORATORY

The Biological Laboratory, perhaps better known as the Albright Lab, had its beginning in a corner of the Chemistry Laboratory in 1929 (then located on the top floor of the Bulfinch Building). Dr. Fuller Albright had just returned from a year's study with professor Jacob Erdheim in Vienna (who, according to Dr. Albright, knew more about bone structure, normal and abnormal, than any other person) and wanted to pursue his long-standing interest in calcium and phosphorus metabolism. Dr. James Howard Means, then Chief of Service, offered Dr. Albright a small space next to the Chemistry Laboratory with the understanding that Dr. Albright would in return supervise the tests then being carried out there. Dr. Means said he appreciated the fact that this laboratory was not satisfactory because of the run-down state of that section of the building, but he hoped, although he could not promise, that within two years it would be remodeled. (He did not intimate that the previous occupant of the quarters had been much troubled by the leaky pipes overhead.) Actually, 25 years were to elapse before the Chemistry Laboratory was moved to new quarters and Dr. Means's hope of a better laboratory was realized.

While he was abroad, Dr. Albright had witnessed the laying of an important cornerstone in endocrine investigation, as Professor Bernhard Zondek of Berlin had injected pituitary glands from animals into infantile rats, and almost over night had turned these rats into sexually mature rats. Almost simultaneously, Dr. Phillip E. Smith and Dr. Earle Engle performed the same experiment in the United States. Shortly thereafter, Zondek and Aschheim devised the first biological test for pregnancy. These studies, showing that the pituitary contained hormones which controlled the development of the male and female gonads, opened up new fields in endocrinology. Dr. Albright took the first train to Berlin to see these new developments.

In the fall of 1929, the Biological Laboratory of the Massachusetts General Hospital was ready, and the rabbit test for pregnancy was undertaken. At that time the technical help consisted of Dr. Jessie Reed Cockrill and Mrs. Elizabeth Cloney Thompson. Dr. Perry C. Baird, Jr., who was interested in pituitary physiology, also assisted at this time. Research concerning the glands of internal secretions was under way in the Bulfinch Building.

When Dr. Joseph C. Aub left the Massachusetts General Hospital in 1929 to go to the Huntington Memorial Hospital, he left behind a well-organized project to study the ins and outs, the doings and undoings of calcium in the body. The study would have naturally fallen into the hands of Dr. Walter Bauer had he not been committed to a large program to study arthritis. Dr. Albright and those associated with him took over this project and started to work. Papers soon began to appear which were the results of the efforts of Dr. Aub and Dr. Bauer (who had not lost their interest in the work in which they had participated), Dr. Marian W. Ropes, and Miss Elsie Rossmeisl.

In 1934, Dr. Hirsh W. Sulkowitch arrived and took over some of the supervision of the Chemistry Laboratory. He contributed "Sulkowitch solution", a valuable aid to the clinician in estimating calcium concentration in the urine; and he, with Dr. Albright, also concocted "Solution G" which is used in dissolving certain types of kidney stones.

About this time, as an outgrowth of the work on parathyroid physiology, the problem of kidney stones had begun to occupy the attention of the group. Dr. J. Dellinger Barney, then Chief of Urology, obtained a small amount of money for the study of kidney stones. The study led in several directions. All stones are not made of the same thing. It soon became apparent that the problem had to be worked out separately for each kind of stone. Research technician Robin Murdock started the job of determining the chemical composition of stones. The Albright Laboratory has stones from all over the world, the present serial number being 3627. Dr. Howard I. Suby, at that time a Resident in Urology, showed great interest in this work. The reason for this interest became more apparent when Robin and Howard announced their engagement and formed the research team of Suby and Suby, whose laboratory work was subsequently interrupted by the onset of World War II and later by the arrivals of Eric, Janet, John, and Sara. Also interrupted by the war was the work of Dr. Max Rosenheim, who had come over from England. Miss Eleanor Dempsey then joined the group. She was appointed "temporarily" in 1939 and is still working in the Albright Laboratory. Indeed, she is the moving force of the laboratory, being able to take over any of the various procedures in time of necessity. In the stone analyses she is ably assisted at present by Mrs. Mary Cabral. All this time metabolic studies had been in full swing on Ward 4, and Mrs. Leo Gordon (Esther Bloomberg) had been doing the meticulous determinations of calcium and phosphorus in body fluids which were so important a feature of the data upon which the Albright group stood or fell at the "spring meetings" in Atlantic City.

While these investigations were being carried out, Dr. Patricia H. Benedict (Patricia H. Smith) had busied herself with a method for testing one specific hormone from the anterior lobe of the pituitary. This test measures in the urine the follicle-stimulating hormone (FSH). It tells whether the pituitary is making too much (as is the case in the menopause), the right amount, or too little of this particular hormone. Mrs. Elizabeth Dodge assisted with this test. The test has been invaluable in sorting out errors in hormone production, especially in distinguishing between a primary gonadal dysfunction and a gonadal dysfunction secondary to pituitary disease. An example of the value of the test is found in the elucidation of the hormone pattern in ovarian agenesis, a condition associated with short stature and absence of ovaries. This has been considered to be due to a lack of growth hormone of the pituitary to stimulate growth, and a lack of FSH to stimulate the ovaries. The FSH test showed not too little FSH, but too much; the pituitary was doing its best to make an ovary, which was not there, function. Among those who applied this measuring stick was Dr. Russell Fraser from England. He also demonstrated the value of intravenously administered insulin in the diagnosis of endocrine diseases, and still found time to be interested in ovarian agenesis.

Dr. Anne P. Forbes assisted Dr. Russell Fraser with the 17-ketosteroid assay; they were joined by Mrs. Gordon Donaldson (Elizabeth Craighead). The number of 17-ketosteroid determinations done by this laboratory, as of November 9, 1955, is 18,323. This test added another item to the armamentarium for evaluating endocrine function of both the male gonads and the female and male adrenal (androgenic hormone).

At this point nearly everyone in the laboratory took part in another project related to adrenal function, namely the measurement of the growth of axillary hair measured in milligram per axilla per week.

Miss Grace Griswold had come to this laboratory late in 1937 to do pregnancy tests, and soon became responsible for all the biological tests. Dr. Harry L. Klinefelter and Miss Griswold then began to improve the FSH test and soon the hormonal disorder in a condition in males characterized by infertility and enlargement of the breasts (gynecomastia) was recognized; later came the sorting out of the various types of eunuchoidism, both male and female.

With the coming of World War II, metabolic investigation into the effect of hormones on wound healing took first priority. Dr. Edward C. Reifenstein, Jr. supervised these studies on Ward 4. Miss Dorothy Bryant, who had come in 1940, assisted in this work. Over the next four years, Dr. Frederic C. Bartter and Dr. Laurance W. Kinsell took part. Miss Evelyn Carroll arrived in 1946 and first took over the 17-ketosteroid determinations, later the calciums when Miss Bryant became Mrs. Ralph Nodine.

The physical state of the laboratory had indeed worsened by this time. Miss Griswold was found late one afternoon giving the mice their last injection of the day, standing with hat and coat on, underneath an umbrella, to keep the rain off because of a leaking roof overhead. Temporary repairs were made, and the work was carried on.

As the war drew to a close, Dr. Philip H. Henneman began to be actively interested in the Ward 4 projects; and Dr. Harold E. Elrick and Miss Jeanne Brenner began a survey of laboratory methods then in use, with an eye to improvement of certain techniques. With the war over, colleagues from all parts of the world were free to travel here and spend some time with us. Among these were Dr. Gilbert Gordan and Dr. Felix Kolb, both from California. From England came Dr. Paul Fourman, Dr. Victor Coxon, and Dr. John B. Dawson. Dr. Nils Tornblom came from Sweden. More recently, Dr. Martyn Lloyd, from England, Dr. W. P. U. Jackson, from South Africa, and Dr. Helen Thomopoulo, from Greece, did investigational work in the laboratory.

By this time it became evident that the day of reckoning had arrived as far as the state of disrepair of the laboratory was concerned: the hoods no longer carried away irritating fumes, and metal parts of apparatus began to corrode. One could only guess as to what might be going on in one's lungs and trachea! So, at long last, plans were afoot for remodeling. Dr. Henneman worked for one year with Mr. Carleton N. Goff on the plans. One of the major items of importance which at one time occupied an entire morning of Dr. Jones's and Dr. Albright's time was where to locate the ladies' lounge. Dr. Marc Moldawer tried to do some work in the laboratory when the repairs began, but soon his space was needed for storage of equipment. He joined Dr. Roger Melick and Dr. Robert Nielsen in marking time during the waiting period.

Present personnel, in addition to those already mentioned, includes George Boyce, who makes the charts and drawings which are the envy of other investigators who do not have a "George", Evelyn Carroll (calcium and phosphorus and other chemical determinations related to research), Jane Claffey (17-ketosteroids), Mrs. Irma Gramer (FSH tests), and Mrs. Velta Maisins (pregnancy tests).

With the occupation of the new quarters in the spring of 1955 and the coming of Dr. Maurice M. Pechet, there has been an upsurge in enthusiasm to explore new methods.

One of the big improvements which has come out of the rebuilding of the laboratory is the moving of the offices along beside the laboratory.

One final sad note must be faced: the laboratory is too small.

Patricia H. Benedict, M.D.,
Assistant in Medicine

✓ GASTRO-INTESTINAL RESEARCH LABORATORY

Organized work in investigation of the physiology of the digestive tract, as it relates to function or disease, started at this Hospital with Dr. George R. Minot, in whose laboratory I worked for several years from 1920 on. During these early years, attention was primarily directed toward the study of bile pigments in the duodenal contents and in the blood in various hemolytic anemias. From such a start, studies were further carried out on specimens of duodenal contents obtained from patients with various types of disease, particularly diseases of the biliary tract, such as cholelithiasis, cirrhosis, and conditions involving the pancreas. Until the advent of oral cholecystography, the use of duodenal intubation, with a careful examination of the sediment of duodenal contents for crystalline and cellular elements, helped appreciably in the diagnosis of gallstones and in evaluating the various phases of what is now called infectious hepatitis. During these early years, investigations were also made of the activity of various pancreatic enzymes in an effort to provide information concerning existing pancreatic disease — pancreatitis or carcinoma. With the advent of the Graham-Cole method of cholecystography in 1928, the need for study of the duodenal contents in the diagnosis of gallstones diminished rapidly and since that time has been used only in a selected group of patients. Such work, however, is still being carried out in this laboratory, in which duodenal contents are studied for evidence of calculus formation, based on the finding of abnormal quantities of bilirubin or cholesterol crystals, in patients with recurrent biliary colic following cholecystectomy. A recent review of this method of study by Mrs. Gladys Drummey in my laboratory and Dr. Marshall K. Bartlett indicates that analysis of the duodenal contents can provide very valuable diagnostic help in ruling in or out the presence of gallstones in a very high percentage of cases. Inasmuch as radiological methods of study in this group are relatively unsatisfactory, this method still constitutes an important diagnostic procedure.

Following the departure of Dr. Minot to the Huntington Memorial Hospital, the laboratory in its various phases has been under my supervision until the present time. In the early 1920's, still using gastro-intestinal intubation as a method, a very detailed and careful study was made of the phenomenon of referred pain, with particular reference to the entire alimentary tract. Tubes with inflatable balloons were introduced into the esophagus and followed throughout the entire length of the gastro-intestinal tract under fluoroscopic control. By balloon inflation, pain was produced at will and recorded, both as to the nature and quantity of the pain and its more or less precise location. The various usual and rather bizarre types of referred pain were satisfactorily mapped out from observations at different levels in the tract, and these studies have proved of real clinical use in localizing or helping to localize various types of digestive tract disease. In addition, the significance of the symptom "heartburn" was fully studied, and it was found that substernal or high epigastric distress characterized by a distinct burning quality was more frequently due to smooth muscle tension in the lower end of the esophagus than to the degree of acidity that had previously been supposed to be the sole cause of the symptom. These particular studies on pain were carried out with the help of Dr. Wyman Richardson.

During this same period of time, initial studies were made upon the response of gastric acid secretion in ulcer patients and in patients with achlorhydria and achylia. One important point that was recognized was that the secretion of sodium was an important fact in gastric secretion. At the same time, working with Dr. Monroe A. McIver, it was possible to show that losses of large amounts of gastric juice or duodenal juice, which included bile and pancreatic secretions, involved important losses of base as well as acid elements.

During the 1920's the laboratory was located in the basement of the Bulfinch Building. Subsequently, in about 1930, the investigative work was done in a larger laboratory on the first floor of the Bulfinch Building, which was shared with Dr. Walter Bauer. At this time two types of studies were initiated: one directly connected with postoperative nutritional edema, which was frequently encountered in this Hospital and elsewhere; and the second on the behavior of plasma fatty acids after epinephrine injection in patients with liver disease. Postoperative nutritional edema entirely analogous to that noted in the Hospital wards was produced in animals by various measures, which resulted in a lowering of serum albumin and was precipitated or accentuated by the concurrent administration of generous amounts of saline solution. These findings clearly demonstrated the necessity of limiting the amount of sodium chloride and water in postoperatively depleted individuals and in patients with chronic suppurative processes with resulting albumin deficits. The significance of sodium as such was not recognized at this time. This work was carried out with the help of Mrs. Frances B. Eaton and the surgical assistance of Dr. James C. White.

Work on plasma fatty acids, done with the help of Mrs. J. W. Fish, using a method devised by Dr. James L. Stoddard, revealed the fact that normal rises in plasma fatty acids after epinephrine injection did not occur in serious liver disease, and that this finding alone might be of some prognostic significance in patients with hepatic disorders. The method was time-consuming and very difficult, but at the time the work threw some further light on one of the many little-understood liver functions.

A very important series of observations was made by Dr. Benjamin V. White in the later 1930's, studying particularly the effect of irritants and drugs affecting the autonomic nervous system upon the mucosa of the rectum and rectosigmoid. These observations provided very important information as to functional changes occurring in the bowel secondary to disturbances of the autonomic nervous system, and were referable not only to the production of symptoms in "mucous colitis" but to a clarification of many of the factors that are operative in the presence of organic disease of the digestive tract. They were entirely comparable to observations on the stomach originally made by Beaumont and recently by Drs. Harold G. Wolff and Stuart Wolf.

Further collaboration with surgical colleagues continued in the later 1930's, and from 1939 to 1942 work was being done with Dr. Marshall K. Bartlett, with the technical assistance of Miss Anne Ryan, on experimental wound healing, both in animals and in human beings, as it related to vitamin C content. This confirmed the work of Lanman and Ingalls published in 1937, and we were able to demonstrate that in human beings tensile strength in operative wounds was distinctly less in the presence of a serious deficiency of vitamin C. This was particularly true in the presence of local wound sepsis, but was also true in clean wounds. It was shown that the sulfonamides did not affect the tensile strength of such scar tissue.

In 1940 the laboratory unit was moved to the fourth floor of the Bulfinch Building, in the Allen Street wing of the medical section. At this time many of the routine tests of liver function were being worked out to determine their clinical usefulness.

At the end of the war and for several years thereafter, Dr. Wade Volwiler worked in the laboratory. His studies were directed primarily toward diseases of the liver. One of the most important aspects of his work was the establishment of needle biopsy as a proper diagnostic procedure in establishing the identity of various types of liver disease. Still more important was the demonstration by him that "fatty liver" or fatty changes in so-called alcoholic cirrhosis could be reversed by adequate dietary therapy. He demonstrated clearly that these reparative changes could occur simply by the use of a diet containing sufficient calories and sufficient protein, without the addition of supplements of vitamins or lipotropes.

Following the war, work was carried out by Mrs. Drummey, Miss Ryan, and me on the nutritional disturbances subsequent to subtotal gastrectomy. These disturbances in certain patients were of sufficient importance from the point of view of loss of weight and strength to initiate detailed observations on food absorption, to determine, if possible, why the maintenance of weight was a continuing problem for such patients. It was found that many of these patients had very striking steatorrhea, with losses of large amounts of split fat in the stools. Dr. Perry J. Culver helped to carry on this work, and by means of careful balance studies demonstrated that this loss of fat without concomitant loss of protein and carbohydrate explained in part the nutritional problem. The underlying mechanism which prevents normal fat absorption still awaits clarification. These investigators also demonstrated clearly that fat absorption in the digestive tract in various conditions, such as sprue, pancreatic insufficiency, and the post-subtotal gastrectomy syndrome, could be helped by the use of an emulsifying agent.

Dr. Culver also carried out a long series of studies on the existence of specific vitamin deficiencies in hospital patients. From his studies it became evident that real vitamin deficiencies were of much less importance than was currently believed and that prolonged intensive vitamin therapy was totally unnecessary in most instances.

As a result of the studies on faulty fat absorption, work has been continued in subsequent years and is being carried on very actively at the present time in relation to the entire subject of intestinal absorption. The sprue syndrome has been investigated very carefully by means of balance studies by a group of research fellows and others working in the laboratory, particularly Dr. Warren Point, Dr. Culver, Dr. John A. Benson, Jr., Dr. Geoffrey N. Chandler (Leeds, England), and Dr. Stuart Ragland, Jr. These studies have concerned themselves with absorption defects in sprue patients, in Whipple's disease, in pancreatic disease, and in malnutrition states after anastomotic surgery. The striking effect of corticosteroids in improving intestinal absorption in patients with sprue and with Whipple's disease was clearly demonstrated by the group, with valuable clinical assistance from Dr. Daniel S. Ellis. Dr. Ragland, with help from Dr. Fritz Lipmann and Dr. Morris Soodak, has done important work on intracellular enzyme activity, based on material obtained from the mucous membranes in human beings and in animals. His studies are directly related to the work on intestinal absorption. Dr. Chandler and Dr. Benson, using a method previously modified by Dr. Point, made a careful investigation of the site of optimal absorption of olive oil from the small intestine of rats. They clearly demonstrated that the site of maximum absorption was at or near the jejunoileal junction. In the latter part of the work they were helped by Dr. Jacques Gagnon (Montreal), who also collaborated with the Department of Radiology in the introduction of the new method of intravenous cholangiography, using Biligrafin as a radio-opaque dye.

During 1953 and 1954, another field was entered with the work of Dr. Howard M. Spiro. This work concerned the study of gastric pepsin secretion as reflected in the secretions of the stomach and the blood pepsin levels observed under varying conditions. Dr. Spiro was able to confirm the fact that high blood pepsin levels were associated with the majority of patients with duodenal ulcer. He also studied, with Miss Anne Ryan, the behavior of blood pepsin after total gastrectomy and in patients with true achylia gastrica, as well as the effects of subtotal gastrectomy and parathyroidectomy in patients with hyperparathyroidism. Similar studies were carried out in patients with benign stricture of the esophagus, indicating two possible groups of patients, one with and one without a so-called "ulcer diathesis".

Beginning in 1948, in conjunction with the Department of Anesthesia and the Department of Surgery, a series of studies was undertaken by Chester W. Fairlie, Jr., Dr. Arthur French, and Dr. W. Carl Ebeling. These studies related primarily to the effect on hepatic function of anesthesia and operative procedures. They showed clearly that any operative procedure temporarily interfered with a variety of liver functions in normal individuals as well as in patients with hepatic disease. The differences in degree of hepatic disturbance did not bear any demonstrable and proved relation to the type of anesthesia, whether it involved the use of ether, cyclopropane, or, apparently, prolonged spinal anesthesia. The summation of medication, anesthesia, and operation, however, was clearly shown to have immediate postoperative effects on hepatic function, and this was particularly true in the group of patients undergoing shunt surgery for portal hypertension. With the very close cooperation of Dr. Robert R. Linton, patients were carefully studied before and after surgical intervention, and by such measures a great deal of valuable information was obtained, not only as regards variation in hepatic function, but also in relation to the choosing of proper operative risks among patients falling into this particular group. The clinical evaluation of the results of shunt surgery in Dr. Linton's patients has been followed in great detail by Dr. Daniel Ellis.

At the present time, with the rebuilding and re-equipment of the laboratory, which has been brought about by the generosity of the Trustees and by some individual gifts, work on intestinal absorption is continuing, and studies are currently under way by Dr. Lawrence Warbasse on the effect of motility on intestinal absorption. Dr. Munir Shamma'a (Beirut, Lebanon) is studying the behavior of magnesium, with particular reference to hepatic disorders. Balance studies are being carried on in many of the phases of absorption on patients in the Mallinckrodt Ward, and newer techniques are being developed for a continuation of the investigation of various facets of the entire problem of small bowel physiology.

During the past fifteen years, Dr. William P. Chapman has been working more or less with my group, with particular reference to pain thresholds and variations in gastric motility in relation to newer antispasmodic drugs, morphine derivatives, and so forth. He has been assisted in this work by Dr. Eirwyn N. Rowlands (London, England) and by others among the research fellows who have been with the group since the war.

During the thirty or more years during which this laboratory and the gastro-intestinal group have been active at the Hospital, special mention should be made of the fact that the closest collaboration has been present at all times between various members of the Surgical Service and our own group. Many studies have been carried on in direct collaboration with the surgeons, as noted above, and invaluable advice and help have been obtained from and freely given by various individuals throughout the Hospital. Over the last twenty years, approximately, a great deal of the success of the laboratory work has been due to the constant and devoted effort of Mrs. Gladys Drummey and Miss Anne Ryan, who are active members of the group. At the present time the immediate direction of the laboratory is in the hands of Dr. Perry J. Culver and Dr. John A. Benson, Jr.

Chester M. Jones, M.D.,
Visiting Consultant in Medicine

* * *

Dr. Joseph S. Barr, Chief of our Orthopedic Service, has been elected Honorary Fellow of the British Orthopaedic Association.

* * *

The Los Angeles Southeast Kiwanis Club received the top 1954 award of Kiwanis International for community service, for sponsoring the Southeast Los Angeles Crippled Children's Clinic. This Clinic is under the direction of Dr. Harvey E. Billig, Jr. (*Or.* 1935).

Mr. Elliot L. Richardson, a Boston attorney, has been appointed Secretary of the Corporation of the Massachusetts General Hospital, thus becoming the thirteenth Secretary of the Corporation since the founding of the Hospital in 1811. He succeeds Mr. Reginald Gray, who has served the Hospital in this capacity since 1930.

Mr. Richardson is a graduate of Harvard, where he received his A.B. and LL.B. degrees. He served in the Medical Department of the Army in World War II, and was awarded the Bronze Star and Purple Heart. He was President of the Harvard Law Review in 1947, and was Law Clerk to Judge Learned Hand from 1947 to 1948 and Law Clerk to Justice Felix Frankfurter from 1948 to 1949. He was formerly Assistant to Senator Leverett Saltonstall. He is associated with the law firm of Ropes, Gray, Best, Coolidge, and Rugg. He is a resident of Brookline, where he is a member of the Board of Library Trustees and was formerly a Town Meeting member.

Mr. Richardson's appointment brings into close association with the Massachusetts General another member of a family long connected with the Hospital. He is the son of the late Dr. Edward P. Richardson (who began his affiliation with the Massachusetts General as an Intern in 1906 and subsequently advanced as a member of the Staff until he finally became Chief of the West Surgical Service); and the grandson of Dr. Maurice H. Richardson and Dr. Frederick C. Shattuck (both long associated with the Hospital—the former reaching the rank of Surgeon-in-Chief, and the latter that of Senior Physician). A brother, Dr. Edward P. Richardson, Jr. is Assistant Neurologist and Neuropathologist at the Massachusetts General; and another brother, Dr. George S. Richardson, is Assistant in Surgery at the Hospital.

The Board of Trustees, at their meetings on October 28 and November 25, voted:

To accept the resignation of Dr. Mary S. Coley as Assistant Resident on the Children's Medical Service, as of July 1.

To appoint:

Dr. Anthony C. Allison as Assistant Physician and Assistant Pathologist;

Dr. Sylvia A. Davies as Assistant Resident on the Children's Medical Service, beginning July 1;

Dr. Albert C. England, Jr. as Assistant in Neurology, beginning October 1, 1955;

Dr. Robert S. Harper as Third Assistant Resident in Pathology, beginning July 1;

Dr. Philip H. Leiderman as Resident in Psychiatry, beginning July 1;

Dr. Robert C. Lincoln as Assistant Dental Surgeon;

Dr. Jan-Henrik Probst as Assistant Resident on the Children's Medical Service, beginning July 1;

Dr. Judson G. Randolph as Second Assistant Resident in Surgery, beginning March 1;

Dr. Paul S. Russell, Jr. as First Assistant Resident in Surgery, beginning November 1, 1955, and as Resident in Surgery, beginning January 1, 1956;

Dr. Theodore van Ravenswaay as Second Assistant Resident in Pathology for one year, beginning July 1.

At their meetings during November, the General Executive Committee voted:

To promote:

Dr. Norman W. Andrew to the position of Resident in Anesthesia, effective November 1, 1955;

Dr. Wayne M. Hebertson from the position of Assistant Resident to that of Resident in Neurology for one year, beginning July 1.

To reappoint:

Robert Crokaert, D.Sc. as Research Fellow in Biochemistry, through April 30;

Dr. John Denovian as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning December 1, 1955;

Dr. Nicholas J. Fiumara as Graduate Student Assistant and Clinical Fellow in Dermatology for one year, beginning October 1, 1955;

Theodore O. Macklin, A.B. as Research Fellow in Psychology for one year, beginning July 1, 1955;

Dr. Raymond D. Manchester as Clinical and Research Fellow in Dermatology for one year, beginning October 1, 1955.

To appoint:

Mary D. Albert, Ph.D. as Research Fellow in Medicine, effective as of November 1, 1955;

Dr. Philip W. Baker as Graduate Student Assistant and Clinical Fellow in Dermatology, as of September 1, 1955;

Dr. Immanuel Bitsch-Larsen as Graduate Student Assistant in Surgery, for the period November 8, 1955 through January 8, 1956;

Dr. Gerald E. Davidson as Clinical and Research Fellow in Psychiatry for one year, beginning January 1;

V. V. Koningsberger, Ph.D. as Research Fellow in Biochemistry, beginning December 1, 1955;

Audrey S. Mishler, B.S. as Fellow in Clinical Psychology, beginning September 1, 1955;

Dr. Lakshana Punyasiri as Graduate Student Assistant in Surgery, for the period November 1, 1955 through April 30, 1956;

Dr. Hsien Rin as Clinical and Research Fellow in Psychiatry, beginning on or about December 1, 1955;

Dr. Milton B. Smith as Graduate Student Assistant in Surgery, effective as of November 22, 1955;

Dr. John D. States as Clinical Fellow in Orthopedic Surgery (Poliomyelitis), for the period January 1 through June 30.

Mr. John H. Dobbins has been appointed Assistant Purchasing Agent. He started his duties last October 10.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

DESPITE OUR CONTINUOUS APPEALS FOR CLASSIFICATION OF MATERIAL, THIS MONTH RANKS AS THE LOWEST IN THAT RESPECT SINCE WE STARTED THIS COLUMN. ONLY 4 OF THE TITLES SUBMITTED INCLUDED THAT INFORMATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Dermatology

Randall, W. C., and Kimura, K. K.
The pharmacology of sweating.
Pharmacol. Rev. 7:365-397.

General Medicine

Burrage, W. S., Ritchie, A. C., Mansmann, H. C., Jr., Irwin, J. W., and Russfield, A. B.
The use of cortisone and hydrocortisone in allergy.
Ann. Int. Med. 43:1001-1018.

Harwood, R.
Diabetic acidosis: Prevention and treatment.
Diabetes 4:398-401.

Gynecology and Obstetrics

Fennell, R. H., Jr., and Graham, R. M.
A serial-section study of the cervix in cases with positive vaginal smears and negative biopsies: A report of ten cases.
Cancer 8:310-314.

Graham, J. B., and Graham, R. M.
Antibodies elicited by cancer in patients.
Cancer 8:409-416.

Graham, J. B., and Wolfson, E. P.
The follow-up of cancer patients.
Cancer 8:872-874.

Liu, W.
Vaginal cornification in women with uterine cancer.
Cancer 8:779-784.

Meigs, J. V., and Liu, W.
Surgical and pathologic classification for cancer of the cervix: An evaluation of 250 cases.
Surg., Gynec. & Obst. 100:555-558.

Laboratory Science

Lever, W. F., and Waddell, W. R.
Idiopathic hyperlipemia and primary hypercholesteremic xanthomatosis. VII. Effects of intravenously administered fat on the serum lipids.
J. Invest. Dermat. 25:233-248.

Matoltsy, A. G.
In vitro wound repair of adult human skin.
Anat. Rec. 122:581-587.

Neurology, Neurosurgery, and Psychiatry

Farnsworth, D. L.
Emotions and learning.
Harvard Ed. Rev. 25:95-104.

Farnsworth, D. L.
Emotions & the curriculum.
Harvard Alum. Bull. Oct. 22:119, 122-125.

Lougheed, W. M., Sweet, W. H., White, J. C., and Brewster, W. R.
The use of hypothermia in surgical treatment of cerebral vascular lesions: A preliminary report.
J. Neurosurg. 12:240-255.

Orthopedic Surgery

Barr, J. S.
Spondylolisthesis.
J. Bone & Joint Surg. 37-A, no. 4:878-880.

Miscellaneous

Butler, A. M.
Presentation of the John Howland Medal and Award of the American Pediatric Society to Dr. James L. Gamble.
A.M.A. Am. J. Dis. Child. 90:483-486; acceptance by Dr. Gamble: 486-490.

A member of our Board of Consultation asked us the other day if titles of articles or books written by members of that Board are eligible to appear in this column. Our reply was an enthusiastic YES.

BIOGLETS

Dr. Stephen E. Hedberg, Intern in Surgery — born in Boston, Massachusetts, November 17, 1929; attended Phillips Exeter Academy, 1944-48; Harvard College, Class of 1952; M.D., Harvard Medical School, 1955; married; two sons; home: 16 Barbara Road, West Newton, Massachusetts.

Dr. Geraldine M. Peiffer, Assistant Resident in Anesthesia — born in Hammond, Indiana, November 18, 1923; B.S., St. Francis College, Fort Wayne, Indiana, and Indiana University, 1945; M.D., Loyola Medical School, Chicago, Illinois, 1949; Intern, Little Company of Mary Hospital, Chicago, Illinois; private general practice for 5 years; home: Hammond, Indiana.

Dr. Albert L. Rosenthal, Assistant Resident in Dermatology — born in New Bedford, Massachusetts, July 25, 1926; B.S., Tufts College, 1946; mathematics teacher, High School, Fairhaven, Massachusetts, 1946-47; M.D., Tufts Medical School, 1951; Intern, Rhode Island Hospital, Providence, Rhode Island, 1951-52; Assistant Resident in Surgery, Rhode Island Hospital, 1952-53; military service: Captain, USAF, stationed in New Jersey, Alabama (School of Aviation Medicine), and Dallas, Texas, 1953-55; married; one son; present address: 1408 Commonwealth Avenue, Brighton, Massachusetts.

Dr. Charles P. Summerall, III, Intern in Medicine — born in Washington, D.C., September 9, 1929; A.B., Harvard College, 1951; M.D., Harvard Medical School, 1955; home: Belmont, Massachusetts.

Dr. Paul M. Veazey, Intern in Children's Medicine — born in Kendallville, Indiana, June 8, 1929; A.B., Oberlin College, 1951; M.D., Western Reserve University, Cleveland, Ohio, 1955; married; one son.

Dr. James T. Wheeler, Intern in Medicine —born in Abilene, Texas, February 28, 1931; B.S., Baylor University, Waco, Texas, 1951; M.D., Johns Hopkins Medical School, 1955; Pediatric Clerkship, Guy's Hospital, London, England, 1955; home: Abilene, Texas.

MASSACHUSETTS EYE & EAR INFIRMARY

The fall meetings of the New England Oto-Laryngological Society and the New England Ophthalmological Society took place at the Infirmary on November 16. Both societies held clinical sessions in the morning, and the afternoon was devoted to the presentation of papers.

Dr. Frederick T. Hill of Waterville, Maine, Dr. John S. Lewis of New York City, Dr. Anderson C. Hilding of the University of Minnesota, and Dr. Moses H. Lurie, Dr. George F. Reed, and Mr. David B. McClosky of the Infirmary staff participated in the afternoon session of the Oto-Laryngological Society.

Speakers at the Ophthalmological Society meeting included Dr. Taylor R. Smith (Associate Pathologist at the Infirmary), Dr. George B. Corcoran, Dr. Alston Callahan, Dr. Hugh C. Donahue (Associate Surgeon in Ophthalmology at the Infirmary), and Dr. Hugh L. Ormsby.

Dr. William W. Montgomery was appointed Assistant in Otolaryngology by the Executive Committee on September 12. Dr. Montgomery has also been recently named to the staff of the Harvard Medical School as an Assistant in Otology.

Dr. William P. Beetham participated in the Sixth Postgraduate Course, November 10 and 11, at the State University Medical Center, Syracuse, N. Y. He gave three lectures, whose subjects were: "Keratopathies associated with lacrimal secretion", "Ocular changes in endocrine diseases", and "Diabetic proliferating retinopathy".

Dr. Richard B. Chapman addressed the monthly meeting of the Parents of Blind Children at the Perkins School for the Blind in Watertown, on November 17. Dr. Chapman, one of the founders of this group, spoke on the use of oxygen for newborn babies and the strides made in the prevention of blinding eye diseases in this group of children.

No. 56 in a series of Staff photographs
Dr. Fuller Albright—Physician

No. 57 in a series of Staff photographs
Dr. Chester M. Jones—Consulting Visiting Physician

Dr. Robert K. Abraham, from the Institute of Ophthalmology, London, England, will be working in Dr. W. Morton Grant's office until June. Prior to his work in London, Dr. Abraham studied at the Kresge Eye Institute in Detroit, Michigan.

Dr. Charles J. Rife was attached to the Howe Laboratory before he started his residency this month.

Dr. David G. Cogan and Dr. Toichiro Kuwabara spoke on "Aberrant lipogenesis in the corneal explant" at the Harvard Medical Society symposium on lipoproteins and atherosclerosis, on December 13.

The following votes were passed at a meeting of the Executive Committee of the Infirmary, held on October 17:

To grant Dr. Knud K. Dreisler leave of absence for one year, effective September 1, 1955, for special study in Europe.

To appoint:

Dr. Adolfo Correia Branco as Resident in Otolaryngology, as of October 1, to replace Dr. Achira Sakudo;

Dr. Alfred W. Scott as Assistant in Ophthalmology, on completion of his residency, November 1;

Mr. Charles T. Wood to the position of Assistant Director, to replace Mrs. Wayland.

At a meeting of the Executive Committee, held November 21, the following appointments were made:

Dr. Peter Beck — Assistant in Ophthalmology

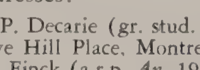
Dr. Alan S. Freemond — Fellow in Ophthalmology

Leave of absence was granted to:

Dr. Calvin M. Cerrato, Assistant Surgeon in Otolaryngology, for one year;

Dr. S. Forrest Martin, Assistant Surgeon in Ophthalmology, for three months, beginning November 1, 1955.

In a very roundabout way the editor of The News recently heard of an unusual and outstanding tribute that was paid to Miss Anita B. Mangiaracine at the Alumnae Day ceremonies held at Radcliffe College last June. For her notable work in the professional field since her graduation, an honorary Phi Beta Kappa award was conferred upon Miss Mangiaracine. The following citation accompanied the award: "Miss Anita B. Mangiaracine, as Bacteriologist at the Massachusetts Eye and Ear Infirmary, through industry and perseverance has developed bacteriological techniques indispensable to the practice of ophthalmology and otolaryngology."



New addresses:—

Dr. Leandre P. Decarie (gr. stud. a. *M.* 1955), 5383 Grove Hill Place, Montreal, Canada

Dr. Albert J. Finck (a.r.p. *An.* 1949), 39 Somerset Rd., Brookline 46, Mass.

Dr. Mark R. Knapp (a.r.p. *An.* 1955), 135 North Bluff, Wichita, Kan.

Dr. Lowell W. Lapham (res. fel. *N.P.* 1955), Institute of Pathology, 2085 Adelbert Rd., Cleveland 6, Ohio

Dr. Alberto Mazzoleni (gr. stud. a. *M.* 1955), Beth Israel Hospital, 330 Brookline Ave., Boston 15, Mass.

Dr. J. H. Thomas Rambo (*Otolar.* 1948), 535 Park Ave., New York 21, N. Y.

Dr. Marvin D. Siperstein (a.r.p. 1955), Department of Internal Medicine, University of Texas Medical School, Dallas, Tex.

Dr. Wilder Tileston (*E.M.* 1900), Box CC, Carmel Valley, Calif.

Brief bits:—

Dr. Benjamin Castleman conducted the Tenth Annual Tumor Day Slide Seminar at the Albert Einstein Medical Center in Philadelphia, on November 15.

On November 3, Dr. Robert R. Linton left by Pan American Airways to see a patient in Montevideo, Uruguay, at the request of the Uruguayan Embassy here in Boston and our State Department in Washington. After seeing the patient and advising treatment, Dr. Linton was back in Boston on November 7. Modern air travel has certainly shrunk our world!

At the New England Cardiovascular Society meeting on November 14, Dr. J. Gordon Scannell presented a paper written by Dr. Edward F. Bland, Dr. William R. Brewster, Jr., and Dr. Scannell. The subject of the paper was "Successful removal of a myxoma from the left atrium".

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

The next teas for our visitors from other lands will be held on January 26 and April 2. It is hoped that the Staff Wives and the visitors will make a note of the dates and attend these pleasant occasions.

Recorded music was played in the Chapel, Monday through Friday, for the two weeks before Christmas. Members of the Music Committee took turns attending to the placing of proper holiday music on the recording machine.

CHILDREN'S MEDICAL SERVICE

OUT-PATIENT CLINIC — A PROGRESS REPORT

This brief report on the doings of the Children's Medical Out-Patient Service concerns: first, things done during the past ten years that we believe are essential to improving the quality and efficiency of out-patient care and teaching; and second, things that haven't been done that need doing.

In 1945 a staff physician with part-time salary (provided by hook and crook) was appointed to direct the Out-Patient Clinic. The first appointee was Dr. Gertrud Reyersbach, who was succeeded by Dr. Frederic Blodgett. This staff physician, in daily attendance during clinic hours, makes sure that each "old" patient sees his own clinic doctor, assigns each new patient to a doctor, sees his own patients, acts as consultant to staff and students or aids in obtaining proper consultations, calls the staff's and students' attention to interesting patients, goes over records at end of clinic to see that they are complete and that information obtained and treatment given or recommended are promptly given to referring physicians by telephone or letter, consults with the nurse in charge and social workers about operation of the clinic, and directs the secretary and volunteer workers in performance of their functions.

In 1948 an Out-Patient Resident receiving salary and board was appointed. The clinical experience incident to the care of ambulatory patients effectively bridges the gap between in-patient residency training and pediatric practice. This year of residency has been approved for training by the American Board of Pediatrics. The opportunities and responsibilities include seeing his patients, assisting the staff physician in charge in performing the functions enumerated above, and in the afternoons attending either ward rounds, well baby clinic, rheumatic fever clinic or endocrine-metabolic clinic. In addition, he rotates with other Assistant Residents of the Children's Medical Service nights, holidays, and week ends. His presence daily in the clinic throughout the year has greatly increased the efficiency and continuity of the clinic's health and medical care.

Also in 1948 Out-Patient Service rounds from 12:00 - 1:00 each Wednesday were inaugurated. Here selected cases that cover diseases or problems not encountered with in-patients are presented to the full-time, out-patient and resident staffs, medical students, and social service and nursing staffs.

In 1950 a preview session to review the history and discuss current problems, needs, and therapy of the patients coming to the endocrine-metabolic clinic was inaugurated. This is held in the Children's Medical Service Conference Room on Fridays, 12:45 - 2:00 P.M., prior to seeing the patients in the Out-Patient Clinic at 2:00 P.M. The senior staff of the endocrine-metabolic unit, interested staff physicians, research fellows, house staff, and graduate and undergraduate students attend. Each week one of the research fellows of the unit, having assembled and abstracted records of patients to be seen, presents the history of each. Following discussion by the group of the problems, needs, and therapy, each patient is then designated to be seen in the clinic by his or a particular physician. This preview session provides an opportunity for excellent teaching, permits a single physician to promptly apply the knowledge of the group to the care of the patients, and to obtain further consultation at the clinic from any member of the group should the need arise. As in other clinics, findings and treatment are promptly reported to referring physicians, responsibility for future treatment by referring physician or clinic being determined according to the former's preference.

In 1952 a full-time salaried secretary was appointed who not only manages the distribution of the records of each clinic, but also checks them for completeness at the end of each clinic, writes letters dictated by the director of the clinic and the out-patient resident, and keeps track of the return and new appointments of patients.

In 1953 the appointment system that we had introduced several years before really became effective, covering 80% of out-patient visits of new and return patients.

In 1953 we also made a beginning in improving consultations by consultants in psychiatry and convulsive disorders coming to the Children's Out-Patient Clinic and there seeing the patients with the pediatrician and students, graduate or undergraduate.

In 1954 such consultants in the Children's Out-Patient Clinic became available daily for dermatology, Tuesdays and Fridays for allergy, Thursdays for hematology and by arrangement with Dr. William Quinby for surgery. And this year, consultations in neurology are available daily in the Children's Clinic.

Also in 1954 we again started, after several years' lapse, having fourth year students participate in out-patient care. We and, we think, they like it.

Perhaps mention should be made that there is now provision whereby patients whose incomes exceed out-patient eligibility may be seen by staff physicians in the offices available to the staff of the Children's Medical Service and Child Psychiatry Unit.

Finally, this past year after years of effort, appointments were and are made not only for a particular day but also for a specified hour and for a particular doctor.

And what is needed?

First, those things that require no construction:

The collaboration of all Services, this one included, in providing consultations where the patient and attending physician are. This will avoid shunting the patient to a consultant at another clinic, usually on another day, to be seen without benefit of the presence of the referring physician. In many instances a consultation at the Children's Clinic with the pediatrician will complete in one visit the medical care that all too often takes three visits under the shunting system. The on-the-spot consultation will also provide far more education for pediatrician, consultant, and graduate or undergraduate student. Though there are difficulties to be overcome, of which inertia and traditional conformity are not the least, the benefit to patient, pediatrician, and consultant may be such as to overcome them, if only the start is made. Staff, out-patient attendance, and interest could even boom.

The provision from the Department and/or Service budgets of an appropriate half-time salary for the physician in charge of the Out-Patient Service would seem essential for each of the 8 or 9 major divisions of Out-Patient Services, if the Hospital is to make a serious effort to improve its out-patient teaching and the efficiency and quality of its service to ambulatory patients. The approximate cost of $35,000 per year for such salaries would appear small in proportion to the benefits obtained, including an economy per medical service rendered. Under the present undirected shunt system the cost of service obtained here may exceed that incurred in obtaining care through the facilities of private practice.

Improvement in the manner in which out-patients pay for x-rays and laboratory tests.

Reappraisal of patient's ability to pay after the costs of his illness, particularly chronic illness, can be appraised. Not infrequently the patient's ability to meet the costs of medical care are determined at the first visit by an individual who does not have the information on which to base an estimate of ultimate costs, even if the admission complaint or referral note indicates the correct diagnosis.

Means by which patients coming to the M.G.H. for medical care, whose incomes disqualify them for "clinic" care, may obtain the benefit of M.G.H. medicine at the M.G.H., the fees for service to such patients accruing to the staff of the Services that provide the care.

And last but not least, the physical needs:

More waiting and playroom space.

A room for Out-Patient Rounds.

Better clinical laboratory facilities where doctors carry out procedures.

Better toilet facilities for collecting specimens and for ordinary use.

An Out-Patient X-ray Service that is geared to provide prompt examination of the ambulatory patient who should be in the Hospital for only a few hours and should not have to return another day for x-rays, with all the inconvenience, loss of patient and parent time, extra expense and delay in obtaining needed medical care.

Of course, when the Massachusetts General Staff Associates are established in the revamped jail (with its beautiful old cupola replaced, with colorful print curtains accentuating the lovely windows now masked by bars, and with the dignity and grace of its architecture a fitting symbol of the healing arts housed therein) and when a new building for ambulatory patients is functioning, all these things and more too will be accomplished. But let's hope that some of the things that need to be done will have been done before then; for the more we learn how best to function with the physical plant at hand, the better will we know what to do when we are blessed with the bounty that will make all our wishes for the better serving of our patients come true.

Allan M. Butler, M.D.,
Chief of Children's Medical Service

⁂

The 1956 *Modern Medicine* Award for Distinguished Achievement was presented to Dr. Stanley Cobb by the Board of Editors "in recognition of outstanding contributions to the progress of medicine as exemplified by a lifetime of leadership in neurology and psychiatry and his studies of the relation of neurophysiology to clinical disease".

Dr. John L. Wilson (*E.S.* 1940) was awarded the Order of the Cedars by the Lebanese Government, at the graduation exercises of the American University of Beirut last summer. It is a very rare honor for a non-Lebanese to receive this decoration. Dr. Wilson has been serving as Professor of Surgery in the American University of Beirut, and the award was primarily in recognition of his service to the fire victims last winter. We are grateful to Mrs. Claude E. Welch for this information.

Dr. Mary A. B. Brazier was elected a Fellow of the New York Academy of Sciences last December 1. The citation reads: "Election to Fellowship is a distinguished honor, conferred on a limited number of members, who, in the estimation of the Council, have done outstanding work toward the advancement of Science".

The Board of Trustees, at their meetings on December 23, 1955 and January 6, 1956, voted:

To grant Dr. Richard L. Rovit, First Assistant Resident in Neurosurgery, leave of absence for six months, beginning January 1.

To promote:

Dr. Dagoberto Sosa from Clinical Fellow to Second Assistant Resident in Neurosurgery, beginning January 1.

To appoint:

Dr. Adelbert Ames, III, as Research Associate in Neurosurgery, for the period September 1, 1955 through August 31, 1958;

Dr. Robert C. Coe as Assistant in Surgery, effective January 1;

John D. McLean, D.S.C. as Assistant Podiatrist on the Orthopedic Service, effective December 1, 1955;

Dr. Elliott L. Mancall as Assistant Resident in Pathology, assigned to Neuropathology, for one year, beginning July 1;

Dr. Otto Mollestad as Visiting Anesthetist pro tempore, for the two-month period beginning January 7;

Dr. Lloyd H. Smith, Jr. as Chief Resident in Medicine for one year, beginning January 1;

Dr. Madan M. Singh as Resident in Medicine, for a period of six months, beginning January 1.

At their meetings during December, the General Executive Committee voted:

To promote:

Dr. Roy J. Barry from Second Assistant Resident to First Assistant Resident in Radiology, beginning January 1;

Dr. Herbert B. Locksley to the position of Senior Resident on the Neurosurgical Service, as of January 1.

To extend the appointments of:

Dr. Richard A. Mayo as Assistant Resident in Orthopedic Surgery, for six months, beginning January 1;

Dr. Christopher H. Wood as Clinical Fellow in Medicine, from December 1, 1955 through February 29, 1956.

To reappoint:

Dr. Winnifred P. Chase as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. William B. Clapp as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. Albert I. C. DeFriez as Clinical Assistant in Medicine, effective as of December 15, 1955;

Dr. Theodor F. Hueter as Research Fellow in Physics, assigned to Neurosurgery, for one year, beginning January 1;

Dr. John W. Irwin as Clinical and Research Fellow in Medicine for one year, beginning January 1;

Dr. Irving H. Itkin as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. Louis Kunian as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. Donald P. Pederson as Assistant Resident in Anesthesia for one year, beginning April 1;

Dr. Raymond J. Savignac as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. John T. Sharp as Clinical and Research Fellow in Medicine for one year, beginning December 1, 1955;

Morris Soodak, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning January 1;

Dr. Gordon DuF. Winchell as Clinical Assistant in Medicine for one year, beginning January 1.

The General Executive Committee also voted:

That Dr. John F. Kelly be officially appointed as Podiatrist at the Hospital, under the Orthopedic Service;

That Dr. Alfred J. Luessenhop return to the Neurosurgical Service as First Assistant Resident, having completed his term of service in Neuropathology as of December 31, 1955.

⁂

ST. LUKE'S HOSPITAL — TOKYO

For many reasons St. Luke's Hospital, Tokyo, should be of interest to members of the MGH family, and the most compelling of these is that both institutions are dear to the heart of Henry Knox Sherrill. He it was who, together with Dr. Hirotoshi Hashimoto, the Director of St. Luke's, cooked up the plan of sending me to Tokyo to visit this famous hospital. Dr. Hashimoto visited Massachusetts General Hospital shortly after World War II—some of you may recall him—and Bishop Sherrill was in Tokyo the autumn of 1953. The project now to be described resulted from their meeting at that time and place.

As I understood it, what they wanted me to do was to pay a goodwill professional visit to St. Luke's, make friends with its staff, exchange ideas with them, observe the scope and character of their activities, and give thought to the possibilities of future development of the hospital. Accordingly, since I cannot refuse anything Henry Sherrill asks me to do, I took off for Tokyo on June 13, 1955—happily for me, accompanied by my wife and my 19-year-old stepdaughter, Beth Butler. We made the entire trip by air, out by Northwest Airlines, with stopover at Seattle and fuelling stops at Anchorage, Alaska, and Adak in the Aleutians, and back by Pan American, with four days at Honolulu *en route*. All this flying was very comfortable, without mishap, and we enjoyed it very much. The northern route is 1000 miles shorter, but the southern is far pleasanter.

Striking the Japanese coast at Sendai in late afternoon of June 16, we had good views of the plains and mountains of Japan and a brief glimpse of Mount Fuji, silhouetted against the setting sun. Arrived at Tokyo's fine new airport at Haneda, our first and unexpected greeting came over the loud-speaker as we were in customs, from Mr. M. Kametani, M.I.T. 1925, President of the MIT Club of Japan! He presently turned up in the flesh and invited me to the next dinner of the Club. In short order we were welcomed next by the St. Luke's people, Dr. Hashimoto and Messrs. Henry F. Budd and J. Earle Fowler. They were all most cordial and whisked us off to the fabulous Imperial Hotel, which was to be our home for the next two months. Without much delay we started a pattern for our activities, which carried through our entire stay. Briefly, it was for me to spend most of my time at St. Luke's, with side trips to various other hospitals, medical schools, and laboratories. Mrs. Means and Beth quickly made friends—both Japanese and American—and proceeded to get for themselves rich experience in delving into the culture—social, artistic, and educational—of Japan. On week ends we visited some of the great sights —Nikko, Kamakura, and Hakone, and made one tour of a week to Gifu, Toba, Nara, and Kyoto. We were greatly aided in our sight-seeing by advice from our friends, Mr. Kojiro Tomita of the Boston Museum of Fine Arts, and Mrs. Tomita, and also by that wonderful book, *The enduring art of Japan,* by the late Langdon Warner.

But for me the chief objective was St. Luke's. This hospital was founded in 1900 by a zealot, Rudolf Bolling Teusler, a graduate of the Medical College of Virginia, as a medical mission of the Episcopal Church in the United States. Starting literally from scratch, Dr. Teusler, by sheer devotion and indomitable persistence, carried this project through the first thirty-four years of its distinguished institutional career, and died in the present superb building, of coronary thrombosis, on August 10, 1934. His final concern for the hospital was expressed in the words, "Let the work go on." It has done so.

Today's edifice, as it now stands, a 300-bed modern hospital, was opened in 1933. It represents about two-thirds of the architect's original plan. One more wing remains for completion. Preceding the erection of this building, St. Luke's had sustained a series of disasters beginning with complete demolition in 1923 of the then hospital by the greatest earthquake Japan had had for years, and two years after that, the destruction by fire of a temporary wooden structure which had been built after the earthquake. These tragic setbacks did not daunt Dr. Teusler. They merely stimulated him to raise vast sums of money, and to broaden the scope of his operations. The concept of a great medical center was born, and St. Luke's was well on the road to becoming just that when another blow struck in 1941 in the shape of the Pacific War and the confiscation of the property by the Japanese government. St. Luke's, however, continued to function as a civilian hospital until the allied occupation began in September of 1945. Then it was commandeered by the U.S. Armed Forces and became Tokyo Army Hospital, which it still is today. In the meantime, however, the civilian hospital staff have carried on under the aegis of the National Episcopal Church of Japan—the Nippon Sei Ko Kwai—in a set of wooden one-story pavilions next door. It was to this institution, now known as St. Luke's International Hospital, that I paid my visit.

What I found in operation was a voluntary, non-profit, general hospital of about 150 beds, with a nearly full-time professional staff, a good training program for interns and residents, but without university or medical school affiliation. It was also operating a polyclinic type of O.P.D. which cared for 600 patients per morning, on an average, six days in the week. This total service is approximately half that which St. Luke's permanent facility was previously providing, but is a very creditable job under existing circumstances for all that.

A very charming and excellent physician, head of the medical service, Dr. Shigeaki Hinohara, was appointed by Dr. Hashimoto to be my immediate guide, counsellor, and friend, and he performed that duty with the utmost efficiency and kindliness throughout my stay. Each week he provided me with my program of activities at St. Luke's—ward rounds, inspection tours, conferences, and interviews with a variety of key people. Altogether, an excellent opportunity was afforded me to see the whole operation and evaluate its quality.

We had round table conferences on such topics as endocrinology and medical education, and we started a thyroid clinic patterned after that of the M.G.H. Within the month (November) I have heard from Dr. Hinohara that it is rolling well and will continue. The cross section of clinical material, both in the thyroid clinic and in the hospital as a whole, is remarkably similar to what we have in the United States. They have more tuberculosis than we, but they are treating it in very modern fashion, and the mortality from it has been greatly reduced. I did see one patient with a condition which I have not seen for many years at the M.G.H.—acute syphilitic meningitis—a classical picture of it. This patient had all the fixings—stiff neck and Kernig, high lymphocytic white count in the spinal fluid, etc. He entered practically in coma, but made a very rapid recovery under full doses of penicillin.

I met the whole St. Luke's family twice at garden parties in the hospital grounds. The first, on June 20, was in honor of Colonel Charles L. Kirkpatrick, M.D. (retiring C.O. of Tokyo Army Hospital), Mrs. Kirkpatrick, and the Meanses. The second, on July 28, was in honor of the Right Reverend H. W. B. Donegan, Episcopal Bishop of New York, who was making a professional tour of Japan. Both occasions were very delightful and gave an opportunity to make many acquaintances among the staff, trustees, advisory committee, and friends of the hospital. St. Luke's is now entirely Japanese-owned, with its board of trustees corresponding to our own, of which the presiding bishop of the Sei Ko Kwai, Bishop Hinsuke Yashiro, is the chairman. He is the Sherrill, both of St. Luke's and of Japan. On the advisory committee, which is largely a prestige-giving body, are many distinguished persons. Of this committee at the garden parties I met such people as Admiral Nomura, who was Japanese Ambassador in Washington at the time of Pearl Harbor; Mr. Mikimoto, grandson of the famous "Pearl King"; and H.I.H. Prince Takahito Mikasa.

At the first garden party it became apparent that Colonel Kirkpatrick had been a good friend of St. Luke's. He had made many friendly gestures to its staff and was greatly liked by them. He was eager for the Japanese staff to regain its own facility, and I am sure he did all he could to promote this good cause. He told me of his high regard for the professional work at St. Luke's, and it is interesting in this connection that he had a number of young Japanese civilian doctors on his own intern staff in the Army Hospital.

Perhaps the brightest jewel in St. Luke's crown is the College of Nursing. Dr. Teusler started this way back in 1902, and it has been the prototype for all western style nursing in Japan. At present it has the status under the Ministry of Education of an independent junior college. As Miss White, its principal, said to me, "It is a university school of nursing without any university attachment." In medical social service, St. Luke's also pioneered. It did not start a school, but did start a department, with American trained workers as early as 1929. In my further jaunts about Tokyo, arranged and conducted by Drs. Hashimoto and Hinohara, I visited such places as the Imperial University of Tokyo, its medical school, and its University Hospital. I gave a clinical lecture there to the third and fourth year students, complete with patient, interpreter, and so forth. All Japanese are now taught English in school, and I discovered that many of the students were understanding me, through the expedient of making a wisecrack now and then and observing the number who laughed. I also gave on another day, in the same place, a lecture on the thyroid to the Endocrinological Society of Japan and the faculty.

I visited other hospitals and medical schools. At the First National Hospital, Tokyo, I gave another thyroid lecture, and at the Second National I found a very impressive radioiodine program. At the Tokyo Red Cross Hospital we found a very fine College of Nursing, patterned after St. Luke's. Of the private universities, Keio seemed tops. It has a very ambitious building program which includes a fine modern teaching hospital, part of which is completed.

Other interesting medical and educational places visited in Tokyo included the Institute of Public Health, founded in 1938, largely with funds supplied by the Rockefeller Foundation. I had the opportunity to see this through the courtesy of Dr. Oliver R. McCoy, its Chief Consultant. This institute, I am sure, has been the most important center from which public health work has spread through the country. It is operated under the Ministry of Welfare of the Japanese Government.

Two other universities visited were Rikkyo, or St. Paul's, an episcopal church university, now Japanese-owned and under the Sei Ko Kwai, and Japan International Christian University. The latter is quite new, with ambitious dreams for the future which include a medical school. Dr. Hashimoto is a member of its University Council, and Dr. Hinohara is Professor of Hygiene and University Physician. In Boston we find Mr. Robert F. Bradford a member of I.C.U.'s supporting foundation in the United States.

In my further wanderings I lectured on the thyroid at the Prefectural University Medical School at Gifu. I visited the medical school and hospital of the University of Kyoto, where I saw the Asiatic practice of having the family abide in the hospital to care and cook for the patient!

Dr. S. Nishizaki, Director of St. Barnabas' Hospital, Osaka, was extraordinarily kind to us. He had studied gynaecology, obstetrics, and female urology in Boston shortly after World War I, and had abundant recollections of the Boston Lying-in Hospital, the Free Hospital for Women, and particularly of the late Dr. Granville Crabtree. His obstetric and gynaecology hospital, St. Barnabas', is a beehive of activity and is giving, as far as I could judge, very good and modern care. Not only did he personally conduct us through Nara, Kyoto, and Osaka, but he arranged for my benefit at Osaka a round table discussion on the use of radioisotopes in medicine, which was attended by about 30 doctors, some of medicine interested in isotope work, while others were physicists of one sort or another. There was no language barrier; most of them spoke English and, also, we had an excellent interpreter, thoroughly bilingual, Dr. Yasushi Nishiwaki, biophysicist of the Osaka City University. Dr. Nishiwaki is working on problems of the Bikini fall-out and of *No. 5 Fukuryu Maru.*

At the request of Dr. Shields Warren, I paid a short visit to Hiroshima to observe the work of the ABCC research unit there. Dr. Robert H. Holmes, the Director, was most cordial and showed me everything that is going on, chiefly a long-term study of 6000 persons exposed to radiation at the time of the bombing 10 years ago. At present I gather that the most definite findings are the cases of leukemia, and of cataracts, but Dr. Holmes is confident that in subsequent years evidence of effects on maturation and the rate and quality of the aging process will become apparent.

From the aeroplane on which I went to Hiroshima I got some glimpses of the beautiful Inland Sea of Japan, but Mrs. Means and Beth, who independently went to the extreme western end of it at Beppu and returned by ship to Kobe, really saw it in all of its full beauty. It awakened memories of cruising Penobscot Bay on the old steamboat *J. T. Morse.* One not infrequently finds views in Japan that remind one of the coast of Maine, but there are great differences also, particularly as far as scenery goes, in the far greater abruptness of the mountains of Japan.

But let us return to the future possibilities of St. Luke's. Before I left the United States, Mr. Francis B. Sayre, who had recently spent a year in Japan working for the Episcopal Church, said to me that he hoped St. Luke's would become the greatest medical center in far eastern Asia. I agreed that this is a noble objective, but pointed out to him that no hospital can attain to such stature without a university medical school attachment. St. Luke's is already doing a good job of graduate teaching with its intern and resident training program, but the presence of undergraduate medical students and teaching and research programs must be added if it is to reach the top echelon of medical centers. Dr. Hashimoto and the staff of St. Luke's understand this fully and greatly desire it, but how it is to be accomplished is the $64 question.

It should be pointed out that modern medicine in Japan has been primarily German in pattern—authoritarian and didactic—Geheimrat medicine, in fact. In none of the existing medical schools do students get to the bedsides of patients in a responsible role as they do with us. At St. Luke's, on the other hand, although the professional staff is entirely Japanese, the spirit of American medicine is all-pervasive. The soil is ready for the implantation of American style clinical teaching with the focus on the patient instead of exclusively on the disease. Because of these dissimilarities I think it very doubtful that a union of St. Luke's and any of the existing Japanese medical schools can be consummated. It is my belief that only through the establishment of a new medical school along American lines, for which St. Luke's would provide the clinical departments, can the dream of a truly great medical center be realized. Dr. Hashimoto has for some years visualized all this. It would be a happy thing if St. Paul's University and St. Luke's Hospital, both under the Sei Ko Kwai, could be united in such an undertaking. There are, however, very great obstacles, financial and other. International Christian University, also, if it succeeds in developing a good medical school, might look upon the teaching facilities of St. Luke's as a godsend.

There are those who look with dismay at the establishment of yet another medical school in Tokyo, there being already about a dozen, but the point is that the new school visualized in conjunction with St. Luke's could constitute a pilot demonstration of a newer type of medicine which might spread through the country from that focus, as has public health work already done from the Institute of Public Health. There are the considerations, also, that there is always room for something better, and that Tokyo is an enormous and rapidly growing city. In all probability it will before long be the largest in the world.

Finally, it should be remembered that the decision lies entirely with the Japanese—they own and control all the institutions involved. However, I am convinced that the will exists at St. Luke's to do something of the kind I have indicated; and if this is correct, all the moral, financial, and other help we can give them from the United States, the better. First, St. Luke's must get back its own building from our Army. That should be soon. Then there will be a long developmental period. During that time, one thing that a place like the M.G.H. can do is to send over visiting doctors, either for relatively short periods, as in my case, or perhaps younger men would go for a year or so. They would, I am sure, be welcome, and they would have a rewarding medical experience.

James Howard Means, M.D.,
Member of Board of Consultation

New addresses:—

Dr. Irving P. Ackerman (*M.* 1951), E & M Clinic, Out-Patient Bldg., University Hospital, Ann Arbor, Mich.

Dr. Leland C. Brannon (r.s. *N.S.* 1955), U.S. Naval Hospital, Philadelphia, Pa.

Dr. Robert L. Brent (*C.M.* 1955), Dept. of Biophysics, Graduate School of Walter Reed Hospital, Washington 12, D.C.

Mr. James U. Casby (res. fel. *An.* 1955), Eastern Pennsylvania Psychiatric Institute, Philadelphia, Pa.

Dr. Richard Chute (*E.S.* 1929), Veterans Administration Hospital, 150 S. Huntington Ave., Jamaica Plain, Mass.

Dr. Lincoln D. Clark (*M.* 1948), Veterans Administration Hospital, Fort Douglas Station, Salt Lake City, Utah

Dr. George H. A. Clowes, Jr. (a.r.s. 1948), Cleveland City Hospital, Cleveland, Ohio

Dr. George Eisenman (res. fel. *An.* 1955), Eastern Pennsylvania Psychiatric Institute, Philadelphia, Pa.

Dr. Richard H. Eppright (a.r.s. *Or.* 1955), 5426 Windswept Lane, Houston 19, Tex.

Dr. Richard A. Field (*M.* 1950), Washington University School of Medicine, St. Louis, Mo.

Dr. James A. Flagg (a.r.p. *An.* 1955), 16 White Plains Rd., Trumbull, Conn.

Dr. Boy Frame (*M.* 1949), Henry Ford Hospital, 2799 W. Grand Blvd., Detroit, Mich.

Dr. Thomas R. C. Fraser (res. fel. *M.* 1940), Postgraduate Medical School, Hammersmith Hospital, Du Cane Rd., London, Eng.

Dr. Willy Hijmans (clin. & res. fel. *M.* 1955), Dept. of Rheumatology, University Hospital, Leyden, The Netherlands

Dr. Francis M. Ingersoll (*W.S.* 1939), 226 Marlborough St., Boston, Mass.

Dr. Verner S. Johnson (sr. r.s. *Or.* 1955), 27 Elm St., Worcester, Mass.

Dr. Edward Karamanoukian (a.r.p. *D.* 1955), En face du Cine Dianna, Aleppo, Syria

Dr. Glenn A. Langer (*M.* 1955), 195 W. Central Ave., Pearl River, N.Y.

Dr. Zwi Laron (r.p. *C.M.* 1955), Children's Hospital, Philadelphia, Pa.

Dr. Joseph L. Lewis (*C.M.* 1936), 25 Grant St., Waltham 54, Mass.

Dr. Robert C. Lincoln (*Dn.* 1953), 160 Longwood Ave., Boston, Mass.

Dr. George D. Ludwig (a.r.s. 1950), Hospital of the University of Pennsylvania, 3400 Spruce St., Philadelphia 4, Pa.

Dr. Marc P. Moldawer (clin. & res. fel. *M.* 1955), c/o Dr. Young, Dept. of Biochemistry, Cambridge University, Cambridge, Eng.

Dr. Donald O. Rudin (res. fel. *An.* 1955), Eastern Pennsylvania Psychiatric Institute, Philadelphia, Pa.

Dr. Alfred W. Scott (a. *Oph.*), 5 Bay State Rd., Boston, Mass.

Dr. Kadhim H. Shubber (clin. fel. *Or.* 1956), Director of Orthopedic Dept., Royal Hospital, Baghdad, Iraq

Dr. Lamar Soutter (a.r.s. 1941), 80 E. Concord St., Boston, Mass.

Dr. Bernard B. Stone (r.s. *N.S.* 1955), 65 Elm St., Worcester, Mass.

Dr. Iwao Uyeda (*C.M.* 1950), 2425 Geary Blvd., San Francisco 15, Calif.

Dr. Albert Van Eerde (a.r.p. *An.* 1955), Paterson General Hospital, Paterson, N.J.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Contribucion de la anestesia al exito de la cirugia toracica.
Separata de Septimas Jornadas Argentinas de Cirugia Toracica, 1-35.

Beecher, H. K.
Hazards in the field of anesthesia.
Imprimerie Medicale et Scientifique (Soc. An.), 1-19.

Dermatology

Lever, W. F.
Hauterscheinungen bei lipoidosen.
Dermat. Wchnschr. 132:1086-1094.

General Medicine

Chapman, E. M., and Maloof, F.
The use of radioactive iodine in the diagnosis and treatment of hyperthyroidism: Ten years' experience.
Medicine 34:261-321.

General Surgery

Cope, O., Hopkirk, J. F., and Wight, A.
Metabolic derangements imperiling the perforated ulcer patient. I. The dehydration and fluid shifts.
A.M.A. Arch. Surg. 71:669-681.

McDermott, W. V., Jr., Wareham, J., and Riddell, A. G.
Treatment of "hepatic coma" with L-glutamic acid.
New England J. Med. 253:1093-1102.

Sewell, W. A., Koth, D. R., and Huggins, C. E.
Ventricular fibrillation in dogs after sudden return of flow to the coronary artery.
Surgery 38:1050-1053.

Wight, A., Hopkirk, J. F., DeMuylder, E., and Cope, O.
Metabolic derangements imperiling the perforated ulcer patient. II. Derangements and shifts of intracellular electrolytes: The need for potassium.
A.M.A. Arch. Surg. 71:839-852.

Otolaryngology

Kelemen, G.
Acute poliomyelitis of the mother, with aural lesions in the premature infant.
A.M.A. Arch. Otolaryng. 62:602-610.

Kelemen, G.
The pharyngeal orifice of the eustachian tube in the aged.
Eye, Ear, Nose & Throat Monthly 34:809-812.

Neurology, Neurosurgery, and Psychiatry

Matarazzo, J. D.
Comprehensive medicine: A new era in medical education.
Human Organization 14:4-9.

Matarazzo, J. D., Guze, S. B., and Matarazzo, R. G.
An approach to the validity of the Taylor Anxiety Scale: Scores of medical and psychiatric patients.
J. Abnorm. & Social Psychol. 51:276-280.

Matarazzo, J. D., Ulett, G. A., and Saslow, G.
Human maze performance as a function of increasing levels of anxiety.
J. Gen. Psychol. 53:79-95.

Books

Bakay, L.
The blood-brain barrier with special regard to the use of radioactive isotopes.
Springfield, Ill., Charles C. Thomas.

[This is the last issue of THE NEWS in which 1955 titles will appear.—*Editor*]

MASSACHUSETTS EYE & EAR INFIRMARY

Three doctors from the Infirmary will attend the Philadelphia Sectional Meeting of the American College of Surgeons on February 13-16. Dr. LeRoy A. Schall will speak on "The surgical management of malignancies of the paranasal sinuses". Representing the eye service will be Dr. Paul A. Chandler, who will speak on "Glaucoma surgery" as part of the Symposium on Recent Advances in Ophthalmological Surgery, and Dr. Charles L. Schepens, who will speak on "The present status of surgery of retinal detachment".

On January 1, Dr. Kevin Hill of Belgrade Lakes, Maine, began his research work in the Howe Laboratory. Dr. Hill, who will be here for one year, is the first recipient of the Eye Research Fellowship which was established by the Lions Club in honor of Dr. Edwin B. Dunphy, Chief of Ophthalmology at the Infirmary.

Among the eye specialists from the United States who attended the Fifth Pan-American Conference of Ophthalmology, held in Santiago, Chile, January 8-15, were Dr. William Stone, Jr. and Dr. Ichiro D. Okamura. Dr. Stone spoke on the implants used most commonly at the Massachusetts Eye and Ear Infirmary, and the surgical techniques used in secondary implants. Dr. Okamura presented a paper written by Dr. Charles L. Schepens on "The peripheral retina: Anatomy and clinical observations".

Mr. Alan Feldman of the Winthrop Foundation will be giving two courses at local colleges this month. He will teach "Diagnostic hearing testing" at Boston University, and "The nature, management, and special education of the exceptional child" at the Graduate School of Education of Northeastern University.

Mrs. Mary B. Doehler spoke on "Esophageal speech" at Emerson College in January. Mrs. Doehler conducts the Esophageal Voice classes for the laryngectomy patients at the Infirmary. She is also the secretary of the International Association of Laryngectomies.

Brief bits:—

Dr. Earle M. Chapman addressed the staff of the Beverly Hospital recently. His subject was "Recent advances in diseases of the thyroid".

Dr. Oliver Cope attended the Conference on Burns at Brooke Army Medical Center in San Antonio last November. On December 1, Dr. Cope delivered the AOA lecture at Baylor College of Medicine in Houston.

Dr. Richard H. Sweet and Dr. Grantley W. Taylor will participate in the Philadelphia Sectional Meeting of the American College of Surgeons, February 13-16. Dr. Sweet will speak on "Total gastrectomy, using the abdominothoracic approach", and in the Symposium on Lesions of the Esophagus he will talk on "Achalasia of the esophagus: Report based on 50 cases". In the Symposium on Surgery of the Neck, Dr. Taylor will lecture on "Radical neck dissection".

Dr. William A. Tisdale won honorable mention in the recent international photography contest for his colored picture of a mother and child in Korea. A black-and-white copy of his photograph appeared in the January 7 issue of *Saturday Review*. A copy of the picture is on the bulletin board near the foot of Treadwell stairs.

We were very glad to receive this interesting letter from Dr. Frederic W. Rhinelander (*E.S.* 1937 and *Or.* 1938), bringing us up to date on his activities and giving us a new address for him:

> I was in California for eleven years — three years in the Army, and eight years practising Orthopedics in San Francisco and San Rafael. That included teaching at the School of Medicine, University of California. While there are many MGH graduates in San Francisco, I was the only one in San Rafael, as you indicated in your letter. While I was in California, I believe I paid a visit to the M.G.H. at least once a year.
>
> Private practice in San Rafael became so hectic that my time for the University became regrettably curtailed. I did continue participation in the Orthopedic Resident Training Program, however.
>
> Last summer I moved to Cleveland, to become Chief of the Orthopedic Service at Cleveland City Hospital. This is a full-time job. I enjoy the type of work more than private practice. We are in the process of setting up an Orthopedic Resident Training Program. We

Dr. Edward D. Churchill and his Interns in Surgery

have a fine new research building, but are awaiting equipment.

My HMS classmate and MGH contemporary, Simeone, is, as you know, Director of Surgery at this Hospital, and was responsible for my leaving California. I may say that it was a very difficult decision to make. I hope that I may be able to return there again when I retire.

Dr. Oscar deF. Barretto (*An.* 1944), our "singleton" in São Paulo, Brasil, has sent us this interesting letter, together with his new address:

Your letter of July 20 arrived when I was on vacation in the north of the country. The one that you mention as having been sent to me some time ago didn't reach me.

Following are my activities since 1945. As soon as I arrived here I went to work in the Anesthesia Department of the Hospital Medical School (Hospital das Clinicas da Universidade de S. Paulo—1100 beds). Being a new hospital at that time, the knowledge and practice I acquired in the Massachusetts General Hospital greatly helped the Anesthesia Department which had just been born.

Under our influence, a Section of Anesthesiology had been created in the local Medical Association. I was the first secretary of the Association, and, last year, was the president of its Anesthesia Section.

In 1954 I was the treasurer of the 1st Brasilian and 2nd Latin-American Congress of Anesthesiology.

From February to August 1955 I was Medical Assistant to the General Director of the Hospital das Clinicas.

I have been elected assistant secretary of the Insurance Department of the Medical Association and of the Medical Syndicate for the period 1955-1956.

Besides all this, I have had my private clinic of anesthesia, oxygen therapy, and blood bank since 1945.

If you have the opportunity, please remember me to all my old MGH friends.

My new address is R. Armando Penteado 356 (Pacaembú), São Paulo, Brasil.

Dr. William N. Christenson (*M.* 1949) sends us this cordial letter from the Postgraduate Medical School, Du Cane Road, London W. 12, England:

The delay in my subscription to The News was occasioned by a pleasant period of travel this summer through Scandinavia and the Low Countries of northern Europe, prior to starting a year's fellowship in the Postgraduate Medical School. I am now working here in the laboratory, and am very happily settled in London, where so many MGH offspring have recently flourished.

I would like to pass on the information that any others from Massachusetts General who are presently on this trek will receive a warm welcome, either professionally in the Department of Haematology of the Postgraduate School, or socially at my home, or both.

From San Juan, Puerto Rico, has come this letter from Lt. Col. Frank L. Bauer, MC, USAR (*Path.* 1941):

Thank you for your 13 October letter inquiring about my address. I am located at Rodriguez Army Hospital, APO 851, c/o Postmaster, New York, N. Y. My assignment is Chief of the Medical Service.

Rodriguez Army Hospital is located in San Juan, Puerto Rico. It is roughly 600 beds in capacity and provides in- and out-patient service for Army, Navy, and certain categories of Air Force personnel located in the Caribbean area. The hospital itself occupies two buildings which were once part of the Spanish garrison. Part of these structures go back to the 1700's. They are built on a large quadrangle type of pattern and, depending upon one's viewpoint, are either "delightfully quaint" or "somewhat physically cumbersome and inefficient".

The island of Puerto Rico is being aggressively presented as a winter haven for North American tourists. Climatically it has everything that is to be desired. In addition, there are several ultra-modern hotels and associated swimming, boating, a professional baseball league, golf, etc. There is no horse racing, but legalized gambling of all types is offered. For anyone who wants all modern comforts elegantly served, this is the place. For the visitor seeking atmosphere and quietude, a less developed tropical isle would be in order.

* * *

On December 31, 1955, Mr. George E. Hamilton ended his services at M.G.H. For 23 years he had been a familiar figure at the Hospital as custodian of the doctors' parking lot. A coffee party, given in his honor in the Baker Lounge on January 3, was attended by scores of his friends, including members of the staff as well as non-professional personnel.

Before Mr. Hamilton left for a vacation in Florida he presented his last yearly award, for best parking during 1955, to Dr. Rita M. Kelley.

* * *

Of the grants totaling $500,000,000 made by the Ford Foundation on December 12 for privately supported institutions in the United States, $51,652,900 was designated for New England educational institutions and hospitals. Of this amount, Massachusetts General Hospital received $250,000—the largest single donation to the hospitals in Massachusetts.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 154 Boston, Mass. March 1956

BIOCHEMICAL RESEARCH LABORATORY

During the last few years* we have continued our efforts to enlarge on our early proposition that the energy of living organisms, although derived primarily from respiration, is used predominantly in the form of phosphate bond energy. It becomes now more and more apparent, indeed, that the energy-rich phosphate bonds of adenosine triphosphate (ATP) represent what we like to call the energy currency of the organism. Recently we concentrated (1) on the mechanisms by which the respiration process yields phosphate bond energy. And (2) we have followed various pathways by which phosphate bond energy is used for biosynthetic operations and, specifically, for urea synthesis.

The study of the mechanisms of respiratory energy transformations led us quite naturally to an interest in thyroxine, the hormone which regulates the animal's energy supply. Recent work in this laboratory by S. Harvey Mudd, Janey Harting Park, and Fred Hoch on the effects of thyroxine on cell-free preparations of liver (mitochondria suspensions) shows it to interfere with the transformation of respiratory into phosphate bond energy. Thyroxine, in higher concentrations, disrupts the linking between respiration and ATP formation. This uncoupling of respiration from the production of utilizable energy can explain the wasting of energy in the Basedow patient. Although many aspects of thyroxine action will still require considerable refinement, the action of the thyroid hormone, or rather, of the family of thyroid hormones, appears to channel through a regulation of the outflow of the utilizable energy from the primary process of respiration.

Turning now to utilization of phosphate bond energy, we concentrated on the study of the mechanism of urea synthesis. Urea, of course, is formed in the liver from ammonia and carbonic acid, ammonia being produced by respiration of amino acids. Ammonia is very toxic, as Dr. McDermott's recent studies in this hospital have beautifully amplified. It is detoxified to urea by combining two parts of ammonia and one of carbonic acid. This, however, requires energy and it had already been found by others that the energy used here by the liver again is phosphate bond energy. However, what was not known until recently was the form in which phosphate bond energy was chemically integrated into the process of urea synthesis. From studies in cell-free systems, carrying on the overall urea synthesis by using ATP as source of energy, we eventually arrived at the conclusion that a very unusual phosphorylated intermediary should be formed, a compound which we call carbamyl phosphate. The existence of carbamyl phosphate seemed to many organic chemists rather doubtful because it was thought to be too unstable to exist, unjustly as we know now. Through expert work by Dr. Mary Ellen Jones and the fine chemistry contributed by Dr. Leonard Spector, loaned to us by the Huntington group, we were able to verify our suspicions that carbamyl phosphate was indeed an intermediary in urea synthesis after it was found that carbamyl phosphate could easily be obtained by chemical synthesis.

The total process of urea formation is rather complex. We need not, however, presently go into the minute details of what is known as the "urea cycle" except that we want to point this out as a relatively simple example of how phosphate bond energy is used in biosynthesis: respiratory energy converts to ATP and ATP reacts with ammonia and CO_2 to form carbamyl$\sim$phosphate. This leads to further condensations, eventually yielding urea.

This may serve as an example that the early contention that phosphate bond energy is the general energy carrier in cellular reactions had been generally fruitful. It has permitted us, as well as a large number of other laboratories, to approach the energy problem much more rationally. The complex and intricate process of respiration, mostly the ultimate source of energy, can now very often be replaced by simply putting into our biosynthesis an energy-rich phosphate source, most often ATP. We are able in this manner to study the crucial phases of the biosynthetic process much more reasonably in a greatly simplified system.

This outline may serve as a general survey of what we are doing. The actual scope of our activities goes further and at the present includes such reactions as the activation of sulfate for formation of, e.g., phenol sulfate, steroid sulfate, or chondroitin sulfuric acid. This study is now beginning to give us the clue to a very curious and unusual process of activation of an inorganic compound, sulfate, by our phosphate bond carrier, ATP. This process, although of considerable biochemical and, I dare say, medical importance, I would prefer not to discuss in detail in order not to lead on too far into the maze of chemistry.

Fritz Lipmann, M.D.,
Biochemist

The Board of Trustees, at their meetings on December 9 and January 27, voted:

To accept with regret the resignation of Dr. Alfred L. Duncombe from the position of Clinical Associate in Medicine.

To appoint:

Dr. Richard M. Barry as Assistant Resident in Medicine for one year, beginning July 1;
Dr. Daniel K. Bloomfield as Resident in Medicine, beginning October 1;
Dr. Carl N. Brownsberger as Assistant Resident in Medicine for one year, beginning July 1;
Dr. John F. Burke as First Assistant Resident in Surgery, beginning January 1;
Dr. Chung H. Cho as Assistant Resident in Anesthesia for one year, beginning July 1;
Dr. Mandel E. Cohen as Assistant Neurologist;
Dr. Leslie J. DeGroot as Resident in Medicine, beginning January 1, 1957;
Dr. Ruth K. Freinkel as Assistant Resident in Dermatology for one year, beginning July 1;
Dr. Lester H. Grant as Assistant Resident in Medicine for one year, beginning July 1;
Dr. Guy W. Leadbetter, Jr. as Assistant Resident in Urology, beginning July 1;
Dr. David J. L. Luck as Assistant Resident in Medicine, beginning January 1, 1957;
Dr. Richard F. Mayer as Assistant Resident in Neurology for one year, beginning July 1;
Dr. Jack H. Mendelson as Assistant Resident in Psychiatry, beginning July 1;
Dr. John A. Mills as Assistant Resident in Medicine for one year, beginning July 1;
Dr. William L. Morgan, Jr. as Resident in Medicine for one year, beginning July 1;
Dr. Raymond L. Robillard as Assistant Resident in Neurology for one year, beginning July 1;
Dr. John C. Rowe as Resident in Medicine for one year, beginning July 1;
Dr. Arthur A. Sasahara as Assistant Resident in Medicine for one year, beginning July 1;
Dr. Katharine E. Spreng as Resident in Medicine for one year, beginning September 1;
Dr. Arthur H. Thayer as Assistant Resident in Anesthesia for one year, beginning July 1.

At their meetings during January, the General Executive Committee voted:

To accept the resignation of Dr. Melvin L. Taymor from the position of Clinical Assistant in Surgery and his duties in the Ovarian Disfunction Clinic.

To promote:

Dr. A. Robert Arnstein from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;
Dr. John R. David from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;
Dr. G. Richard Dickersin from the position of Third Assistant Resident to that of Sec-

---

* Cf. last report: *M.G.H. News,* May 1953

ond Assistant Resident in Pathology for one year, beginning July 1;

Dr. Thomas G. Gabuzda from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Charles S. Keevil, Jr. from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Allan B. McNie from the position of Third Assistant Resident to that of Second Assistant Resident in Pathology for one year, beginning July 1;

Dr. Allan I. Sandler from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Charles P. Summerall, III, from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. William M. Thurlbeck from the position of Third Assistant Resident to that of Second Assistant Resident in Pathology for one year, beginning July 1;

Dr. Sumner I. Zacks from the position of Intern to that of Third Assistant Resident in Pathology for one year, beginning July 1.

To reappoint:

Dr. Thomas C. Hall as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. Myron H. Matz as Clinical Assistant in Dermatology, as of October 1, 1955;

Dr. Ruth S. Weiss as Clinical and Research Fellow in Psychiatry, beginning January 1.

To appoint:

Dr. Rodman B. Finkbiner as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Verner S. Johnson as Clinical Assistant in Orthopedic Surgery for one year, beginning January 1;

Dr. Edwin P. Maynard, III, as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Joseph R. Petranek as Clinical and Research Fellow in Medicine, assigned to the Tumor Clinic, for one year, beginning September 1;

Dr. Bernard B. Stone as Clinical Assistant in Neurosurgery for one year, beginning January 1;

Dr. Claribel Westermeyer as Clinical and Research Fellow in Medicine, assigned to Allergy, for one year, beginning July 1.

Brief bits:—

Dr. Francis M. Ingersoll addressed the staff of the Memorial Hospital, Worcester, Massachusetts, recently. His subject was "Management of abnormal vaginal bleeding".

Dr. Chester M. Jones acted as Moderator of a panel discussion at the January 9 meeting of the Boston Surgical Society. The subject of the discussion was "Esophagitis, hiatus hernia, and carcinoma of the esophagus". Participants in the discussion were Drs. Herbert D. Adams, Edward B. Benedict, Franz J. Ingelfinger, Richard Schatzki, and Richard H. Sweet.

Dr. Robert R. Linton has recently been to Kingston, Jamaica, and Havana, Cuba. He spoke at the University Hospital in Kingston on "Arterial grafting procedures", and before the Pan American Gastroenterological Society in Havana on "The surgical treatment of bleeding esophageal varices".

At the Annual Meeting of the Radiological Society of North America, held in Chicago in December, an exhibit presented by Drs. Laurence L. Robbins and Chiu-chen Wang won a *cum laude* — one of three to receive the highest honor. The exhibit was entitled "Cushing's disease: Roentgen manifestations". A paper on the same subject was read at the meeting by Dr. Robbins. Dr. Robbins attended a conference at the Armed Forces Institute of Pathology, Washington, D.C., January 23-29, where he took part as a teacher.

Dr. Hermann B. F. Seyfarth announces the opening of offices for the practice of General Dentistry at 105 Mount Rose Street, Reno, Nevada.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
The subjective response and reaction to sensation.
Am. J. Med. 20:107-113.

Gastrointestinal Research

Ebeling, W. C., Bunker, J. P., Ellis, D. S., French, A. B., Linton, R. R., and Jones, C. M.
Management of patients with portal hypertension undergoing venous-shunt surgery.
New England J. Med. 254:141-148.

General Medicine

Knowles, J. H., Gorlin, R., and Storey, C. F.
Clinical test for pulmonary congestion with use of the valsalva maneuver.
J.A.M.A. 160:44-48.

Laboratory Science

Rosenberg, R. M., Lever, W. F., and Lyons M. E.
The interaction of human serum *beta* lipoprotein with certain small molecules.
J. Am. Chem. Soc. 77:6502-6505 (Dec. 20) 1955.
[This journal did not reach library shelves until too late for the above title to appear in the February issue of THE NEWS—the deadline issue for 1955 titles—hence the inclusion of the title this month.—*Editor*]

Neurology, Neurosurgery, and Psychiatry

Saslow, G.
Psychiatric problems of medical students.
J. Med. Ed. 31:27-33.

Neurophysiology

Brazier, M. A. B.
Neuronal structure, brain potentials and epileptic discharge.
Epilepsia 4:9-18.

* * *

Late in February 1955, my wife, five children, and I boarded the *Maasdam*, and ten days later turned into the Maas at the Hoek van Holland to dock a short time later at Rotterdam. During the next eight months, while my family absorbed as much of Holland as possible, I was to work with Professor Andries Querido as a guest member of the staff of the Academisch Ziekenhuis of the University of Leiden.

We were met at the dockside by Professor Querido, who spent 1949 as a Rockefeller Fellow in our own Thyroid Laboratory. He had arranged a pair of buses for transportation of family and baggage to a little vertical house in Oestgeest, a suburb of Leiden, which was our home for the rest of our stay. We viewed the house with misgivings when we learned that there was no central heating against a late Dutch winter, and no refrigeration; but we survived, and learned that survival is not only possible but even pleasant without many of the comforts and conveniences of Chestnut Hill.

Day-by-day living in Holland was pleasant indeed. Some aspects were particularly comforting to my wife. For example, the butcher paid three calls daily, once for orders and twice for delivery. The greengrocer called daily with his rig full of fresh vegetables, including peeled potatoes. A beach with a magnificent strand was only fifteen minutes away. Schools were close by and the streets swarmed with playmates of all ages for our children. Life was pleasant for me, too. The laboratory was five minutes from the front door, and with scarcely any intervening traffic except for the swarming bicycles. It was always possible to have lunch at home with the family. The academic atmosphere of scholarship and industry in Professor Querido's department was a never-failing source of satisfaction and stimulus.

There was always something for spare moments. Amsterdam, with its shops, museums, and theaters was only an hour away. The Hague was a half hour from our street, and Delft and Rotterdam were not much farther. Only ten minutes away, on the canal, with Dutch meadow and windmill beyond, was our favorite restaurant where we could have a glass of genever and a little later a rijstafel with thirty-five different courses from Indonesia.

The Academisch Ziekenhuis is near the center of Leiden, but isolated from the busy town by lawns and gardens. Each major department has its own building. There are advantages to this, but disadvantages as well, for it tends to keep the departments separated, and when a patient must go from one building to another he may do so through a few hundred yards of North Sea weather.

Much of the daily program of the hospital was familiar to a visitor from the Massachusetts General Hospital. Grand rounds and pathological conferences were held weekly. I was particularly struck by the excellence of the contributions from the X-ray Department. Case material was excellent and well presented. Discussions seemed at times limited to the more senior persons present, as is also too often the case with us. That important voice from the back row was seldom heard.

For a refugee from the basement of the Bulfinch, the most impressive aspect of work in Holland was space and cleanliness. Professor Querido's magnificent new quarters for his Department of Endocrinology and Metabolism are beautifully equipped and ideally suited for the fusion of clinical endocrinology and the laboratory sciences. A corridor lined by offices and the departmental library connects the ambulatory clinic for metabolic diseases at one end with the research and clinical laboratories at the other. On the floor above are the wards and metabolic beds. In the basement are animal rooms, animal surgery, photographic and charting shops, and more laboratories. There is even a staff for electronic engineering and instrumentation.

Professor Querido has managed to create a most pleasant atmosphere in his department. People work long hours, but the pace is a bit more relaxed than at the Massachusetts General Hospital. Even the members of the professional staff take a coffee break occasionally. Every Thursday there is a group clinic which is reminiscent of our own thyroid clinic or that of Dr. Albright. Case material is varied and thoroughly worked up. There is an excellent spirit of democratic inquiry. These meetings were particularly instructive for me, because the clinic includes all varieties of endocrine disease, including diabetes. Dr. Querido has been successful in broadening the resources of his clinic by promoting attendance of surgeons and gynecologists and, on occasion, neurologists and pediatricians.

The medical school is an integral part of the Academisch Ziekenhuis. It is difficult to draw parallels between medical education there and at Harvard. The system and structure of the curriculum are quite different. The major distinction seemed to be in the amount of didactic teaching given the Leiden student, the lack of individual instruction, and the lack of individual responsibility. Nevertheless, the student emerges from his educational experience as a reasonably qualified physician. From what I could determine, the standard of medical practice in Holland would well withstand comparison with the prevailing standards here. Even so, Professor Querido and his colleagues are making every effort to broaden and individualize the teaching program. One of the problems which hampers instruction is the lack of teachers. There is little or no utilization of the community physicians in the teaching program. There is interest in breaking this barrier between the academic and the practical, but the old patterns are difficult to alter.

One of the nice things about working in Holland was its central location. This made it possible for us to undertake quick trips to many places without major interruption of the schedule of work in the laboratory. Our first trip was for three days to London, where I visited Dr. Pochin in order to talk over some of his interesting results in the treatment of cancer of the thyroid. We stayed at the home of Mr. Selwyn Taylor, who was a Rockefeller Fellow here in 1949, and visited Dr. Rosalind Pitt-Rivers, who spent a year here in 1953-54 jointly with the thyroid group and Dr. Lipmann.

Our brief trip to Paris and another through the Moselle Valley and Luxembourg were conducted purely on the pleasure principle, but in July we were off to Scotland and England. In Glasgow we were the guests of Dr. Edward McGirr of the Royal Infirmary and of the Royal College for a talk under most elegant and frightening circumstances. Dr. McGirr visited the Thyroid Laboratory at the Massachusetts General Hospital for a month in 1954. We then saw Edinburgh, did some ancestor hunting in County Ayre, spent a day in the English Lakes district, and then a day in Oxford with Dr. Alexander Leaf. From there we explored Cambridge and the Cam, and finally attended an excellent three-day conference on calcium at Ciba House in London.

Our last big trip was to Scandinavia. In Copenhagen we visited the Carlsberg Laboratories and Dr. Thorkild Friis, who is now at the Massachusetts General Hospital. Across the Öresund in Malmö we had a pleasant day with Bengt Skanse and his wife. Dr. Skanse was with the Thyroid Laboratory here from 1946 to 1948. His new laboratory in the Allmanna Sjukhuset is wonderfully equipped. In Stockholm we paid a brief call at the Carolinska Hospital and Institute and saw more laboratory equipment assembled in more ample and beautiful surroundings than I could have imagined.

Apart from Holland, Finland proved to be our favorite country. We stayed with friends fifteen miles from Helsinki on the Baltic, and went into town only for a shopping tour and a talk at the Finnish Endocrine Society, whose president, Dr. Uotila, was at Harvard Medical School some years ago. Several old friends of the Massachusetts General Hospital were at the talk. It was particularly good to see Dr. Kalervo Ohela, who spent the first half of 1954 in the Thyroid Laboratory. Finland is like the best of Maine: rivers, forests, and lakes. Most pleasant of all was a long automobile trip up through the center of the country, with smoked reindeer for lunch, a Finnish sanna (steam bath) and dip in the Baltic when we returned, and dinner on crayfish and schnapps with our hosts and their guests, Dr. and Mrs. Ohela, Dr. and Mrs. Lamberg, and others. Dr. Lamberg comes to the Thyroid Laboratory this fall.

After our return from Scandinavia the pressure of work in the laboratory precluded any but the briefest trips. In September we took a quick turn around the Ijsselmeer (formerly the Zuider Zee), the inland sea which is being pumped dry for farmland, exploring some of the villages and unfrequented spots like Urk and Spakenburg where the traditional costumes still survive. In October we had a day in Brussels for a talk in the department of Professor Bastenji at the University.

Our months in Holland suddenly became a glowing memory late in November when Pan American transplanted us over night in Boston. We arrived at home with many fresh appraisals of our work and our values, and with only the warmest affinity for Holland and the Dutch. We have already calculated the earliest possible moment when we can return.

John B. Stanbury, M.D.,
Assistant Physician

BACTERIOLOGY LABORATORY

Although the conquest of infectious diseases was widely proclaimed in quasi-scientific periodicals coincident with the introduction of new antibiotics in the late 1940's, subsequent experience has refuted such premature reports of the decline of the microbial diseases. Experience, rather, has emphasized the importance of a more careful and penetrating evaluation of bacteriologic laboratory science in the treatment of infectious diseases with the new antibiotic agents. Hence, the infectious diseases which are now amenable to antibiotic therapy should put greater demands on the bacteriology laboratory and on the clinician's intelligent use of it, if the great promises of the conquest of disease are to be fulfilled in specific instances.

This increasing emphasis on the prudent use of antibiotics has, in part, accounted for the almost doubling of the number of examinations performed in the Hospital bacteriology laboratory in the last three years, and is more accurately reflected in the fact that antibiotic sensitivity testing has tripled during the same period. However, sensitivity tests and the additional examinations, requested by physicians because of their concern for the dynamics of the host-parasite relationship, are responsible for only part of the increased use of the diagnostic bacteriology service. Changes in hospital admission policies and other factors which have tended to increase the patient census likewise have placed further demands on the laboratory, as has been the case with other ancillary services.

It is to be expected, then, that the bacteriology laboratory has met the added call on its services by increases in its staff and by expansion of facilities to the point where, as with most other service units, it approaches the time when physical expansion must be considered. In the meantime, more efficient use of existing space and the employment or training of competent laboratory technicians seem to have satisfactorily solved these problems for the time being.

The shortage of adequately trained technicians is perhaps most pressing and is a perennial problem. In this respect, we are constantly indebted to Miss Marguerite E. Burke, Head Technician, whose long experience and faithful service have made it possible to train qualified candidates who lack only practical training and experience to become good laboratory technicians. That these technicians can be trained without compromising the quality of the work performed in the laboratory is a tribute to Miss Burke, who usually has at least one neophyte technician in addition to one or more members of the house staff under her guidance. Also responsible for the maintenance of the high standards of performance of the laboratory is Dr. Louis Dienes, Consulting Bacteriologist and formerly Hospital Bacteriologist, on whose advice and experience we not infrequently depend.

Recognition must also be given to the Hospital Administrators, who have made available not only the resources by which the increasing work load could be sustained by the laboratory without a corresponding decrease in the quality of performance, but also the means by which services could be extended and improved in certain areas during the period of expansion. A typical example of this cooperation is the recent establishment of a mycology-T.B. section within the bacteriology laboratory. The Administration recognized the advisability of establishing a special tuberculosis-mycology section in order to provide at the laboratory level a more logical association of these two groups of microorganisms by a specially trained person. One of our senior technicians, Miss Marilyn Holland, attended a special course in Mycology at Duke University, and subsequently a separate laboratory was furnished and equipped to permit closer attention by Miss Holland to the examination of clinical specimens for both fungi and acid fast bacteria. After only a short period of operation, tangible results are already being noted, although it will be some time before this improved service will become noticeable on the ward level. Further efforts in this area will continue to be expended so that the bacteriologic diagnosis of the granulomatous diseases will be improved — a source of constant dissatisfaction because of the long time it takes for these slowly growing organisms to become apparent in the laboratory.

It is to be taken for granted that any routine performances in an institution like the Massachusetts General Hospital should be at a high level of competence. In other words, it is expected that excellence be routine and that the "routine" be excellent at the M.G.H. Assuming, then, that the routine performances of the bacteriology laboratory are at a high level of competence, greater attention must be paid to improvements relating to the extraordinary bacteriological problems in the Hospital in order to make the laboratory outstanding according to MGH standards. To this end, in addition to constantly reviewing and revising our routine procedures, special emphasis has been placed on these extraordinary events which are not easily encompassed by the ordinary procedures of a diagnostic bacteriology laboratory.

This *modus operandi* has led to an attempt on our part to collate information and services relative to infectious diseases in the Hospital and in the community, and to try to effect, in this respect, a closer collaboration between the Hospital on the one hand, and the Medical School, State and Federal Public Health services and other cooperating laboratories on the other. In short, we have attempted to a modest degree to act as a link between the ward and the laboratory and between the Hospital and outside agencies in relation to infectious diseases.

Such an understanding has indeed become necessary on a practical basis because of the development of complex and expensive diagnostic tests which are impractical to perform even in a general hospital laboratory, but which are available to us through State and Federal laboratories on a routine basis, and through the laboratories of colleagues on a personal basis. This collaboration, consequently, has us collecting and storing acute phase sera, providing forms required for certain tests, collecting clinical information required by some laboratories, transmitting specimens to the appropriate laboratories, and seeing that the results of such tests are reported to the interested physicians and inserted in the patients' records. It finds us arranging for certain tests to be performed in research laboratories, inquiring about the incidence in the community of diseases suspected in certain patients, giving epidemiological leads to Public Health officials, and supplying the latter with helpful information on request.

At times, it has been practical to attempt more complicated laboratory diagnoses in the Hospital laboratory because of the research interests of the staff and the availability of the necessary facilities. A fair amount of success, for instance, has been achieved in isolating etiologic agents in cases of certain virus diseases. Similarly, it has been possible to prepare skin test antigens for cat scratch disease from material obtained from MGH patients. These have been assayed through the cooperation of clinical associates and made available for testing MGH patients as well as patients in many other hospitals in New England and other parts of the country.

It is felt that more of this type of work can be done in the Hospital, and the advisability of extending these techniques is being explored. Although it will probably not be practical to perform diagnostic serological tests for virus diseases of individual patients (inasmuch as they are "routine" in Federal Public Health laboratories), it will most likely be feasible to study certain interesting cases and to investigate outbreaks of disease among Hospital personnel or patients when circumstances warrant investigation. Such studies have been done occasionally in the past, as will be described below.

Moreover, it is certain that more extensive use can be made of the volumes of data which get buried in the form of laboratory test results in the course of time. To this end, we are examining the practicability of putting all laboratory data on business machine cards from which it would be a simple matter to extract a variety of statistics which might prove useful for many purposes. Several examples of this type of salvaging of data may be given to illustrate the possible value of such a procedure. For instance, last year an analysis was made of the serological classification of Salmonellae isolated in the Hospital during the previous two years. These data had fortunately been collected in a separate file, obviating the necessity of fumbling through some five thousand laboratory reports. From the analysis it was determined that the Widal test might be used more profitably in a modified form since we had encountered no infections by Group A Salmonella which, nevertheless, was represented in the Widal test during that period. On the contrary, 63% of the Salmonellae isolated from patients had Group C Salmonella antigens which were not being used in the classical Widal test employed in the laboratory during the same period. Accordingly, in April of last year, we modified the Widal test, making it possible now to detect antibodies elicited by Salmonella organisms of Group B, Group C (which includes the important, invasive S. cholerae suis), and Group D which includes the typhoid organism.

Further instances of the value of easily collated data may be derived from the reports, circulated periodically by the laboratory among Hospital physicians, of the relative sensitivities to antibiotics of organisms isolated from MGH patients. The results of our routine sensitivity tests comprise a mass of data which accumulates and gradually gets buried in our files. It was felt that such information pertaining to organisms which are associated with chronic or intractable infections may be of some interest to physicians confronted with such infections, provided the information were collected, tabulated, and summarized. Although such reports which are now circulated about twice a year seem to be received with interest by some of the staff, it still remains a tiresome chore to collect the data manually rather than by an efficient time-saving machine.

A final example of the usefulness of readily available data is illustrated in an epidemiological investigation of the several cases of salmonellosis which occurred in the M.G.H. On examination of the separate file of Salmonellae in the bacteriology laboratory, it was noted that several of the infections seemed to have occurred in patients who were hospitalized at the time of onset of symptoms, which indeed proved to be true. Further investigation absolved personnel as a common source of infection for these patients and suggested that an infected food may have been the vehicle of transmission. Cultures of dried inactive yeast (brewer's type) used in tube feedings of the patients revealed the presence of three different serological types of Salmonellae and the source of the infections. In the absence of a device for segregating the original laboratory reports, it is possible that the source of these infections may have been neither investigated nor uncovered. How many other interesting and important experiences lie buried which might be brought to light by better control of such data remains to be determined.

It might be of interest to recall briefly the participation of the bacteriology laboratory during the acute emergency that ensued consequent to the polio epidemic in Massachusetts in 1955. Because of the large number of patients with respiratory difficulties, the shortage of professional personnel on the wards, and the need for constant bacteriological surveillance, a special section of the laboratory was temporarily set up on White 9 in charge of a second year medical student, John Livingstone, who, fortunately for us, had been working in the bacteriology laboratory during the summer. This temporary expedient made it possible to keep an up-to-date account of the bacterial flora of these patients who were under continual risk of contracting complicating bacterial infections. At the same time the house staff and nursing service were relieved of the necessity of collecting specimens and obtaining preliminary reports of the previous day's cultures. During this period considerable interesting bacteriological data were amassed which Mr. Livingstone is in the process of analyzing for future reference. At the very least, it would seem that the extensive bacterial examinations which were made will contribute to our understanding of the ecology of bacterial flora of hospital areas and of patients occupying these areas for extended periods of time.

In addition to the clinical bacteriologic research of the type mentioned above, research activities of a less immediately practical nature are being pursued in the bacteriology laboratory. Dr. Dienes, a member of the arthritis group, continues to study the L form, its relationship to parent bacterial forms and its possible implications in disease. Drs. John T. Sharp and John Ward, also of the arthritis group, are also exploring the L forms. Dr. Thomas C. Peebles of the Children's Medical Service is continuing his research on the virus of measles in tissue cultures of human tissues, being interested particularly in the viremic phase of measles and the mechanism of carriage of the virus in the circulation.

The tissue culture laboratory also attracts the attention of Dr. Lawrence J. Kunz as a device for exploring the etiology of certain diseases presumed to be of virus origin. At the same time, he is testing the effect of ultraviolet irradiation of cells in tissue culture with a view toward liberating masked viruses or causing mutations of cells, which may merely be two ways of describing the same phenomenon. The presence of these several avenues of research in the bacteriology laboratory provides not only a diversity of interests which is both stimulating and productive, but also makes available extraordinary techniques which are adaptable to more extensive bacteriologic diagnostic procedures.

At the time of this writing, the laboratory and the staff look forward to the return to M.G.H. of Dr. Morton N. Swartz, who will assume the position of Chief of Infectious Diseases. Dr. Swartz will bring with him a different research interest and will also provide a closer link between the laboratory and the wards in his capacity as clinical consultant in infectious diseases. In this connection, also, informal plans have been discussed for the house officers' training program in Bacteriology whenever it becomes possible to resume this practice. Consideration has been given to a proposal whereby an infectious disease resident would be assigned to Dr. Swartz in the place of a bacteriology resident. Formerly, the time spent on this rotation was designated as laboratory time. Under the new proposal, this rotation will involve rounds of infectious disease patients correlated with work-up by the resident of cultures pertaining to the patients seen on the wards. In this manner, greater significance of the laboratory side of the infections can be imparted and the training of the individual resident extended to other house officers on the service by discussions between the latter, the infectious disease resident, and Dr. Swartz.

It was hoped that this biennial report of the activities of our bacteriology laboratory could be delayed until the arrival of Dr. Swartz, so that his plans and viewpoints could be included. Because of the schedule of publications by THE NEWS, however, we will have to wait until another time when Dr. Swartz can give his progress report.

In conclusion, we continue to invite from all who may be interested in the bacteriology laboratory, comments, criticisms, and suggestions for improved service. Furthermore, if you think that your patient presents special problems which cannot be adequately handled by a routine treatment of specimens or cultures, you are urged to visit the laboratory on the fourth floor of the Domestic Building and discuss possible methods which might provide the answer to your questions.

Lawrence J. Kunz, Ph.D.,
Head of Bacteriology Laboratory

MASSACHUSETTS EYE & EAR INFIRMARY

The election of officers for the coming year took place at the 428th meeting of the New England Ophthalmological Society, held at the Infirmary on January 18. The new officers include Dr. Edward A. Cramton, President; Dr. Virgil G. Casten, Vice-President; Dr. Edwin B. Goodall, Secretary; and Dr. John M. Hill, Recorder. These officers will not take up their duties until after the April meeting of the Society. At the January meeting Dr. Albert E. Sloane gave his second lecture on "The management of subnormal vision".

The Annual Meeting of the New England Oto-Laryngological Society was held on February 8 in the Upper Amphitheatre of the Massachusetts General Hospital. Following the regular Wednesday morning clinical conference, seven New England doctors presented papers to the group. Guest speaker at the evening banquet was the Reverend John P. Fitzsimmons, former Supervising Chaplain of the Flying Tigers, under General Chennault.

The Haut-Collège International pour l'Étude des Langages, Faculty of Sciences, University of Paris, has elected Dr. George Kelemen to be a Président Général Adjoint for the special branch of Comparative Anatomy and Physiology of the Larynx.

Eighteen doctors, including 2 from Mexico and 1 from Brazil, are attending the Harvard Medical School postgraduate course in an introduction to clinical ophthalmology. These students have recently completed a 3½-month basic science course at Harvard. This is the 11th year since the war that the course has been given. It consists of lectures, demonstrations, and exercises. Techniques of examination are also taught, with the students themselves as subjects. The course is being held in the new project laboratory on the 6th floor of the Infirmary, from January 16 to March 3. Dr. Henry F. Allen is director of the postgraduate program, and there are 45 instructors—mostly from the Infirmary staff.

Dr. David D. Donaldson has recently organized a group of 33 stereoscopic goniophotographs. Sets of these slides, together with a descriptive book, are being distributed at cost to various teaching institutions throughout the country, in-

No. 58 in a series of Staff photographs

Lawrence J. Kunz, Ph.D., Assistant Bacteriologist—Head of Bacteriology Laboratory

cluding the University of California at San Francisco and the University of Ottawa.

On January 26, Dr. Donaldson spoke to the Biological Photographic Society in New York. His subject was "The use of stereoscopic photography in the medical field".

Dr. LeRoy A. Schall took part in a symposium at the sectional meeting of the American College of Surgeons in Philadelphia on February 15. The subject of the symposium was "Surgery of the larynx", and Dr. Schall discussed "Surgery of the neck after external irradiation".

Dr. George F. Reed presented a paper at the Eastern Section meeting of the American Laryngological, Rhinological and Otological Society on January 13. In this talk on "Neck dissections" Dr. Reed noted, "If the metastatic lymph-nodes were removed while the nodes were small there was an 85% survival rate, but if the nodes were allowed to enlarge the survival rate was only 5%. This points out the extreme importance of detecting these nodes early."

Dr. Matthew D. Davis has been appointed as Fellow in Ophthalmology, assigned to the Retina Service, for six months, beginning January 1.

At a meeting of the Executive Committee, held January 16, the following votes were approved:

Dr. Henry F. Allen — promoted to the position of Assistant Surgeon in Ophthalmology;

Dr. Bernard H. Zeavin, Assistant in Ophthalmology — granted leave of absence for military duty, beginning as of January 1.

New addresses:—

Dr. Peter R. Bally (a.r.p. 1956), Peter Bent Brigham Hospital, 721 Huntington Ave., Boston 15, Mass.

Dr. Richard T. Barton (*Otolar.* 1945), 9730 Wilshire Blvd., Beverly Hills, Calif.

Dr. Martin J. Bellinger (clin. a. *S.* 1949), Professional Bldg., 114 Waltham St., Lexington, Mass.

Dr. John T. B. Carmody (a.r.s. *N.S.* 1936), 65 Elm St., Worcester, Mass.

Dr. Francis L. A. de Marneffe (a.r.p. *Psychiat.* 1952), 274 Commonwealth Ave., Boston, Mass.

Lt. Gerald M. Edelman, MC, USAR (*M.* 1955), 386 General Dispensary, Paris, France, APO 128, c/o Postmaster, New York, N. Y.

Mr. Raymond V. Kinsman, Superintendent of Works, Western Pennsylvania Hospital, 4800 Friendship Ave., Pittsburgh 24, Pa.

Dr. Si Chun Ming (r.p. *Path.* 1956), Beth Israel Hospital, 330 Brookline Ave., Boston 15, Mass.

Dr. William D. Shorey (*E.S.* 1946), 59 East Madison St., Chicago 3, Ill.

Dr. James H. Townsend (*W.M.* 1923), U.S. Veterans Administration Hospital, 150 South Huntington Ave., Jamaica Plain, Mass.

Dr. Roger E. Wilcox (*S.* 1949), 107 Wilson St., Beckley, W. Va.

This fine letter has come from Dr. Howard Boyd (*C.M.* 1922), our "singleton" in Manchester, Connecticut — an alumnus who thought he didn't have anything interesting to tell us about himself:

> I ignored your former note because I couldn't think of anything about me that might be of general interest. Now that you write again, I shall give you a few details which you may use as you see fit, cutting out the unimportant parts.
>
> Just before coming to Massachusetts General Hospital I married Janet Mandell, a Peter Bent Brigham nurse. We have four daughters, all of whom are married. There are five grandchildren.
>
> After leaving M.G.H. I was at Hartford Hospital for 20 months and then at Manchester, Connecticut, in general practice for 10 years. During this period I organized the Department of Pediatrics at the Manchester Memorial Hospital, where I am still chief. The next 10 years of my practice was limited to medicine at any age. In this period I was elected a Fellow of the American College of Physicians, which recognized both internal medicine and pediatrics. The remaining years have been limited to the practice of pediatrics. Four other pediatricians have now joined me, so that we have a very active and enjoyable department. At present I am Chairman of the Department of Pediatrics of the Connecticut State Medical Society.
>
> I try to attend all of the meetings of the New England Pediatric Society at Boston and thus maintain my friendships.
>
> When I took a refresher course with Dr. Nathan Talbot, I was impressed by how much the M.G.H. had improved since I was there.

All of the many friends of Dr. William H. Trethowan (a.r.p. *Psychiat.* 1951) will be interested in this letter from him, written from Manchester, England:

> You have been kind enough to write to me on several occasions, requesting news of my activities for publication in The News. The last occasion (a reminder!) was, I am almost horrified to find, as long ago as last July. I must apologize for being so remiss. My only excuse is that things have seemed to be very much as usual. However, I am about to take up a new appointment and it strikes me that this might conceivably be of interest to some of my old friends and colleagues.
>
> I have been appointed Professor of Psychiatry at the University of Sydney, N.S.W., Australia, together with which goes the appointment of consultant psychiatrist to the Mental Health Services of New South Wales and the clinical directorship of Broughton Hall — a 200-bedded acute hospital for voluntary patients. This is a great venture for me, but certainly an exciting one. Although it brings me no nearer to Boston, paradoxically it may give me a better chance to see you all again, as Sabbatical leave ("Once every seven years or thereabouts" — as it is so worded) will give me the chance to travel, and you may be sure that Boston, and especially the M.G.H., will be on the itinerary. We sail on April 12 and in doing so will not regret exchanging the "smog" of Manchester for the sun and sea air of Sydney.
>
> Best wishes to you and all at the M.G.H. for 1956.

THE NEWS

No. 155 Boston, Mass. April 1956

BRAIN WAVE LABORATORY

In January 1951, THE NEWS carried an account of this laboratory and the work that was going on in it. This, therefore, represents a sequel with approximately a 5-year interval between the two reports.

When the laboratory was started in 1937, it was supported by the Departments of Neurology, Neurosurgery, and Psychiatary. As a result of this combined support it never fell strictly within one of these 3 departments and developed a type of autonomy which made it appear as if it were a separate department within the Hospital. All of its staff, however, were associated with neurology or psychiatry by their Hospital appointments, and this arrangement functioned fairly well for the first 14 years of its existence. Because of this partial autonomy and lack of identification with any specific department it was difficult to obtain adequate research funds under certain situations.

In July 1951, the Neurology Department was taken over by Dr. Raymond D. Adams, and the laboratory was wisely placed within his Department of Neurology exclusively and with him exercising full responsibility for it. No better arrangement could possibly have been made, in the eyes of its present director, since the entire background of the clinical utilization of the electrical recording of brain impulses properly belongs within the neurological field. There has been a noticeable improvement in the laboratory's ability to serve and coordinate its resources within the Hospital, and also to obtain research assistance when required, since this arrangement took place.

Although it is quite customary to accept the abbreviation "EEG" in this Hospital as specific for the electroencephalographic examination, not everyone understands it in the country far distant. For example, an elderly farmer was sent down from northern Maine because he was having considerable difficulty with his eyesight. His physician recommended that he spend a morning at the Ophthalmology Department of the Eye and Ear Infirmary for refraction, hoping he would obtain a better pair of spectacles. However, he turned up at the Admitting Desk of the Massachusetts General, with a slip in his hand on which "Eye" was scribbled so illegibly that the Admitting Clerk understood it to read "EEG". He was taken to the laboratory where a complete study was made, including the flashing of the stroboscopic light in his eyes, when both opened and closed, while he was lying on a bed. At the end of the examination, this very puzzled farmer asked the technician about his glasses, which were on a table beside him during the test. She returned them to him, stating, "These are yours, all right"; and he, sorely puzzled, went back to Maine. What he told his physician is not quite known, but the latter's letter indicated a good degree of misunderstanding.

Since 1951, the laboratory space has not been enlarged or altered; but in the summer of this year (1956), the entire laboratory will move into new quarters in the new Medical Science Building. In this new location, we expect to have a more efficient layout of space, so that it will not be necessary for patients to wander through the room where the apparatus is in order to reach the examining room. Bed and litter patients will be able to get prompt attention without the necessity of moving filing cabinets, etc. Furthermore, the new laboratory rooms will be shielded against electrical interference in the most modern manner; and the electrical power to run the various pieces of apparatus will be free of the alterations and artifacts that sometimes occur. We expect to have new electroencephalographic amplifiers in the new building, which will make the running of tests more efficient and, perhaps, more rapid.

In the previous laboratory report, we commented specifically on the gradual increase in the number of patients over the years. At the present time, the annual turnover has reached a fairly stable value of approximately 3500 examinations per year. However, the amount of time spent on each examination has gradually increased because of the development of new techniques of bringing out abnormalities. For instance, in 1950 we developed and built in the laboratory a very practical and efficient stroboscope for flashing a bright light in the eyes of the patient during a test. These are now produced commercially and are used elsewhere. In 1950, the stroboscope was applied in only 10 percent of the patients, compared to 90 percent at the present. In 1950, sleep as a form of activation was used perhaps once a week. Now, at least 2 such examinations are made each day, and, in the new quarters where special arrangements will be available for sleep study, we expect to do more. In 1950, the procedure was utilized in the operating room perhaps 5 times a year. At the present time, recording the brain discharges in the operating room, from the exposed brain, to aid the surgeon in identifying an epileptic focus, occurs once a month; but a new development has occurred in the operating room.

In surgical procedures which may last the entire day, the electroencephalogram monitors the operation along with other electrical and mechanical aids of the Anesthesia Department. It assures the continued presence of normal electrical brain activity — a requirement which is a critical part of the procedure. Such is the case in operations where the patient's body temperature is lowered 15-20 degrees in order that an aneurysm or diseased brain artery can be replaced by healthy tissue. It is hoped that in the near future the same kind of monitoring of the brain's electrical activity during some of the intricate surgery of the heart will aid the surgeon in preventing or becoming aware of the very first signs of deficient brain circulation that may result from certain parts of these procedures.

As mentioned in 1951, we were one of the first laboratories in this country to have an automatic wave analyzer as part of our routine equipment. The unit was purchased by the United States Navy, which was supporting some of the research in the laboratory. For 9 years this very complicated and exceedingly expensive electronic machine functioned, but it finally expired after a series of hopeless breakdowns in 1954. Before the new laboratory opens, we hope that a much more efficient and less complicated wave analyzer will be in operation. It is, at present, still in the construction stage at the manufacturers.

In August 1953, there occurred at Radcliffe College in Cambridge the 3rd International EEG Congress. Our laboratory was one of the principal hosts in organizing this Congress, which was attended by nearly 600 persons from all parts of the world. The secretary-general was Dr. Robert S. Schwab; the treasurer, Dr. Mary A. B. Brazier; and one of the laboratory's secretaries, Mrs. Freda Clark, was the official Congress secretary. Dr. John A. Abbott was in charge of all arrangements. Other members of local committees were Dr. William H. Timberlake and Dr. Morris E. Chafetz; our nurse, Mrs. Sylvia Walker; our secretary, Miss Teresa Delaney; our head technician, Mr. Angelo Bonazzi; and the Misses Eliott, Garvey, Gray, Peterson, and Potts.

One of the first 15-channel French EEG machines, on display at the Congress, was acquired by our laboratory. Since that time, American manufacturers have gone into the production of such large units and they are no longer a rarity.

In the same year as the Congress, a new Laboratory of Neurophysiology, under Dr. Mary A. B. Brazier, was opened as part of our general setup within the Department of Neurology. Dr. John S. Barlow is her assistant. Very elaborate and efficient recording equipment was set up in this new laboratory. Access to the autocorrelator at the Massachusetts Institute of

Technology was also effected, so that the recording of simultaneous and other electrical events closely linked in time can be accurately sought out by this technique. As with any new procedure, its first applications are in collecting information about animals; and later on we would expect that a number of the unanswered clinical questions associated with electrical activity of the brain may be cleared up by the use of this equipment. Its clinical application already seems to be promising.

In the same laboratory with the EEG machines, we have developed and used regularly other types of equipment, such as ergographs, electronic stimulators that produce painless ergograms (electronic ergograms), tremor recorders, etc. We have also continued to record the muscle potentials (electromyograms), collaborating with the Department of Physical Medicine. Dr. Arthur L. Watkins has one of our units in his laboratory at the present time, and we use our own cathode ray equipment for this purpose. We were the first in this area to apply the Polaroid camera which gives a developed picture in one minute to clinical electromyography.

Our staff now shares the time of Dr. Mary Louise Scholl, a pediatrician, who spends her afternoons at the Epilepsy Center EEG Laboratory at the Children's Medical Center. This gives us an excellent liaison there. Dr. Albert C. England, Jr. joined us in the fall of 1955, after a year of part-time work in the laboratory.

We have always trained technicians and physicians in our laboratory, and have continued to do this since the last report. There are usually 2 technicians in training for a period of 6 months at a time, all day, and such trainees usually obtain positions in laboratories throughout the country. They must pass monthly examinations and a final examination before the Hospital certificate is given to them. A number of clinical men have spent 6 months or so in the laboratory in the past 5 years, and they constitute a growing alumni.

Members of the laboratory staff are closely associated with both the national and regional societies in electroencephalography, as well as the editorial board of the special quarterly called the *EEG Journal*. Dr. Schwab was secretary of the American EEG Society for 3 years, beginning with its formation in 1947, and then was president in 1950. He is an associate editor of the *EEG Journal* and one of the vice-presidents of the International Federation of EEG Societies. Dr. Brazier was treasurer of the American EEG Society from its beginning until 1954, when she was made president. She is the treasurer of the International Federation of EEG Societies and an editor of the *EEG Journal*. Dr. Abbott was secretary of the American EEG Society for 3 years and president of the Eastern Association of Electroencephalography.

We are now nearing our twentieth birthday, and at the present time both the staff and the patients of this Hospital regard the EEG examination in the same way as any other laboratory test. It has lost all its novelty and mystery. On the other hand, there are still new facets of our technique of which others are unaware. For the first time in the history of courts, in May 1955, one of our microfilms of an EEG record was introduced and projected on a screen in a Superior Court in New Hampshire.

In closing this report, the author wishes to state once more, in as strong terms as he can, that this electrical test of the function of the human brain can contribute very little, by itself, in a diagnosis; but when it is closely integrated, as it is in this Hospital, with the other physical and laboratory procedures, it can be of true value in establishing a diagnosis and even in helping with therapy.

Robert S. Schwab, M.D.,
Neurologist

The Board of Trustees, at their meeting on February 17, voted:

To accept with regret the resignation of Dr. Robert H. Talkov from the position of Assistant in Medicine.

To appoint:

Dr. John T. Pollard, Jr. as Second Assistant Resident in Radiology, beginning January 1, 1957.

At their meetings during February, the General Executive Committee voted:

To promote:

Dr. Fleming McConnell to the position of Resident in Radiology, effective as of January 1;

Dr. Paul M. Veazey from the position of Intern to that of Assistant Resident on the Children's Medical Service for one year, beginning July 1.

To reappoint:

Dr. Jimmie C. Brockman as Clinical and Research Fellow in Psychiatry, for the period January 1 through June 30;

Dr. Bryan Williams, Jr. as Clinical Assistant in Medicine for one year, beginning March 1.

To appoint:

Dr. Karl-Erik Aström as Clinical and Research Fellow in Neurology for one year, beginning March 1;

Dr. Peter R. Bally as Clinical Fellow in Medicine for one year, beginning February 1;

Dr. Noemi Della Bella as Research Fellow in Surgery, effective as of February 1;

Dr. Walter B. King, Jr. as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Willem deK. Kruger as Fellow in Anesthesia for one year, beginning November 1;

Dr. Thomas E. Macnamara as Clinical Fellow in Anesthesia for one year, beginning October 1;

Dr. Phyllis MacNeil as Clinical Assistant in Surgery, assigned to the Tumor Clinic;

Dr. Jacob S. Mager as Research Fellow in Biochemistry for one year, beginning September 1;

Dr. Carol Meyers as Graduate Student Assistant on the Orthopedic Service, for three months, beginning February 13;

Dr. Olcay R. Neyzi as Clinical and Research Fellow on the Children's Medical Service for one year, beginning February 1;

Dr. Nelson L. Portnoy as Clinical Assistant in Urology;

Dr. Claus W. Reichle as Fellow in Anesthesia, effective as of January 1, 1957;

Nathan Sharon, Ph.D. as Research Fellow in Biochemistry for one year, beginning September 1;

Dr. Praphreut Thirakhupt as Graduate Student Assistant in Surgery, for the period February 1 through July 31;

Martha S. White, Ph.D. as Research Fellow in Psychology for one year, beginning February 1.

Miss Jean Ervin has been appointed Supervisor of the Occupational Therapy Department.

* * *

The Simmons College School of Science and the Massachusetts General Hospital recently announced a new program of training in medical technology, which will lead to a bachelor of science degree.

The original request that Simmons College consider such a program was made by Dr. Dean A. Clark, and both he and the Director of the School of Science at Simmons, Dr. John A. Timm, agreed that such a program would help fill the need for more properly trained medical technologists.

The program has been approved by the American Medical Association's committee on hospitals and education. Co-directors of the program will be Dr. Benjamin Castleman, our Chief of Pathology, and Dr. Charles H. DuToit, Director of our Chemical Laboratory.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Gastrointestinal Research

Benson, J. A., Jr., Chandler, G. N., Vansteenhuyse, F. E., and Gagnon, J. O.
Studies concerning the site of fat absorption in the small intestine of the rat.
Gastroenterology 30:53-61.

McDermott, W. V., Jr., Bartlett, M. K., and Culver, P. J.
Acute pancreatitis after prolonged fast and

subsequent surfeit.
New England J. Med. 254:379-380.

General Surgery

Scannell, J. G.
Medical progress: Thoracic Surgery
New England J. Med. 254:271-279.
Wight, A., Hopkirk, J. F., and Cope, O.
Metabolic derangements imperiling the perforated ulcer. IV. Derangements of nitrogen metabolism and the nitrogen deficit.
A.M.A. Arch. Surg. 72:336-345.

Neurology, Neurosurgery, and Psychiatry

Lindemann, E.
The meaning of crisis in individual and family living.
Teachers College Record 57:310-315.
Murphy, J. T., and Schwab, R. S.
Diphenylhydantoin (Dilantin) sodium used parenterally in control of convulsions: A five-year report.
J.A.M.A. 160:385-388.

Neurophysiology

Brazier, M. A. B., Hamlin, H., Delgado, J. M. R., and Chapman, W. P.
The persistence of electroencephalogram effects of pentothal.
Anesthesiology 17:95-102.

MASSACHUSETTS EYE & EAR INFIRMARY

Graduate and undergraduate students from Boston University and Northeastern University are at the Winthrop Foundation every day doing clinic work as part of their educational courses. This student program, under the auspices of the educational staff of the Winthrop Foundation, is a good example of the increasing cooperation between local colleges and the Infirmary.

While working at the Foundation, the students have an opportunity to observe diagnostic procedures and rehabilitation in its various phases. They learn that there are many approaches, other than medical, to hearing problems. Some of the patients, for example, need psychological help or the assistance of a social worker to straighten out their educational or personal problems. At the Winthrop Foundation the staff members work as a team to help the patient in both medical and educational aspects.

This is the second year that Northeastern students have had a course on "The nature, management, and special education of exceptional children". This course is designed to give greater understanding and insight into many problems of the exceptional child, including speech and hearing disorders, vocational problems, and delinquency. Their clinic work takes place at the Winthrop Foundation, where they observe patients. Course instructors are Mr. Alan Feldman, Speech Pathologist and Audiologist, and Mr. Robert L. Berk, Educational Psychologist.

For the first time, Boston University students are also participating in clinical observation. Enrolled in a course on "Diagnostic hearing testing", taught by Mr. Feldman, these students also have an opportunity to give hearing tests.

Both groups of students are able to sit in on the discussion of individual cases at the weekly staff conferences of the Winthrop Foundation. This program is of special interest to those who, in their professional work, will be concerned with one or more aspects of the exceptional child.

The New England Ophthalmological Society held its monthly meeting at the Infirmary on February 15. Dr. Frederick H. Verhoeff, Consulting Chief of Ophthalmology, spoke on "Are Moore's lightning streaks of serious portent?". In his third, and concluding, lecture on "The management of subnormal vision" Dr. Albert E. Sloane gave a summary of the methods and technical aids that are being used at the Infirmary to help persons with subnormal vision.

Dr. Edwin B. Dunphy has been re-elected to the Board of Directors of the National Society for the Prevention of Blindness. Dr. Dunphy will serve a three-year term for this organization, which is devoted to sight conservation.

Dr. Dunphy gave the Charles H. May Memorial Lecture before the Section of Ophthalmology of the New York Academy of Medicine on March 19. His subject was "Radioactive isotopes in Ophthalmology".

On April 27, Dr. Dunphy will give a paper on "The role of radioactive phosphorous in the diagnosis of ocular malignancy" before the Ophthalmological Society of the United Kingdom, in London, England.

The Pan-American Congress of Otorhinolaryngology and Broncho-Esophagology will hold a four-day meeting at the Caribe Hilton Hotel in San Juan, Puerto Rico, beginning April 8. Among the outstanding speakers from both parts of the American hemisphere who will participate in the scientific program will be several members of the Infirmary staff. Dr. LeRoy A. Schall will speak on "Laryngeal surgery after irradiation failures"; "Mechanics of congenital deafness" will be Dr. George Kelemen's subject; and Dr. Robert L. Goodale will discuss a paper to be given on "The pathology of the frontal sinus: Present status of its diagnosis and treatment".

During the month of March, Dr. Albert E. Sloane participated in the Instructional Lectures given at the Postgraduate Course in Ophthalmology in Columbus, Ohio. Dr. Sloane also lectured on "Eye disorders in adolescence" at the Adolescent Unit of the Children's Medical Center in Boston.

Dr. David G. Cogan spoke on "Neurology of the ocular motor system" at the National Institutes of Health in Bethesda, Maryland, on March 5 - 15. At this same conference, Dr. Cogan and Dr. David D. Donaldson gave a course on "Neuro-ophthalmology and Neuro-anatomy".

Dr. David S. Johnson is living in Detroit, Michigan, after completing his residency in Ophthalmology in February.

A visitor to the Ophthalmology Service at the Infirmary is Dr. Paul O. Braendstrup, from Copenhagen, Denmark.

At a meeting of the Executive Committee of the Massachusetts Eye and Ear Infirmary, held February 16, the following appointment was made:

Dr. S. James Bullington — Assistant in Ophthalmology.

VOLUNTEER GROUPS

MGH STAFF WIVES HOSPITAL COMMITTEE

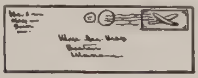
There will be a tea for our visitors from distant shores on April 23 in the Doctors' Dining Room, from 4:30 until 6 P.M. It is hoped that the staff physicians, also, will attend at that time for a pleasant interlude in their work.

Our Annual Meeting will be held on May 1, at 10 A.M., in Bartlett Hall. Coffee will be served first, and the meeting will begin at 10:30. It is hoped that we can adjourn promptly at noon. Try to come to this very important meeting. Many interesting subjects will be brought up.

On May 30, the Annual Picnic will be held at the Bradford Cannons' in Lincoln. Since the holiday falls in the middle of the week, the picnic will begin at 12 noon. Lunches should be brought, but ice cream and beverages will be provided. This is the day when the staff and their wives and children can meet our visitors from other lands and their wives and children, so all please come.

There is a wading pool for the little ones and pleasant walks in the woods for older ones. It should be delightful, and we hope to see you there.

Sign up for transportation at our Reception Desk if you need it.



New addresses:—

Dr. Joseph J. Barlow (r.p. 1955), c/o Dr. Alexander Kellie, Middlesex Hospital, London, England
Dr. Albert G. Engelbach (past a. dir.), National Foundation for Infantile Paralysis, 120 Broadway, New York 5, N. Y.
Dr. James J. Ferguson, Jr. (r.p. 1955), 4855 Westbourne Rd., Lyndhurst 24, Ohio
Dr. Falls B. Hershey (*E.S.* 1947), U.S. Veterans Hospital, 915 North Grand Ave., St. Louis, Mo.
Dr. William Nicholas Jones (a.r.s. *Or.* 1954), 35 Huntington St., New London, Conn.
Dr. Philip L. McCarthy (a. *D.*), 36 Adams St., Quincy, Mass.
Dr. Thomas C. Peebles (*C.M.* 1952), 100 Summer St., Weston, Mass.
Dr. William P. J. Peete (*S.* 1948), School of Medicine, Duke University, Durham, N. C.
Dr. Richard H. Sweet (*E.S.* 1928), 87 Chestnut St., Boston 8, Mass.
Dr. Earle W. Wilkins, Jr. (*W.S.* 1945), 87 Chestnut St., Boston 8, Mass.

In response to our persistent pleas, Dr. Faxon has at last given us this interesting and colorful account of the trip Mrs. Faxon and he made to Turkey some months ago:

In March 1955 I was asked by Mr. Luther R. Fowle, acting for the Directors and Managers of the American Hospital of Istanbul, to survey the hospital and make recommendations relating to future operation and development. The survey was to be financed by the Ford Foundation. Dr. Bernard T. Daniels, a Denver surgeon, was selected to evaluate the technical adequacy of Turkish surgery and medicine. Both of us were to be concerned with the operation of the hospital, the medical organization of the Turkish doctors, the nursing situation, the government Public Health program, and similar problems.

The American Hospital of Istanbul was started in 1920, to serve American naval personnel on temporary duty in Turkish waters and Americans in the area. It also has served the local population of Turks, Armenians, Greeks, Jews, and others, including many refugees. Locally, it is called the Admiral Bristol Hospital to commemorate a great American who, acting as High Commissioner to Turkey following World War I, caught the vision of a modern, democratic Turkish Republic rising from the ruins of the Ottoman Empire, and was instrumental in the establishment of this hospital. He was beloved of Turks and Americans alike. Surviving many vicissitudes, the hospital now occupies a modern building erected in 1939, accommodating 75 patients. Its School of Nursing and nursing personnel are housed in an attractive Nurses' Home which was completed in 1950. It has a small endowment fund administered by the Directors of the American Hospital of Istanbul, Inc. — a nonprofit corporation with offices at 40 Worth Street, New York City. A Board of Managers, composed of Americans resident in Istanbul and Turkish citizens, is responsible for the actual operation of the hospital. It is not a missionary hospital.

On May 18 our party — consisting of Dr. and Mrs. Daniels, their 14-year-old daughter Jean, Mr. Fowle (who was to act as guide and interpreter), Mrs. Faxon and I — took off from Logan Airport in a Pan American plane. Our flight across the Atlantic, including a brief stop at Gander, Newfoundland, was smooth and uneventful. The sunrise high above the Atlantic cloud belt was beautiful. We made a short stop at Shannon, Ireland, and another at Paris. Flying just west of the French Alps, we were treated to some splendid views of those rugged mountains. We continued along the Riviera, with Corsica and other islands in the distance, to Rome, where we broke our journey. We stayed in Rome for two days, visiting the usual places of interest.

A British European Airway plane took us to Istanbul Airport, where we arrived at about midnight—another comfortable flight. A bus ride of 12 miles over rather poor roads took us to Istanbul (which translated means "The Town"). We passed through the old city, with the minarets of the mosques gleaming with rows of electric lights around the balconies from which the muezzins call the faithful to prayer, and crossed the Ataturk Bridge to Beyoglu (old Pera) on the eastern side of the Golden Horn, to the new Istanbul-Hilton Hotel which had opened that morning.

On May 29 we moved to quarters in the Nurses' Home on the hospital grounds, which were pleasantly landscaped with flowers, cedars, pines, and deodars. While the men went to work going over the hospital, visiting Turkish hospitals, and talking with Turkish doctors and laymen, the ladies had a grand time exploring Istanbul streets and shops, including the famous Bazaar — a gloomy building housing about 2000 shops which display every kind of merchandise imaginable. On Saturdays and Sundays the men had their turn.

The Turkish hospital system is predominantly governmental, i.e., federal or municipal. There are a number of proprietary hospitals much like the British nursing homes or the small private hospitals that flourished in Boston round 1900. The government is developing a type of Workmen's Compensation hospitals, somewhat smaller than the other governmental units, where most of the accident and much other surgery is done. There is a German and a French hospital, both subsidized by their governments. The American Hospital is the only representative of the voluntary, nonprofit hospital corporation which is the backbone of our hospital system. It occupies a unique position, unhampered by the suspicion attached to the French and German hospitals by reason of their connection with their governments.

We visited many Turkish hospitals and, with one exception, found them to be 50 years behind those of the United States. Although the buildings were mostly fireproof, they were poorly planned and according to our standards poorly equipped. Utility rooms were practically nonexistent. The kitchens were substandard in every way. Little attention was paid to food service. It was simply so much nourishment, take it or leave it, but the Turks usually cleaned up their plates. Hot water was often at a premium and dishwashing was all hand work. Maintenance and housekeeping were poor. Their operating rooms were up to date, usually well equipped and well kept. Technically, surgery and medicine were nearly on a par with ours, but postoperative care was not too good. While there were a few rooms for private patients, most all were ward cases. People who can pay go to the proprietary hospitals. These are only fair —not bad but not good. The only hospitals I would dare to be sick in over there are the Admiral Bristol and the German Hospital.

The exception among the Turkish hospitals mentioned above was a university unit in a federal hospital, directed by the Professor of Medicine of the University of Istanbul Medical School. This was modern in construction and arrangement, up to date in operation, well equipped and admirably conducted, though on the German Herr Professor system. It was the one bright spot among the Turkish hospitals.

There are 2 universities in Turkey, both with medical schools — one in Istanbul and one in Ankara. They are state schools and have been strongly influenced by French and German medicine, but they are now beginning to recognize American medicine, also.

At last we come to the American Hospital. As stated before, it is a nonprofit institution, controlled by a Board of Managers composed mostly of Americans living in Istanbul but with some Turkish members. Dr. Lorrin A. Shepard, the only American doctor on the staff, has been Medical Director and Chief Surgeon for 29 years. He retires this year and it is necessary to find a successor for him. Under him is a strong, well-balanced team of specialists in medicine, surgery, obstetrics, pediatrics, anesthesia, radiology, biochemistry, bacteriology, and pharmacy. These are all Turkish doctors, some of whom have received training in the United States. There is an intern and resident staff of 6.

The Nursing Service has always been supervised by one or several American nurses who have also taught in the School of Nursing. The number of students ranges from 20 to 30 and, to date, there are 188 graduates. As there are only about 1000 active nurses in all Turkey, the importance of the school is apparent.

My impression of the hospital is that it approximates the general arrangement and operation of an American hospital of the same size. The admission of patients is not handled as carefully; the records are not as well kept; there is more informality in handling the patients in Dr. Shepard's and the other doctors' offices; the floor discipline of nurses is less strict, with some minor variations in practice; and the admission of visitors is more closely guarded. The surgical and medical care is excellent. The training of residents has been improved lately through the introduction of grand rounds and more personal instruction by the staff. After 3 years of training these residents are eligible for government board examinations and accreditation as specialists. Maintenance was fair. It is a Turkish weakness to build and then neglect upkeep. Consequently, buildings deteriorate rapidly and in a few years look twice their age. Part of this is due to difficulty in obtaining materials and money, but part of it is a national defect. Housekeeping was alternately good and poor, depending upon the quantity of help which fluctuated widely. This fluctuation was partly due to a general scarcity of labor and partly due to an inflationary wage situation which the hospital had not been able to meet. The kitchen was below par according to our standards. The coal range could be excused, as gas or electricity is unreliable and oil very expensive; but the wooden tables and cabinets, the dirty floor with burlap bags to wipe feet on, the unsatisfactory dishwashing facilities both in the kitchen and on the floors, and the lack of labor-saving equipment gave a very poor impression. Likewise, the distribution of food to patients was poorly handled, in spite of ward kitchens. Here is one department that should be brought up to standard. Food handling in Turkey is very casual. Dietitians are definitely indicated. There is a good x-ray department, a good laboratory, and pharmacy— all well run.

The nurses' dormitory provides a complete teaching unit with offices, classrooms, library, laboratory, and diet kitchen. There are bedrooms for 34 students and 16 graduates, and a suite with 4 bedrooms for supervisors. There is a large assembly hall for games and stage plays. Wide balconies provide a chance for fresh air and a wonderful view of the Bosphorus. Any hospital could be proud of this building.

The nursing situation in Turkey is serious. There are only about 1000 active nurses; there should be 30,000. The attitude of the recently emancipated women of Turkey toward nursing is much the same as existed in the United States in 1875. It is considered as a menial job, but according to the Chief Nurse of the Turkish Red Crescent (which is the same as our Red Cross) this attitude is changing and respect for nursing is increasing. An affiliation with the American Girls College is being planned, which should provide students competent to become teachers and superintendents, thus increasing the prestige of the School of Nursing.

Our 4-weeks' visit ended, we flew to Athens for a 2-day stop-over. We stopped again for 2 days in Rome, and then started on a bus trip to Florence, Venice, and Milan. From Milan we flew over the Alps, close to Mont Blanc, stopped for a moment at Geneva, and then went on to Paris. During our few days there I visited the American Hospital in Paris which I surveyed in 1950. We then continued on to London, and after a few days there took off for home via Pan American. I just can't get used to the marvel of air travel. At 3 P.M. on a Thursday we were on a bus going to Hampton Court, about 15 miles from London; at 3 P.M. the next day we were on our train bound for West Falmouth.

Why should there be an American Hospital in Turkey? There are several reasons. The most obvious is that it will provide a satisfying hospital for American residents in Turkey. A more important reason is the provision of an example of the American way of hospital operation, the doctor-patient relationship, the staff organization, and our methods of diagnosis, treatment, postoperative care, and, lastly, as an example of our private nonprofit hospital corporation which has played such an important role in the development of our hospital system. Such organizations are almost unknown in Turkey. Almost everything stems from the government over there. If Turkey is to become a real democracy it must encourage private initiative — both individual and collective, and a successful demonstration of a nonprofit hospital is one means of showing them that hospitals do not have to be government institutions.

On the way to Turkey I found myself wondering whether there *was* any need for the continuation of the American Hospital. At the end of my stay I was convinced that there was, and that there exists a wonderful opportunity for us to help in developing a better hospital system in Turkey; also, that we might, by example, help in building a medical organization — since practically none exists now — which could play an important role in guiding Turkish medicine.

It was a wonderful trip, from which I returned enthusiastic about the American Hospital and its work. As I said before, Dr. Lorrin A. Shepard, the present Director, will retire this year after 30 years of service. The position of Director affords the opportunity for a man to develop an extensive surgical practice, to exert a beneficial influence on medical affairs in the growing Turkish Republic, and, at the end of service, to retire with the satisfaction that he has helped to make this a better world. Financially, he will probably not be as well off as he would have been had he stayed in the United States, but from the standpoint of accomplishing worthwhile objectives in life, he will be far ahead. He must be a well-trained surgeon, interested in leading and teaching his staff. He must have high ideals and a touch of the missionary spirit, although the American Hospital has no connection with any missionary organization. The position offers a real challenge and one which will give lasting satisfaction if successfully met.

Brief bits:—

Dr. Edward B. Benedict attended the February 16 meeting of the Boston City Hospital House Officers' Association and discussed a paper on laparoscopy (peritoneoscopy) by Dr. Jacques Caroli, Gastroenterologist at the Hôpital St. Antoine, Paris.

On February 18, at Williams College, Dr. Chester M. Jones received the Rogerson Cup and Medal, presented to him by President J. Phinney Baxter, III, at an Alumni Meeting. Dr. Jones graduated from Williams College in 1913, and was awarded an honorary degree of science from the same institution in 1942. The Rogerson Cup and Medal are awarded by the College each year to an outstanding alumnus for service and loyalty to the College and for distinction in any field of endeavor.

Dr. Robert R. Linton recently visited Dr. Eric Cruikshank, Professor of Medicine at the new University of the British West Indies Medical School. Dr. Cruikshank, formerly of Aberdeen, Scotland, spent 1938-39 working with Dr. Champ Lyons at the Massachusetts General Hospital. He later joined the British Armed Forces, was taken prisoner at Singapore by the Japanese, and remained there throughout the rest of the war. Starting from scratch, he and others have done an excellent job in the last five years in establishing this new University Medical School. Syphilis is still a very common disease in Jamaica, and there is also much general interest in the new methods of treating aneurysms; so Dr. Linton gave a talk to the hospital staff and the doctors in the vicinity of Kingston on modern surgical methods of the treatment of major arterial lesions. On February 2, Dr. Linton took part in the Cardiovascular Symposium in Albany, N. Y., at the Albany Hospital, speaking on "The surgical treatment of obliterative arterial disease".

At the Atlanta Graduate Medical Assembly, held in Atlanta, Georgia, last February, and attended by over 800 doctors from the State, Dr. George Saslow gave 2 papers on "A practical approach to comprehensive medicine". On one panel, with 4 psychiatrists from Georgia, tape-recorded questions submitted by Georgia's doctors were answered by the panel. The questions were concerned chiefly with: 1. When do you refer a patient to a psychiatrist? 2. What are effective referral procedures? 3. What can a referring doctor expect from the psychiatrist in the way of communication?

Dr. Richard C. Webster and Dr. Richard J. Coffey are scheduled to present a paper entitled "The posterior pharangeal wall flap in rehabilitation of complicated palate cases" at the 14th Annual Meeting of the American Association for Cleft Palate Rehabilitation, to be held in Kansas City, Missouri, on May 4.

Dr. and Mrs. Claude E. Welch recently were guests of the Los Angeles Surgical Society. Dr. Welch gave an address on "Some unusual manifestations of intestinal obstruction", at the President's dinner meeting on January 19, and followed it with several presentations at the meeting of the Southern California Chapter of the American College of Surgeons in San Diego. At the same time, Dr. William H. Snyder (*W.S.* 1933) was awarded a special medal by the Los Angeles Surgical Society for special work in children's surgery. This is the third time this medal has been awarded in 40 years. Other MGH men who were present and found to be flourishing were David Sheldon, who is now an instructor in the University of Southern California Medical School, and John Kennedy, who has acquired a great interest in vascular surgery and who is practising in San Diego.

Dr. Weldon W. West (*S.* 1948), our "singleton" in Stockton, California, has sent us this interesting letter:

I have been in Stockton for approximately 13 months. I arrived here after having canvassed most of the areas in northern California in search for a place for a general surgeon. This town would seem to be the most suitable. Incidentally, it is my own home town and I am delighted to be back. My decision was not the only one being made during this time, apparently, because 4 other new young general surgeons of good training came to the community at the same time. Business has been slow, as you might well imagine, and I have been having considerable difficulty learning the economic facts of life. For the first 6 months I tried on my own to establish a surgical practice, without great success. I thereupon joined an office of 3 other surgeons and gained considerable respite, money-wise, but also had considerable distress professionally. Therefore, the first of October 1955 I again embarked on solo surgical practice.

I have found the medical community to be most congenial, with many well-trained men in the fields of general practice, internal medicine, cardiology, neurosurgery, orthopedics, and general surgery. My special interest is vascular surgery, and during this past year I have finally been able to organize and establish what we call "The Delta Artery Bank" in conjunction with the local blood bank. This bank is just now beginning to function, and we have arranged to have vessels obtained in this area processed by the Freeze-Dry method in San Francisco and returned here. It has been of great interest to me to find that there is a definite need in this community for human homografts. In conjunction with this, I have been fortunate to be appointed to the staff of the local County Hospital and permitted to establish a vascular service and vascular clinic there. I hope to establish soon a similar service at the State Mental Hospital in Stockton, which has a population of about 5,000 inpatients.

Fortunately, we are near San Francisco and I am able to see many of our mutual friends there on frequent occasions. Dr. John Erskin and Dr. Leonard Rosenman are on the committee with me for the Northern California Artery Bank. I occasionally see Dr. Benson Rowe doing chest surgery at the University of California. Dr. Dexter Richards is in Berkeley, doing a thriving general surgical practice.

Other personal notes are: the passing of the American Board of Surgery last spring, current application for the American College of Surgeons, organization of the Stockton Surgical Society, and the enjoyment of the College of the Pacific football games.

P.S. We could use one or more good nose and throat men in this area if any of the boys are interested.

We were so *very* glad to receive this letter from Dr. Chiu-an Wang (*W.S.* 1944), together with a most interesting and informative booklet containing 120 large pages of fascinating pictures of Hong Kong and its many activities and industries. The booklet may be seen in the office of The News. It would be well worth your while to come in and look at it. When we opened it we expected to spend a few minutes with it, but found when we put it down that an hour of complete absorption had elapsed. Dr. Wang's letter reads:

I received your letter in which you ask me to write for The News as the "singleton" MGH-ite of Hong Kong.

Just to give you and my friends at M.G.H. some idea about Hong Kong I am sending you a little booklet called *This is Hong Kong.* It is actually Hong Kong in pictures. You may keep it for reference or leave it at Treadwell Library for those interested in Hong Kong.

We have been here since 1950, and have enjoyed living and working here. It is a lovely place. Just how long it can remain as it is nobody knows, not even the British.

My wife and I often talk about the M.G.H. and our friends there. You probably know that she was in Boston last April, visiting the M.G.H. and her alma mater, Wellesley. She has told me a good deal about the expansion of our great institution. I hope to visit all of you again in the near future.

We have four girls now. The two older ones are in the primary school, learning rather well the art of Chinese brushing and the Chinese way of life. The two little ones are as yet too small to enter the kindergarten. We live in the mid-level on the Island side, overlooking the beautiful harbor. With many new housing projects either going on or near completion, living quarters are not as scarce as they once were. Cost of living is not high. One can get an Arrow shirt for less than US$3.00, eat a good steak dinner for less than US$1.25, or have a haircut for US$.75. The reason is that we do not have many kinds of taxes as you do.

Professionally speaking, the doctors have much more work than they can handle. For a population of over two millions, we have a little over four hundred doctors. These are all western trained. The majority are local graduates of the Hong Kong University. A few, like me, are imported, so to speak. Clinical materials are voluminous. Diseases, in many ways, are much the same in nature as those in the States. Exceptions: we have practically no postoperative phlebothrombosis or embolism, yet we have many more cases of carcinoma of the liver and contagious diseases such as tuberculosis, and childhood diseases such as measles, chickenpox, mumps, etc. We have few cases of poliomyelitis, the majority of them being Europeans and Americans. The Chinese seem to have immunity against it.

Please convey my best wishes to all our MGH friends.

This exciting letter from Dr. Isaac M. Taylor (*M.* 1946) to Dr. Means — who has thoughtfully passed it on to us so that Dr. Taylor's many friends may enjoy it — comes from a part of the world never before represented in The News. The letter was written on December 29, from Hut Point, Cape Armitage, Scott Island, McMurdo Sound, Antarctica, with "Operation Deep Freeze, Task Force 43" added on the back of the envelope. Dr. Taylor

Probably the last picture to be taken of the old EEG Laboratory in action. Mrs. Sylvia Walker, R.N., who will retire this spring, is with the patient. Mrs. Frances Potts is at the 15-channel French machine.

is a Commander in the Navy's Medical Corps, and is Medical Officer to Admiral Byrd's Operation Deep Freeze. The letter reads:

Your Christmas card and your letter reached me today. How delightful to hear from you. Our last mail leaves New Zealand on 15 January, so you won't have the opportunity to answer this until next September, but I shall hope to hear from you then.

I can't begin to tell you what a marvelous and exciting time I'm having. The trip is turning out to be as good as I could possibly have hoped for — better, even. We had a delightful three days in New Zealand and then an eight-day passage to the ice. We've been here at Hut Point for ten days in an advance camp, and now the camp ships are being escorted in by the icebreakers to a point close enough to unload material and supplies for flying and for our winter base.

Hut Point is the site of Captain Robert F. Scott's winter camp for two years in the 1901-1903 expedition. You will find good descriptions of it in Scott's *The voyage of the discovery*. The older editions have good photographs of the area. I don't think Scott gives an adequate picture of the natural beauty of this place, and I'm sure I can't. We are on the west side of Ross Island, looking south and west across McMurdo Sound at the mountains of the mainland 30 miles away. These are gorgeous and dramatic peaks, rising to 15,000 feet, covered with snow. The Sound between is still frozen hard with the winter's ice. Our weather has been good except for two days of blizzard, and, of course, the sun is up twenty-four hours each day. Unusual beauty accompanies the illumination of the land from each of the 360° of the sun's course. The air temperature does not get above freezing, but the snow is melting under the constant sun. Behind the camp are low basalt hills which make excellent hiking areas for one like me — unaccustomed to walking.

Captain Scott's cabin still stands in good condition after 54 years. It is filled with snow and ice, and we hope to excavate it and restore it as a memorial. On one hill near by stands the memorial cross to Scott, erected in 1913 after his body was found, and on another a cross to Seaman Vince, who died in Scott's first year here in 1902. Shackleton spent the winter here in 1908, and I don't believe many people have been ashore since. The reminders of the English are everywhere about us.

Every day is a new adventure, and I live in constant anticipation or excitement or appreciation of nature. I suppose things will be duller through the winter night, but even then there will be absorbing things to see and learn and do. Medically, we are operating at a very primitive level in this base camp, but the ships are available for any serious problems and I will be well equipped when the winter base is built.

We are very grateful to Dr. Butler for passing on to us this delightful letter from Dr. Boris Senior (*C.M.* 1950), written from South Africa:

I don't know whether your many far-flung ex-trainees regularly say hello. If so, you must be inundated with letters and that must be yet one more of the multiple tasks of a service chief. Well, even if it is a task and a duty to you, it remains a pleasure to us. A happy experience becomes rose-tinted with time, and yet more time has only served to add a richer glow. This florid phraseology is indicative of the warmth that envelops one on consideration of the M.G.H.

The tranquil South African medical scene was recently shaken by an epoch-making occurrence — namely, my entry into private practice. Unfortunately, the shudder was not violent enough to reach the public, and at a patient a week my conversion rate can hardly match that of Billy Graham.

Am in practice in Johannesburg with two senior men and Lennie Braudo (a.r.p. *C.M.* 1953). Am actually enjoying the clinical side very much, as I have always preferred palpating a spleen to a test tube. The material is excellent. Apart from the over-all run, there are two adrenogenitals, two Turner's, two panhypopits (reads like Noah's Ark to here), and a hypoparathyroid.

The past year saw me settled in a home and the father of a little boy who is well up to Gesell and heavy on the calories.

Possibly this letter gives the impression that I am well and truly settled here like a barnacle to a keel, and with only an explosion able to dislodge me. Nothing could be farther from fact. The weekly routine is to check with the U.S. Consulate regarding visas, try to work out just how few dollars one needs for hamburgers and covering, and ascertain whether anyone would be willing to employ one, anyway. The latest news is that I can slide in as an immigrant attached to my wife's apron strings. She, apparently, is highly eligible for a visa. I know that the rule is something like that of heavyweight champs — "they never come back" — but lightweight pediatricians do!

THE NEWS

No. 156 Boston, Mass. May 1956

McLEAN HOSPITAL

Dr. W. Franklin Wood, Director of McLean Hospital since 1932, began a leave of absence on March 1 which will lead to his retirement later in the spring. The end of twenty-four years of devoted service by Dr. Wood signalizes a turning point in the general program at McLean Hospital. Dr. Wood has been replaced by Dr. Alfred H. Stanton, who has been at McLean for the past four months as Psychiatrist in Chief. The new program was planned to complement the appointment of Dr. Lindemann as Chief of the Psychiatry Service of the Massachusetts General Hospital. Dr. Stanton has a past experience which closely parallels that of Dr. Lindemann in his special interest in social psychiatry, but is complementary to it in his focus upon the psychiatric hospital.

The change in administration at McLean comes at a time of active critical study of current psychiatric hospital practice throughout the United States and Western Europe. Although the new tranquilizing drugs and other physiological therapies have contributed to making the psychiatric hospital of today a very different place from that of a decade ago, the main development has derived from the better understanding of the implications of psychotherapy and group techniques. A modern mental hospital is a lively place indeed, with its many group meetings of all sorts — some straightforward group psychotherapy, some committee meetings of patients, frequent staff meetings, and group teaching methods — and an active program of individual psychotherapy, in addition to the more usual hospital activities of physiological treatment and general nursing care. In such a general atmosphere, many previously accepted practices have come to be widely questioned or replaced by other practices at both the administrative and the group level which had been thought to be unrelated to the matter of mental health or illness. The world of the modern psychiatric hospital is consequently an exciting and interesting one indeed.

While even psychotherapy is not yet included in many current textbooks on therapeutics, the modern psychiatrist not only uses psychotherapy but has added still another new area of therapeutic activity in the use of ward group functions as part of treatment and in the careful recognition of the clinical importance of the patient's position in the ward group or in the family group.

In a number of respects the psychiatric hospital has recently become more like the general medical and surgical hospital; in others it has become different. The idea of a long-term treatment hospital in which patients were put away because they were "insane" and "couldn't take care of themselves" has been replaced in modern medical centers for a considerable period of time; like other stereotypes, this image of the psychiatric hospital tends to persist in spite of changed practices. It is true, of course, that general custody and skilled nursing care for elderly patients is an important feature in many of the best general psychiatric hospitals, and that this function is likely to become more important as the average age of the general population rises. But such gerontological wards are very different indeed from the usual picture of a place where patients are "put away". With very few patients in bed, even among the very aged, and with a bright and active atmosphere, such wards can clearly be places where patients go on living.

The wards for elderly patients are only one part of the hospital where nursing and medical care make increasingly skilled use of the group of patients as a primary part of the hospital program. Such group experiences may be even more important, playing a crucial role in the actual clinical course of the patients. It is usual, for instance, for a new patient just admitted to a psychiatric hospital to show a rapid change in his clinical condition immediately after admission. Often this is simply a matter of the continuation of the changes which had led to his being brought to the hospital. Often, however, it seems to be actually related to the patient's way of dealing with the double problem of adaptation to a new and strange setting on the one hand, and on the other to his separation from an old and familiar, and usually troublesome, environment which his family or his ordinary place of living comprise.

A few years ago, before the importance of this acculturation period for the patient was recognized, this rapid clinical change was very likely to be for the worse. Patients immediately after coming to the hospital would fairly frequently become considerably more disturbed than at the time of admission. Even though this was usually temporary, it comprised a serious problem. It is now becoming more frequent that the patient shows a striking, rapid, and substantial improvement upon admission to the psychiatric hospital—often an improvement which the same psychiatrist treating the patient in the community was unable to bring about. The adaptation period of patients to the new hospital situation has, as a result of study in a number of places, been turned into an asset rather than a liability.

Improvement in admission techniques has been carried to such an extent in Amsterdam, that the psychiatry personnel are called on an emergency basis to the scene of an acute disturbance anywhere in the city, rather like an ambulance being called to an automobile accident. A violently disturbed family situation is often met by a team of psychiatrist, nurse, and social worker within half an hour of the time of its breaking out. Such a team is often able to obviate hospitalization altogether. If hospitalization does occur it is carried out much more easily, more skillfully, without the deception of the patient, and in a way which augurs well for the patient's later treatment, rehabilitation, and return to the general community. The modern psychiatric hospital, in contrast to usual practice before World War II, meets its new patients with a complete examination, carries out systematic studies, and arrives promptly at a diagnosis of what is the matter with the patient; this means, in psychiatry, not only a name for a disease but it also includes those factors in the patient's interpersonal situation which helped in precipitating or continuing it. A treatment program is prescribed on the basis of this general diagnosis. These aspects of the modern psychiatric hospital have developed by trying to approximate the care of patients given in general hospitals where a rapid work-up of the patient is done in a quite analogous manner. The expectation of an early discharge is also increasingly characteristic of the psychiatric hospital, although arrangements for continuing treatment of the patient after his return to the community have not been worked out to match the ability of the hospital personnel in sending the patient back into the community. Psychiatry services in general hospitals, in which the Massachusetts General Hospital was a pioneer, may help greatly in solving this problem.

The purely psychiatric hospital, however, has other problems and techniques which differentiate it from the general hospital. The psychiatrist picked up many of these techniques from psychotherapy and from the study of general and social psychology more than from his affiliation with the rest of medicine. If a patient does not improve in many hospitals within a month or two, active treatment is generally abandoned or the interest in the patient goes to a low level and "ancillary" treatments like occupational therapy, physiotherapy, and several others tend to replace it in the hospital's program for the patient. Recent developments in psychiatric hospital practice, however, have tended to bring new sidelights to this. The timetable of psychiatric hospitals (for those patients who do not improve and return to the community rather quickly) is considerably longer than that which is usual for doctors and nurses. In the mental hospital a patient is not thought of as a "chronic" patient for a year or two or even longer. Active treatment is planned, carried out, and worked through by psychiatrists and the whole group of personnel who compose the modern psychiatric hospital, on a month-to-month basis rather than on an hour-to-hour basis. While this relatively longer time scale may serve as a euphemism for no treatment at all ("continued treatment" was one of these euphemistic phrases), treatment which takes a full year may be worked out carefully, systematically, in the psychiatric staff conference according to the nature of the patient's disorder. However, this time scale and rate at which change occurs is rather more like that of a school than like that of a general hospital, and consequently the modern psychiatric hospital resembles a boarding school in some respects more than it does the general hospital. This longer time scale has brought with it not only problems but also special insight. Outstandingly it has been increasingly recognized in psychiatric hospitals that the activity of the patient is the most important thing which the hospital can facilitate in bringing about recovery. The modern psychiatric hospital has left far behind the idea that patients should be in bed. Patients in a psychiatric hospital are, of course, rarely kept in bed; they are up and around and are often engaged in strenuous physical activity. But patients not only engage in physical activity; they also take part in serious, long-term, and relatively effective mental activity. Educational programs are a regular part of the modern psychiatric hospital. Patients may live in the hospital and go out to work every day, returning to the psychiatric hospital for treatment in the evening.

An instructive example was presented by a recent problem which arose at McLean Hospital. Following this general policy, the patients at McLean have organized two associations, one of which is devoted to planning and arranging for their own recreation. The other provides a vehicle for the patients to express their views and perhaps to take part in the management of the ward or in contributing to the working and planning for the hospital. This latter patient group has organized a hospitality committee whose purpose will be, following procedure used in certain other hospitals, to greet and welcome visiting psychiatrists and nurses, new patients, and, interestingly, new affiliate nurses. This partly worked out plan calls for the patients to appoint a small group of their own number to meet the new affiliate student nurses who come to the McLean Hospital and who always show signs of a certain amount of unfamiliarity and uneasiness. This group of patients will orient the students to the hospital and, to some extent, to the nature of psychiatric nursing care. Primarily, it was designed by the patients explicitly, to put the affiliate nurses at their ease. The staff expressed apprehension over only one aspect of this plan. The past record of success of the patients' groups is such that there is little concern about whether or not this group will succeed. The main concern was that the young student nurse, accustomed to patients who are essentially in the position of being taken care of, might find it unsettling to be put in the position herself of being taken care of by a group of patients. That it might be somewhat disturbing to the affiliate nurses was clear, but that it would be more instructive than disturbing was even clearer, and consequently there were really no serious apprehensions about how this plan of the patients will work out.

This new point of view by no means implies that patients in the hospital are not ill or that they do not need some sort of nursing. But the nature of much psychiatric illness has apparently been poorly identified. It is now clear that the type of nursing which has been taught in the past is only a part of the type of nursing which is needed. Nurses with group and organizing skills, nurses able to identify isolated areas of personality defect and to support patients in these areas while allowing them to go ahead in other areas — these are the psychiatric nursing skills needed particularly.

The recognition that this type of patient care was needed developed primarily from experience in psychotherapy. In individual psychotherapy, the patient and the doctor both work hard at trying to understand the nature of the patient's personality disorder and his particular handicaps in his personal relations. The fact that the doctor is very active indeed does not mean that the patient does not work hard also. Being a patient in a mental hospital is similar. This development of organized activity for patients gives a new dimension to conventional occupational therapy, recreational therapy, physical therapy, and so forth. Therapists work with patients as part of a whole plan in which the activity of the patient is both encouraged and assumed; patient initiative is not regarded as rebellious, but is taken as a matter of course.

The psychiatric hospital consequently offers an excellent opportunity to study the relation between group performance and individual disorder. Study of this sort can be expected to contribute not only to an understanding of its own effects but also to an understanding of the general hospital. The patient who stays in a hospital for a week or two usually has no serious interpersonal problem created by the fact of his being in the hospital. True, he misses time at the office, he loses a certain amount of money, and misses appointments. He may become restless because he wants to be doing more, or he may be gratified at the chance to do some reading which he has had to postpone. If, however, the patient must remain in the hospital for eight to ten weeks, his problem becomes quite different. Now loneliness and homesickness become important. The people in his immediate environment— the nurse, the other patients (if they are accessible to him), his doctor, and the occasional visitors — assume a very great and rather unusual importance. Childlike dependence upon them may appear in patients who had no such problem before. Many patients suffer from the fact that they are in bed and that all initiative, thought, planning, and the things that make life worth while are transferred to the hands of others. The ability to work out ways of ameliorating this situation or even of turning it to advantage has developed in psychiatric hospitals and is applicable in general hospitals. Thus, wards may be considerably better places for long-term patients than private rooms if the private rooms keep patients isolated from each other. Patients in general hospitals also form informal groups with no awareness of their importance, unless the groups are formed surreptitiously. In any case, the usual structure of the general hospital is such that the patient is seen as a single being and the physician is unlikely to know of the existence of such groups of patients. Since all the patients in such wards are likely to affect each other, to get uneasy or comfortable at the same time, it is not unusual that a perceptive nurse knows exactly why a particular patient is "worse" when the physician has no clue; she knows that all the other patients are "worse", also, and is likely to know something about why. Often the high morale — or the partial demoralization —of a particular ward is the effect of easily correctible oversights or of staff conflict which is unrecognized, or other similar, personal factors. It may occasionally be a quite easy matter to effect a simultaneous improvement in many patients — if the importance of the usually unrecognized group is appreciated.

The new program at the McLean Hospital will undertake both to exploit these new understandings of hospital treatment and to investigate them. The first measure taken has been to arrange for the addition to the staff of more psychiatrists. The addition of several residents will permit much more rapid and detailed study of each individual patient and will considerably increase the availability of systematic psychotherapy. At the same time, the residents will free the regular staff to become more familiar with the patient's family setting and his interpersonal relations in the hospital — information needed for the planning of his whole therapeutic program. The greater amount of free time should permit the nurses and the doctors on the wards to coordinate their efforts so closely that managing a ward becomes a program with clear clinical implications for each patient staying on it.

The education of the residents will require experienced supervisors in psychotherapy; some of these will be drawn from the general psychiatry community and others will work at the hospital. Supervision of psychotherapy—the planned and regular meeting of a resident psychiatrist with a senior psychiatrist to discuss in microscopic detail the contents of psychotherapeutic interviews—is a relatively new technique developed widely in psychiatric hospitals since World War II. It was first developed in psychoanalytic training institutes and has been adapted quite successfully to hospital practice.

Two new people have come to McLean to begin to put this program into effect. Dr. Merton Kahne, an experienced psychiatrist, has joined the staff on a full-time appointment. Dr. Kahne will bring to the hospital a considerable teaching experience, a special interest in psychotherapy and in psychiatric hospital practice, and valuable experience in group psychotherapy.

Miss Golda Edinburg comes to the hospital as its first social worker in psychiatry in some years. She is thoroughly experienced in psychiatric hospitals, having worked at the Veterans Administration Hospital in Medford, the Beth Israel Hospital, and the Chelsea Naval Hospital. McLean offers many natural advantages for studying the problems involved in discharge of patients as well as upon admission, and Miss Edinburg's experience will permit the hospital to give much more help to patients in especially critical areas.

This is a particularly interesting time for the new program at McLean. It is now generally recognized that group and institutional factors are of great importance in determining the clinical course of the patients, but little more than this is known exactly. Much of what is known is known only intuitively, vaguely, or in a general way. Just what their importance may prove to be and how these aspects of treatment can be used best are matters which will not be known until a good deal more is found out about them. But the methods necessary for research are available from the psychological and social sciences, and this field of research will be exploited at McLean along with its current program of biochemical research.

Alfred H. Stanton, M.D.,
Psychiatrist in Chief

We think that all members of the Hospital family — both professional and nonprofessional — should know of the liberal discounts that are available on purchases of many items, by simply procuring discount cards from our Personnel Department. Reductions of from 20 to 50 percent are allowed to holders of these discount cards, by a selected list of dealers, on such articles as the following:

air conditioners
automobile accessories
batteries
bedspreads
bicycles
billfolders
blankets
blenders
blouses
brushes
cameras
can openers
children's apparel
chimes
clippers
clocks
copperware
curtains
cutlery
dishes
dishwashing machines
disposal units
draperies
electric appliances
electric ranges
electric razors
fans
fire extinguishers
fountain pens
freezers
fryers
fur coats
furniture
furniture covers
gas ranges
hair dryers
hampers
hardware
heaters
hosiery
irons
jackets
jewelry
kettles
kitchen cabinets
knives
lamps
lingerie
luggage
mirrors
mixers
mops
motors
paint
pajamas
phonograph records
phonographs
photography equipment
pillows
power mowers
power tools
pressure cookers
pyrex dishes
radios
refrigerators
rifles
rugs
scissors
shears
sheets
shirts
sinks
skates
slippers
socks
sporting goods
stoves
sun lamps
tablecloths
tape recorders
toasters
tinware
tires
tools
toys
trousers
typewriters
umbrellas
vacuum cleaners
wallpaper
washing machines
watches
water heaters
weather stripping
wheelbarrows
wire

An additional bit of advice: It would be to your advantage to secure from the Personnel Department the name of the dealer who gives the most liberal discount on any particular item before you make your purchase.

New addresses:—

Dr. David W. Compton (r.p. *An.* 1946), 2740 61st Ave., S.E., Mercer Island, Wash.
Dr. Richard H. Eppright (a.r.s. *Or.* 1955), 4520 Rossmoyne St., Houston, Tex.
Dr. Jesse T. Nicholson (r.s. *Or.* 1933), 1740 Bainbridge St., Philadelphia 46, Pa.
Dr. Kurt H. Thoma (hon. s.), 1146 Beacon St., Brookline, Mass.

The Board of Trustees, at their meetings during March, voted:

To accept with regret the resignation of Dr. Bernard D. Briggs from the position of Associate Anesthetist.

To appoint:

Dr. Carl A. L. Binger to the Board of Consultation, effective July 1;
Dr. Jack R. Dreyfuss as Assistant Radiologist;
Dr. Edward Hamlin, Jr. to the Social Service Advisory Committee, to succeed Dr. Oliver Cope;
Dr. William E. Karnes as Clinical Fellow in Neurology, acting as Assistant Resident on the Service, for one year, beginning July 1;
Dr. Ruth Murphy as Clinical Fellow in Psychiatry at McLean Hospital, beginning March 15;
Dr. Allan C. Oglesby as Exchange Assistant Resident on the Children's Medical Service, for the period April 1 through May 31;
Mr. Norman Roberts as Visiting Orthopedic Surgeon pro tempore;
Dr. Max L. Rosenheim as Visiting Physician pro tempore, for the period April 3 through April 15;
Dr. Morton N. Swartz as Assistant in Medicine;
Dr. Gerald G. Woodruff, Jr. as Exchange Assistant Resident on the Children's Medical Service, for the period April 1 through May 31.

The Trustees also voted to appoint the following Interns for one year, beginning July 1:

Medicine

Dr. Arthur F. Amick
Dr. Paul H. Black
Dr. Norman K. Brown
Dr. Leon I. Goldberg
Dr. Edgar Haber
Dr. John W. Josse
Dr. Arnold M. Katz
Dr. Herbert E. Kaufman
Dr. William M. O'Brien
Dr. Robert K. Osborne
Dr. James A. Rose
Dr. John D. Turner
Dr. Arnold N. Weinberg

Pathology

Dr. Richard T. N. Hunt
Dr. Sanford I. Roth

Surgery

Dr. Bob Bullwinkel
Dr. Louis H. Edmunds, Jr.
Dr. Jack J. Greenberg
Dr. John W. Grover
Dr. Dale G. Johnson
Dr. Donald M. McKee
Dr. Alfred E. Miller
Dr. Anthony P. Monaco

Children's Medicine

Dr. John P. Connelly
Dr. Nathan H. Fearer
Dr. Nathan T. Griscom
Dr. Gerhard Nellhaus
Dr. Renee B. O'Sullivan
Dr. Philip J. Porter
Dr. Margaret A. Single (Jan. 1, 1957)

Dentistry

Dr. Irwin I. Ship
Dr. John B. Taylor

At their meetings on January 18, during March, and on April 4, the General Executive Committee voted:

To reappoint:

Dr. Robert S. Adams as Clinical Fellow in Psychiatry, beginning July 1;
Dr. Munir H. Shamma'a as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Leonard Weiner as Clinical Fellow in Psychiatry for one year, beginning July 1.

To appoint:

Dr. Miriam W. Carmichael as Clinical Fellow in Neuropathology for one year, beginning July 1;
Dr. George Chalpin as Clinical Fellow in Psychiatry for one year, beginning July 1:
Dr. Beverly W. Cobbs, Jr. as Clinical Fellow in Medicine, beginning July 1;
Furio D'Abramo, Ph.D. as Research Fellow in Biochemistry, for the period September 1, 1956 through April 30, 1957;
Dr. Conway J. Don as Clinical Fellow in Radiology for one year, beginning on or about October 1;
Anna Maria Galdo, Ph.D. as Research Fellow in Psychology for one year, beginning March 1;
Dr. Jorge L. Litvak as Clinical and Research Fellow in Medicine, beginning March 1;
Dr. Herman L. Matern as Graduate Student Assistant in Orthopedics, for the month of March;
Dr. Maxwell G. Potter as Clinical Assistant in Psychiatry, beginning April 15;
Dr. Murray Rabinowitz as Research Fellow in Biochemistry, beginning September 1;

Dr. Alfredo A. Ramirez (de Arellano) as Clinical Fellow in Medicine, beginning July 1;
Dr. Claude E. Raynaud as Clinical and Research Fellow on the Children's Medical Service, beginning January 1;
Mr. Harold H. Rothstein as Research Fellow in Orthopedics, for the period February 10 through June 30;
Dr. Simon Thiry as Clinical and Research Fellow in Neurosurgery, for the period September 1, 1956 through July 15, 1957;
Dr. Henry deF. Webster as Clinical Fellow in Neuropathology for one year, beginning October 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you fail to include it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

General Medicine

Benedict, E. B., and Atkins, L.
Gastritis: Its differential diagnosis and treatment.
In M. Clin. North America, vol. 40, no. 2, Philadelphia, W. B. Saunders Company, pp. 343-352.

General Surgery

Bartlett, M. K., and Quinby, W. C., Jr.
Surgery of the biliary tract. I. Mortality and complications of cholecystectomy and choledochostomy for chronic cholecystitis.
New England J. Med. 254:154-156.

Bartlett, M. K., Quinby, W. C., Jr., and Donaldson, G. A.
Surgery of the biliary tract. II. Treatment of acute cholecystitis.
New England J. Med. 254:200-205.

Scannell, J. G., Brewster, W. R., Jr., and Bland, E. F.
Successful removal of a myxoma from the left atrium.
New England J. Med. 254:601-604.

Sweet, R. H.
The esophagus.
In Christopher's textbook of Surgery, Lloyd Davis, M.D., Editor, Philadelphia, W. B. Saunders Company, 6th edition, pp. 577-589.

Sweet, R. H.
Surgical treatment of achalasia of the esophagus.
New England J. Med. 254:87-95.

Laboratory Research

Barlow, J. S., and Brown, R. M.
An analog correlator system for brain potentials — Technical report 300.
Research Laboratory of Electronics, Massachusetts Institute of Technology, Cambridge, Massachusetts.

Neurology, Neurosurgery, and Psychiatry

Matarazzo, J. D.
The role of the psychologist in medical education and practice: A challenge posed by comprehensive medicine.
Human Organization 14, no. 2:9-14.

Matarazzo, R. G., and Matarazzo, J. D.
Anxiety level and pursuitmeter performance.
J. Consult. Psychol. 20:70.

Saslow, G., Goodrich, D. W., and Stein, M.
Study of therapist behavior in diagnostic interviews by means of the interaction chronograph.
J. Clin. Psychol. 12:133-139.

Ophthalmology

Johnson, C. C.
Operations for epicanthus and blepharophimosis: An evaluation and a method for shortening the medial canthal ligament.
Am. J. Ophth. 41:71-79.

Orthopedic Surgery

Aufranc, O. E.

MASSACHUSETTS EYE & EAR INFIRMARY

THE OLD AND THE NEW LUCIEN HOWE LIBRARY

The new quarters of the Lucien Howe Library are very attractive indeed. The basic color for the area is light brown with complementary shades of coral, green, and yellow. A sand-colored rug covers the floor of the main reading section. The tables and chairs for reading are of teak and oak, and the easy-chairs are leather covered. The walls and windows are hung with natural-toned linen draperies. The bookstacks are of steel construction. Behind the stack area are individual study carrels. A separate room houses the Ear, Nose, and Throat collection. There is an office-workroom for the librarian, and a small room for conferences and meetings. A total of 25 readers and 9,000 volumes can be accommodated. The entire area is air-conditioned, the ceilings are sound-proof, the lights fluorescent. A final esthetic touch is provided by the presence of two large potted plants. (It is hoped they will survive the rigors of life in a medical library.) Time, thought, and money have been expended wisely and well.

But a medical library is more than an area decorated in a striking manner and filled with comfortable furniture. It is a place of books and people; the storehouse of old ideas and the birthplace of new ones. It is a place where questions are asked and answers provided. It is as essential to a modern hospital as an operating room. When a hospital commits itself to extensive teaching and research programs, as the Infirmary has done in recent years, the importance of the library increases tremendously, for adequate and readily accessible literature is the backbone of both of these activities.

The Infirmary is fortunate in that the foundations of the present library were laid by men who were able to see beyond the needs of their own generation and thus gave to present-day readers a legacy of literature that is not equalled in any other special hospital devoted to eye, ear, nose, and throat.

In 1889 the surgeons of the Infirmary —Hasket Derby, B. Joy Jeffries, Gustavus Hay, and Clarence Blake — initiated an Ophthalmic-Aural Library. The Board of Managers voted the sum of $200 for the project — a large sum indeed for those days. One of the externs was named librarian. He received no salary and his name is not known because it does not appear on any of the records. During the years that followed, the number of journals and books devoted to the twin specialties was not large. This accounts in part for the fact that almost 40 years later there were only about 600 volumes in the library, yet this collection was remarkably complete and contained the majority of the journals, society transactions, and textbooks that are classics today.

In 1926, after a long career as an ophthalmologist, Dr. Lucien Howe of Buffalo, N. Y., gave a large part of his fortune to Harvard University, to be used to endow a laboratory for ophthalmic research. Knowing that research could not be done without literature, he also gave his large personal library and asked that a library of ophthalmology be established as part of the laboratory. Two years later, an agreement was reached between Harvard Medical School and the Massachusetts Eye and Ear Infirmary:

the laboratory and library were to be housed in the Infirmary, the book holdings of the Infirmary and the book gifts of Dr. Howe were to be combined, and the costs of the new library were to be met by the Infirmary and from the Howe endowments. This original agreement proved to be mutually satisfactory and the library still operates under that arrangement. Thus, the Lucien Howe Library of Ophthalmology is a joint project with two sponsors — the Massachusetts Eye and Ear Infirmary and Harvard Medical School. Its holdings are jointly owned, and both institutions formulate its policies.

Two rooms on the first floor of the Infirmary were assigned to the Howe Library. Shelves for 3,000 volumes were provided; furniture was purchased; a librarian, Mrs. Ada Messenger, was appointed; the Lucien Howe Library was ready for business.

It soon became apparent that the Howe Library was not to be solely a research library. In the first weeks of the library's life a pattern was set and that pattern has not changed in almost 28 years. Research workers, practising ophthalmologists, residents, nurses, medical students, hospital personnel, and outsiders all competed for the use of the library's material. A liberal policy was adopted by the Library Committee: anyone with a real interest in the literature could use the library; loans of books were restricted to those who held Infirmary and Harvard Medical School appointments.

As time passed, the holdings of the library first doubled, then tripled, and then threatened to quadruple. There is something inexorable about the way a library grows. The number of visitors increased until there were times when there were not enough chairs to accommodate them. At this point the situation was made still more critical by the assigning of a too-small section of the library in which to shelve the Ear, Nose, and Throat collection. Books were piled to the very ceiling, and it took a combination athlete and Sherlock Holmes to locate them. The old leather chairs began to burst at the seams. The great chandelier became dingier and dingier and gave, it seemed, less illumination with each passing year. The dust from Charles Street put layer after layer of grime on the books. Yet it was a happy, informal place. A generation of Eye and Ear men will always remember it.

In 1954, the Infirmary announced plans for its new Research Center. A solution to the space problem of the Howe Library was offered. It was decided to place the library in the same area as the laboratories. This is as it should be. Recent years have seen an extraordinary growth in medical research at the Infirmary. When the Howe Library was first planned, there was one man in the Boston area doing eye research; today there are about 30 whole- and part-time workers in this field. These investigators have written well over 300 papers on research. Much of the essential literature for these papers came from the Howe Library, and many of the bibliographies were prepared by the librarians. The future will see no lessening of this function; rather, the centralization of research activities and the subsequent increase in laboratory personnel will place a greater burden on the library. Wisdom dictated that the library should be near this important group of patrons.

The new quarters are quiet, clean, and striking in appearance. The readers are relaxed, and they enjoy working in the new atmosphere. The Infirmary management takes pride in the Howe Library, and no guided tour of the Infirmary is complete without a visit to the library.

An idea that began with a $200 donation 67 years ago is now a beautiful reality, and a vote of thanks is due the managers and surgeons of that earlier generation. A simple phrase from the Latin might be used to describe what has taken place since 1889—"Hoc opus, hic labor est". To which might be added in way of response—Well done.

Charles Snyder,
Librarian

At a meeting of the Executive Committee of the Massachusetts Eye and Ear Infirmary, held March 19, the following appointments were made:

Dr. Sidney R. Wilker—Assistant in Otolaryngology;

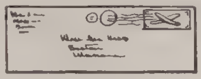
Dr. Richard J. Coffey—Graduate Assistant in Otolaryngology.

BIOGLETS

Dr. Howard S. Cameron, Assistant Resident in Orthopedics — born in Sarnia, Ontario, Canada, April 2, 1921; Lieutenant in the Royal Canadian Artillery, with service in northwestern Europe, 1939-45; M.D., University of Western Ontario, 1950; Intern, Ottawa Civic Hospital, Ottawa, Canada, 1950-51; Senior in Surgery, Victoria Hospital, London, Canada, 1951-52; Fellow in Pathology, University of Western Ontario, 1952-53; Chief Resident in Surgery, Westminster Hospital, London, Canada, 1953-54; Chief Resident in Surgery, Victoria Hospital, London, Canada, 1954-55; Fellow of the Royal College of Surgeons (Canada), 1955; married; one daughter; home: London, Ontario, Canada.

Dr. W. Pierce Smith, Resident in Medicine — born in Canajoharie, N. Y., March 31, 1923; Yale University, 1940-42; Pilot in the U.S. Army Air Force, with service in the 15th AAF in Italy, 1943-45; B.S., Yale University, 1947; salesman, 1947-49; M.D., Columbia University College of Physicians and Surgeons, 1953; Intern and Assistant Resident in Medicine, Presbyterian Hospital, New York, N. Y., 1953-55; married; one daughter.

Dr. Louis L. Weiss, Assistant Resident in Anesthesia — born in Passaic, New Jersey, February 23, 1912; A.B., Western Reserve University, Cleveland, Ohio, 1932; M.D., Western Reserve, 1936; Intern, Mercy Hospital, Canton, Ohio, 1936-37; Resident in Medicine, Mercy Hospital, 1937-38; medical practice, 1938-42; Captain in the Medical Corps, U.S. Army, with service in Hawaii, Guam, and Okinawa, 1942-46; medical practice, 1946-54; Resident in Anesthesia, Mercy Hospital, 1954-55; editor of the Western Reserve student publication, *The Tribune,* 1931-32, and of the Stark County (Ohio) Medical Society *Bulletin,* 1946-50.



Brief bits:—

Dr. Bradford Cannon recently returned from the Marshall Islands, where he went as a member of a medical survey team to examine a group of Marshallese who were exposed to radioactive fall-out in the spring of 1954. This unique experience proved fruitful, both professionally and personally. One of the members of the group was Dr. Charles E. Huggins (*S.* 1953), who will return to the M.G.H. as a surgical resident in a few months.

Dr. Benjamin Castleman was the guest speaker at the Annual Meeting of the St. Louis Pathological Society on February 24. His subject was "The pathology of the parathyroid gland". While in St. Louis he also gave a lecture on "Pulmonary embolism" to the second year class in pathology at Washington University. On March 1 he spoke on "The clinicopathological aspect of hyperparathyroidism" before the faculty and students of the University College of the West Indies, in Jamaica. On March 14 he conducted a clinicopathological conference at the Annual Meeting of the New Jersey Heart Association in Newark.

Dr. Oliver Cope addressed the staff of the Memorial Hospital in Worcester on March 1. His topic was "Diseases of the thyroid".

Dr. Shepard C. Ginandes announces the removal of his office for the practice of Psychiatry to 270 Commonwealth Ave., Boston, Mass.

Dr. Edward Hamlin, Jr. went to England on April 21 and will return on May 19. He will speak at the Postgraduate School of London University, King's College, and in Manchester.

Dr. Erich Lindemann addressed the International Association of Psychosomatic Medicine in Amsterdam, Holland, on April 18.

Dr. Laurence L. Robbins was a guest speaker at the Dallas Southern Clinical Society's 25th Annual Spring Clinical Conference in March. He spoke on "Roentgenologic manifestations of malignant lymphoma" and "The use and abuse of fluoroscopy". Dr. Robbins was in Atlanta, Georgia, in March, as an examiner for the American Board of Radiology.

Dr. George Saslow was one of the panel speakers on the subject "Care of mental patients in general hospitals" at the Thirty-third Annual Meeting of the New England Hospital Assembly, held in Boston in March.

Dr. Richard H. Sweet spent the week of March 12 in Rochester, N. Y., serving as Visiting Professor of Surgery at the University of Rochester School of Medicine.

We were glad to receive this letter from Lt. Charles E. Huggins, MC, USNR (*S.* 1953):

Dr. Edwin L. Carter (*S.* 1954) and I are working at the Naval Medical Research Institute in Bethesda. We have a very nice operating room for dog surgery and a laboratory for other work. We have been investigating a number of problems in the field of cardiovascular surgery. Most recently we have been concentrating on the problem of using differential hypothermia to assist in resections of the liver.

Dr. Carter has recently been promoted to Lieutenant, Medical Corps, USNR, and I was made Head of the Surgery Branch of the Naval Medical Research Institute six months ago.

We are having a wonderful time, but miss all at M.G.H. and hope to get back soon.

Nancy and I enjoy receiving THE NEWS very much.

No. 59 in a series of Staff photographs
Dr. Alfred H. Stanton, Psychiatrist in Chief, McLean Hospital

This letter from Dr. F. Dennette Adams will be of special interest to every MGH-er:

I have just returned from a tour of the Army Medical Installations in the European Command. During the course of my travels, the following members of the MGH family were encountered:

Captain Roy L. Byrnes (a.r.p. *Path.* 1954), at the Army Hospital in Munich.

Lieutenant Gerald M. Edelman (*M.* 1955), at the Army Hospital in Paris.

Captain Anne M. Jones, R.N., formerly a nurse in Baker Memorial and currently assigned to the Fourteenth Field Hospital, which is stationed at Bad Kreuznach, Germany.

Captain Reginald D. Kernan (*Path.* 1945), at the Army Hospital in Paris.

Colonel Frank Y. Leaver (clin. fel. *R.* 1948) is currently Commanding Officer of the U.S. Army Hospital in Nürnberg, Germany.

They all expressed the wish that I would extend greetings to their various friends at Massachusetts General Hospital.

In response to an appeal for news concerning his activities — professional and otherwise — Dr. Leslie C. Dodson (r.s. *P.H.* 1932), our "singleton" in Owensboro, Kentucky, has sent us the following data:

I came to Owensboro in 1933 and became associated with Drs. Hoover and Hoover, surgeons. Remained here until 1942, when I entered military service. Was located in the States and overseas until 1945, when I was discharged with the rank of Colonel. Returned to the private practice of general surgery in Owensboro. In 1947 I became associated with Dr. Howell J. Davis, surgeon.

Professional affiliations: Daviess County Medical Society; member of the staff of Owensboro Daviess County Hospital; Chief of Staff, Our Lady of Mercy Hospital; F.A.C.S.; member of the Southeastern Surgical Society, the Kentucky Medical Society, the Association of Military Surgeons, and the Southern Surgical Society.

Outside interests: Farming. I own two farms in Daviess County and raise Black Angus cattle and sheep.

Hobbies: Tennessee walking horses, hunting, and fishing.

Here is a letter from Dr. William McK. Jefferies (*E.M.* 1942) which makes very interesting reading:

I am still associated with the Department of Medicine at Western Reserve University, where we are having a fascinating experience with the new medical school curriculum. Much time and effort have gone into the planning of the changes, many of which might be classified as radical, but so far the results are promising.

One of the innovations has been the teaching by subject committees instead of by departments, and one of my duties has been the chairmanship of the Subject Committee on Endocrines and Metabolism for Phase 2B (third year). Another interesting innovation has been the use of a unit laboratory for each class instead of having separate student laboratories for each department, and I had the privilege of serving on the committee which designed these facilities. It was a challenging task to plan a laboratory in which students could perform experiments in anatomy, biochemistry, physiology, microbiology, and pharmacology at the same desk, but the results have been gratifying. Our first class of students to be exposed to the new curriculum is graduating this year, and it will be interesting to see how they compare with graduates of other schools on their internships.

We do not feel that we have achieved the ideal medical curriculum, but we think that most of the changes have been definite improvements and we are trying to better our teaching program each year, so it makes for an interesting experiment in medical education.

* * *

We want everyone to know what Dr. Robert S. Shaw has done for our Archives. In order that you may fully appreciate his contribution, we need to tell you a story.

A few years ago, when the door from the Moseley Rotunda into the Archives Room used to stand open, the glass which covered the face of our banjo clock in the Archives Room mysteriously disappeared. There were no traces of its having been broken and surreptitiously removed. The mystery remained unsolved until Mr. Piper, the well-known clock man on Charles Street, offered a possible solution when he told us that at that time there was a rash of thieving of parts of Willard banjo clocks—a pendulum from one, hands from another, a face or part of the works from another —until a complete clock could be assembled which would defy detection as being other than a perfect original. The loss of the glass from this particular clock was especially serious, in that this clock had been chosen by experts from all the available Willards and was shown in the Early Boston Exhibition given here in town a few years ago, as the most perfect example of Willard's best work. As soon as Dr. Barney learned about our loss, he and Mr. Piper set out to try to find a piece of old glass which could be cut, if necessary, to fit our clock. After months of unsuccessful search, Dr. Barney did the next best thing. He procured for us a piece of modern glass which at least has served to keep the dust from sifting into the works. However, a discerning person would notice at once that the glass was not of the Willard era, and every time we have looked at the clock we have missed the flecks, the particular color and quality, and other identifying features always present in old glass.

And now Dr. Shaw steps into the picture. He happened to come into the Archives Room not long ago. As he was looking about we noticed a puzzled expression on his face when his attention became fixed upon our Willard and we thought we knew what was bothering him. As soon as we told him the story of the disappearance of the glass, he said he had noticed at once that there had been a substitution. Then, to our delight, he said that tinkering with old clocks was his special hobby, that he had some old glass of his own, and that he would cut a piece to fit our clock and install it for us. Within a day or two the project was finished, and our precious old Willard was restored to its rightful dignity.

We feel sure that everyone affiliated with the Hospital will join us in our expression of appreciation for this very special contribution of time and talent—to say nothing of material — from Dr. Shaw.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 157 Boston, Mass. June 1956

DEDICATION OF THE JOE V. MEIGS CONFERENCE ROOM

The dedication of the Joe Vincent Meigs Conference Room by Mr. Louis Curtis, Chairman of the Board of Trustees of the Vincent Memorial Hospital, and the unveiling of Dr. Meigs's portrait by Dr. Langdon Parsons, Professor of Gynecology at Boston University, Obstetrician-Gynecologist-in-Chief at Massachusetts Memorial Hospitals, and a member of the Board of Consultation at Massachusetts General Hospital, took place on April 23.

Dr. Meigs's portrait, painted by Alfred Jonniaux, former Belgian Court Painter, was given to the Vincent Memorial Hospital by a group of Dr. Meigs's former assistants. In addition to Dr. Parsons, they include Dr. Somers H. Sturgis, Chief of the Gynecology Service at Peter Bent Brigham Hospital, Dr. John McLean Morris, Associate Professor of Gynecology at Yale University, and Dr. Howard Ulfelder, present Chief of Staff of the Vincent Memorial Hospital, and other members of the Vincent Memorial family.

Dr. Meigs graduated from Princeton University in 1915 and from Harvard Medical School in 1919. He joined the staff of Vincent Memorial Hospital in 1921, and, in 1930, was the first man to be appointed Chief of Staff. He became the first Chief of the Gynecology Service at Massachusetts General Hospital in 1941. He retired from these two posts on June 30, 1955, while continuing his teaching as Clinical Professor of Gynecology at Harvard Medical School. He is Consulting Visiting Gynecologist at Vincent Memorial Hospital and Consulting Visiting Surgeon at Massachusetts General Hospital.

Dr. Meigs has many foreign honorary fellowships, including one from the Royal College of Surgeons in Edinburgh. He is on the Board of Governors of the American College of Surgeons, and is a Diplomate of the American Board of Surgery and the American Board of Obstetrics and Gynecology. He has written several books and many medical papers.

Dr. Meigs is further honored by the fact that funds are now being raised to endow a chair at the Harvard Medical School in his name. The holder of the Joe Vincent Meigs Professorship in the field of gynecology will also hold the position of Chief of Staff of the Vincent Memorial Hospital and Chief of the Gynecology Service at the Massachusetts General Hospital.

PHILLIPS BROOKS HOUSE GENERAL HOSPITALS PROGRAM

The number of volunteers for hospital work declined somewhat at the end of World War II. The drop was quite understandable, in the case of women particularly, for untold numbers of women had sacrificed family pleasures and had even reduced household duties to a minimum in order to be of help during the emergency situation caused by the war. With the coming of peace, many volunteers gave up these outside duties and resumed their more normal ways of life. Many other faithfuls continued to contribute their time, however, and are still doing so.

By the 1954-55 college year, the need for more volunteers in hospitals had become increasingly apparent, and interest in Hospital Volunteer Services was revived when students at Harvard and Radcliffe decided to reorganize and revitalize the program. In September of 1955, Dr. Clark and Miss Wolf attended the opening rally for the Phillips Brooks House—General Hospitals Program. Approximately 300 students were present. Leaders representing various hospitals in this area spoke to the group, explaining the role of the volunteer in a hospital setting. As a result of this meeting, registration of students for active volunteer hospital service jumped from 30 to 124. Of these, 61% were premedical students, ranging from freshmen to seniors, and their remarkable record in the quality of their volunteer work can be largely attributed to their serious interest in medicine. Also, the contribution made by these Phillips Brooks House workers in five Greater Boston hospitals where they have been assigned presents to the public at large a new and potential significance of a college in any community.

We at Massachusetts General Hospital have had 40 of these volunteers assigned to us this past year. They have been working in the Blood Bank, in the Occupational Therapy Department, in the White Building, in Bulfinch, and in the Burnham Memorial. To date, many have qualified to receive the 100-hour American Hospital Association Volunteer Pin, having served the 100 hours during their college year. The majority of these volunteers are assigned for evening duties, serving from 6 to 10 o'clock.

We look forward to continued interest in the Phillips Brooks House—General Hospitals Program and to assistance from its members in our volunteer program for next year.

PHYSICS RESEARCH LABORATORY

The Physics Research Laboratory of the Massachusetts General Hospital was established in the summer of 1951, following the completion of the Research Building and allocation of space on the fifth floor for this purpose. The establishment of the laboratory was a result of a decision made in 1950 by Dr. James Howard Means and the Thyroid Laboratory that a physicist was needed to assist in the work of that laboratory. It was fortunate (for the author) that Dr. Means approached Professor Robley D. Evans of the Physics Department of the Massachusetts Institute of Technology for a suitable applicant for this position. This was a logical step, as the Thyroid Laboratory and M.I.T. had worked closely on numerous physical problems dating from the suggestion of President Compton of M.I.T. that radioiodine might be a useful aid to thyroid study. During the late 1930's and early 1940's, radioiodine was prepared in the MIT cyclotron and standardized by members of the Radioactivity Center under Professor Evans; and even after the availability of radioiodine from the nuclear reactor, M.I.T. cooperated on many problems of radiation measurement.

The Physics Research Laboratory was organized within the Department of Medicine, which at that time was under the able direction of Dr. Means, and subsequently of Dr. Walter Bauer. The primary purpose of the laboratory was to provide assistance in physical problems to other groups in the Hospital, and any success that the laboratory has had can be attributed to the stimulation and active cooperation of others in these joint efforts. Before delving into the various activities of the Physics Lab, it might be well worth while to comment on this aspect of collaborative work. There are few places in the country where such cooperative efforts would be possible. The enthusiasm with which many at the M.G.H. have accepted the Physics Lab has been nothing short of amazing, and in a sense it reflects the avid interest in basic research and clinical investigation which pervades the Hospital.

One reason for the ready acceptance of the Physics Laboratory in the M.G.H. has been the tremendous potential of recent physical developments for the fields of biology and medicine. It should be stressed that aid with physical problems in the Hospital had been received from many quarters long before the establishment of the Physics Lab, and even now collaboration with other laboratories on physical problems is increasing. Even within the Hospital the influence of physical scientists has increased outside the Physics Research Laboratory. Two notable examples of this trend have been the appointments of Dr. Ted Webster as a physicist in the Department of Radiology and Dr. Theodor Hueter as a physicist in the Department of Neurosurgery. The end of this trend does not appear to be in sight, and one might hope that the exploitation of physical sciences in medicine is only now commencing.

One of the first tasks that was undertaken in cooperation with the Thyroid Lab was the design and construction of apparatus for measurement of thyroid uptakes and thyroid function. To this end, a four-scintillation counter array was designed during 1951 and put into operation. This set-up, with certain modifications, has been in operation since then and has served as a prototype for many similar counting arrangements at other hospitals in this area. Shortly afterward, a directional counter was designed and constructed for measurement of activity within small areas of the thyroid gland. This counter has similarly been used routinely for a number of years. At the time these devices were constructed, canned sodium iodide crystals were not available, and a design for canning crystals was used which has proved perfectly satisfactory. Since that time, a number of other pieces of apparatus have been designed and constructed, including an automatic scanning machine for measuring the activity of chromatographic strips and various well counter arrangements for measuring samples of I^{131}.

Although the design and construction of apparatus for thyroid measurement has introduced many interesting and stimulating physical problems, an equally important facet of collaboration with the Thyroid Laboratory has been the study of the thyroid gland itself. Early in the use of I^{131} for the study of thyroid iodine metabolism, it became apparent that specific activity curves could readily be obtained which could not as readily be explained. Mathematical approaches using simple model theories were set up to assist in the explanation of these specific activity curves. As an outgrowth of this and other tracer problems, an analogue computer was designed and built in the Physics Research Laboratory for analysis of specific activity curves. This computer has proved to be of considerable value in the qualitative understanding of biological data and has stimulated the construction of a more complex unit which is under design at the present time. One of the high points in the collaboration with the Thyroid Laboratory was the study of endemic goiter in Mendoza, Argentina, which was carried out during the summer of 1951. This study used apparatus which was designed here, and model theory was used extensively in the analysis of the resulting data.

More recently, the Physics Research Lab has collaborated with studies of calcium metabolism performed by Dr. John Stanbury and Dr. Stephen Krane of the Thyroid Laboratory. These studies have used some of the same techniques as in the iodine studies, but have introduced new and in certain cases more difficult problems.

Cooperation with the Neurosurgical Service of the Department of Surgery, and particularly with Dr. William Sweet, has been of tremendous value to the Physics Research Laboratory. One of the first projects carried out in collaboration with Dr. Sweet was an attempt to localize brain tumors by means of a preoperative isotope test. Prior to this, Drs. Selverstone, Sweet, Solomon, and Robinson had shown that P^{32} concentrated in brain tumors and could successfully be used as a diagnostic technique at the time of operation with the aid of a small probe counter. It was desired to extend this isotope technique, but to use a detection system which would allow measurements to be made external to the head. Isotopes which emit positrons were investigated in order to make use of the unique property of positrons to annihilate and to send two annihilation quanta in exactly opposite directions. The use of such isotopes in a successful diagnostic technique has now proved to be possible, and instrumentation and techniques have been developed which have fulfilled this desire. Over the past three years, approximately a thousand patients have been scanned with this positron technique, the scanning being under the able direction of Miss Pauline Montgomery. Reports have been presented to Neurosurgical Societies, the A.M.A., and at the Geneva Conference on Peaceful Uses of Atomic Energy in July of 1955.

Although the technique is considered to be a routine clinical diagnostic technique, numerous possibilities exist for its improvement. During 1953 Dr. Saul Aronow came to the laboratory from the Department of Applied Science at Harvard and assisted in the design and construction of an improved model of the positron scanner. This device is now completed and uses many of the latest electronic techniques. Although it is still being used on an experimental basis, results to date give promise of considerable improvement over the original model. In addition, numerous isotopes other than the As^{74} now being used are currently being tested. Among these are Rb^{84}, Mg^{52}, Cu^{64}, and Zr^{82}. Many of these appear particularly applicable to specialized types of disease.

A second collaborative effort with Dr. Sweet shows promise of greater usefulness in the near future. Dr. Sweet has devised and carried out a procedure for therapy with boron^{10} and subsequent irradiation with thermal neutrons. The boron is itself inert and the thermal neutrons have a minimal biological effect. However, the capture of a thermal neutron by boron^{10} causes the release of large amounts of ionizing energy. Studies show that B^{10} concentrates in brain tumors in sufficient quantity so that an appreciable radiation dosage could be given to the tumor in relation to the surrounding normal tissue. Two series of patients have been irradiated at the reactor at Brookhaven. The Physics Research Laboratory has assisted in calculating the radiation dosage received in this technique and have attempted to devise instruments to be used in measuring the actual irradiation dose during the irradiation. At the present time M.I.T. is letting contracts for the construction of a reactor to be built near the MIT campus which will include a medical facility for this purpose. We are looking forward to the possibility of collaborating even more closely on the numerous instrumental problems that will arise in the use of a reactor in this vicinity for this therapeutic technique. This reactor, when completed, should stimulate even greater interest in the field of radiation biophysics, both from the use of short-lived isotope and in the availability of a high-level irradiation source for biological media.

Dr. Aronow has further put his electrical engineering talents to work in designing a high-frequency lesion maker for neurosurgical procedure which has proved to be of considerable practical value. Perhaps the most important application has been in connection with the efforts toward pain relief by Dr. James C. White.

There have been numerous collaborative efforts with others in the M.G.H., although generally of a smaller nature. One such project has been the development of a device for automatically recording blood pressure. This device was suggested by Dr. James H. Currens and the development carried out with his cooperation. The recorder has been successfully used and, in addition, has led to a study of the source and meaning of Korotkov sounds.

The second role of the Physics Research Laboratory has been to provide certain service functions for the M.G.H. One of the first of these has been the mass spectrometer which is available for routine analysis of stable isotope concentrations. These measurements are useful in determining water volumes by use of D_2O or in carrying out tracer experiments with stable isotopes such as those of nitrogen, oxygen, and carbon. Both deuterium and nitrogen samples have been analyzed on a routine basis, and it is planned to extend this service to carbon and oxygen. In addition, it is planned to investigate the possibilities of other mass spectrometer measurements in medical research. The Physics Research Laboratory has maintained numerous instruments such as scintillation well counters and standardization devices for use of others in the Hospital. The Hot Lab in the basement of the Research Building has been equipped to provide for handling of radioactive materials in medium-level quantities. In addition, aid has been given through the Isotope Committee in the solution of many problems in the handling, storing, and disposing of radioactivity within the Hospital.

The third category of activities in the Physics Research Laboratory has been in independent research. In many cases, it is difficult to separate these projects from the collaborative efforts. For instance, successful scanning and localization of brain tumors has led to an attempt to visualize other areas of the body, such as liver and pancreas. At the present time, a scanning device specifically for this purpose is being constructed and various isotopes such as those of zinc and copper are being explored for their possible use in the visualization of internal organs.

Dr. Walter S. Michel, a physicist from the Canadian National Research Council, came to this laboratory in 1954 and has performed a rather basic and thorough study of the application of plastic scintillators to the detection of beta rays. An automatic recording spectrometer was set up for this study and it has been used widely for this and many other studies since then. As a result of this study, a plastic well scintillation counter has been developed for the detection of energetic beta rays. This counter has been applied to double tracer experiments. By using two detectors selective for two isotopes, simultaneous measurement of the two tracers may be performed in the same sample. This technique has been particularly useful in simultaneous sodium and potassium determinations, but many other isotope pairs have been analyzed.

Basic studies have also been performed on various aspects of radiation detection, such as the use of focussing elements. In addition, preliminary studies have been carried out on the effect of low temperatures on biological materials, and on the biologic effects of ionizing radiation.

In an academic community such as Boston, teaching must play an important role in any scientific laboratory. Working with students and with academic institutions has the very real advantage of introducing new ideas and new approaches to problems in the laboratory as well as aiding in the task of keeping up with the recent developments in the field. The author has aided in the teaching of elementary physics courses at M.I.T. as well as in an advanced course in nuclear physics. During the past year, a course on biological effects of radiation and physical dosimetry was given in the Department of Nuclear Engineering at M.I.T., and the nuclear physics portion of a nuclear engineering course was undertaken. Dr. Aronow is currently teaching a course in electronic techniques at Northeastern University.

A number of MIT students have performed their work here for B.S. theses in the Physics Department of M.I.T., and two students have carried out work for their Masters degrees here. Two students working under Northeastern University's industrial cooperation plan will be at the laboratory for the coming school year. This type of association is particularly valuable both from the assistance the student can give to the laboratory and from the fact that it allows the student to see the type of physical work performed in a hospital. The demand for physicists and engineers with medical or biological inclinations is already evident, and if the present trend continues a marked shortage of such personnel will soon exist. By far the best method of attracting students into the field is to allow them to actually see the work being performed.

Gordon L. Brownell, Ph.D.,
Associate Physicist

The Board of Trustees, at their meetings on April 13 and 27, voted:

To grant the full-time Chiefs of the Orthopedic, Medical, and Surgical Clinics permission to see a limited number of private patients in their Clinic offices.

To appoint:

Dr. Jacqueline Gauthier as Assistant Resident in Psychiatry, beginning July 1;

Dr. Robert H. Hansen as Assistant Resident in Anesthesia, to become effective as of October 1, 1956 rather than October 1, 1955, as originally appointed;

Dr. Robert E. Key as Assistant Resident in Orthopedic Surgery for one year, beginning November 23;

Dr. Richard C. Packert as First Assistant Resident in Radiology, beginning approximately October 1;

Dr. Alfred L. Weber as Second Assistant Resident in Radiology, beginning July 1;

Dr. Masao Yatsuhashi as Clinical Associate in Surgery, effective as of April 1.

At their meetings during April, the General Executive Committee voted:

To accept the resignation of Dr. John J. D'Urso from the position of Clinical Assistant in Dermatology, effective March 30.

To promote:

Billy Baggett, Ph.D. from the position of Assistant in Biochemical Research to that of Assistant Biochemist (Medicine), effective September 1;

Dr. Richard A. Mayo from the position of Assistant Resident to that of Senior Resident in Orthopedic Surgery, for the period July 1 through December 31;

Dr. Edward C. Parkhurst to the position of Senior Assistant Resident on the Urology Service for one year, beginning July 1;

Dr. Hermann K. Schueler from the position of Assistant Resident to that of Resident on the Urology Service for one year, beginning July 1.

To reappoint:

Elizabeth B. Keller, Ph.D. as Assistant Biochemist (Medicine), effective July 1;

Leonard B. Spector, Ph.D. as Assistant Biochemist (Medicine), effective July 1.

To appoint:

Dr. Hugo del Bosque as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Robert C. Detwiler as Clinical Fellow in Orthopedic Surgery, for the period July 1 through December 31;

Dr. Herbert R. Karp as Clinical Fellow in Neurology for one year, beginning July 1;

Harry D. Peck, Jr., Ph.D. as Research Fellow in Biochemistry, beginning September 1;

Dr. William Sharpe, Jr. as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Taeko Sumi as Clinical Fellow in Psychiatry, effective as of March 1;

Dr. Frederick S. Tomchik as Clinical Assistant in Radiology, effective as of April 12.

New addresses:—

Dr. Boris Senior (*C.M.* 1950), 904 Medical Centre, Jeppe St., Johannesburg, South Africa

Col. Milton S. Thompson, MC, USA (*Or.* 1934), Walter Reed Army Hospital, Washington 12, D. C.

Dr. Lionelle D. Wells (clin. assoc. *Psychiat.*), 270 Commonwealth Ave., Boston, Mass.

Capt. Frederick E. Whiskin, MC, USAF (r.p. *Psychiat.* 1954), 6407th USAF Hospital, APO 323, c/o Postmaster, San Francisco, Calif.

Brief bits:—

At the annual meeting of the American Surgical Association, held at White Sulphur Springs, West Virginia, on April 13, the following MGH graduates were elected to active membership: Dr. Allen M. Boyden (*W.S.* 1934) of Portland, Oregon, and Dr. John W. Raker (*E.S.* 1942) of Philadelphia. The following papers were presented by members of the MGH staff: "Bleeding esophageal varices—A study of the cause of the associated 'hepatic coma' ", by Dr. William V. McDermott, Jr., et al., and "Anterolateral cordotomy (high thoracic): Postmortem correlation of extent of lesion with relief of pain and possible complications", by Dr. James C. White and Dr. William H. Sweet.

Dr. Otto E. Aufranc has given the following lectures during the past few months: "Mold arthroplasty of the hip: Surgical technique, indications, and results", at the meeting of the American Academy of Orthopedic Surgeons, held in Chicago on January 31; "Indications for and results of mold arthroplasty of the hip", before the American College of Surgeons, in Philadelphia, on February 14; "Orthopedic management of rheumatoid arthritis: Types of surgical procedures that are available", at Lemuel Shattuck Hospital, on February 29; and "Indications for and results of mold arthroplasty of the hip", at the meeting of the Olean Medical Society, in Olean, N. Y., on April 12.

Dr. Joseph S. Barr delivered a lecture on "Radiation as it affects the orthopedic surgeon", at the Military Medical-Dental Symposium on Atomic Warfare, held in Boston on March 22.

Dr. Oliver Cope is the Visiting Professor of Surgery at the University of Cincinnati, College of Medicine, from June 4 through 9. He delivered the address to the graduating senior class and the alumni on Thursday, June 7. The title of his address was "The conflict between facts and wisdom in medicine".

Miss Frances M. Hernan, Director of our Credit and Collections Unit, was elected the first woman president of the Retail Credit Grantors of New England and Eastern Canada, at their 35th annual conference, held recently in Springfield, Massachusetts.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of The News, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THE CLASSIFICATION. THREE AUTHORS FAILED TO INCLUDE THAT INFORMATION THIS MONTH. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Dermatology

Blank, I. H.
Allergic hypersensitivity to an antiseptic soap.
J.A.M.A. 160:1225-1226.

Endoscopy

Atkins, L., and Benedict, E. B.
Correlation of gross gastroscopic findings with gastroscopic biopsy in gastritis.
New England J. Med. 254:641-644.

General Surgery

Churchill, E. D.
The operation to be undertaken.
In Cancer of the lung: An evaluation of the problem — Proceedings of the Scientific session, Annual Meeting, American Cancer Society, Inc., Nov. 3-4, 1953, New York, N.Y., American Cancer Society, Inc., pp. 231-237, 1956.
Churchill, E. D.
Primary cancer of the lung.
In Cancer — A manual for practitioners, Boston, American Cancer Society (Massachusetts Division), Inc., 3rd edition, pp. 170-179.
Churchill, E. D.
Tumors of the lungs and bronchi.
In Christopher's textbook of Surgery, Lloyd Davis, M.D., Editor, Philadelphia, W. B. Saunders Company, 6th edition, pp. 430-436.
Hamlin, E., Jr., and Vickery, A. L.
Needle biopsy of the thyroid gland.
New England J. Med. 254:742-746.
Waddell, W. R.
The physiologic significance of retained antral tissue after partial gastrectomy.
Ann. Surg. 143:520-530.

Laboratory Science

Geyer, G., Herbst, F. S. M., Thaler, H., and Lever, W. F.
The permeability of capillaries to serum cholesterol.
J. Clin. Investigation 35:281-284.
Matoltsy, A. G., and Odland, G. F.
Observations on the orientation of keratin in thickened cornified epithelium of the human skin.
J. Invest. Dermat. 26:121-126.
Schmid, K., Rosa, E. C., and MacNair, M. B.
Fractionation of the proteins of human synovial fluid and plasma.
J. Biol. Chem. 219:769-780.

Neurology, Neurosurgery, and Psychiatry

Brown, M. R.
Medical progress: Diseases of muscle.
New England J. Med. 254:321-326.
Farnsworth, D. L.
Pain and the individual.
New England J. Med. 254:559-562.
Farnsworth, D. L.
Some observations on the attitudes and motivations of the Harvard Medical School student.
Harvard Med. Alum. Bull., January, 33-35.
Lindemann, E. (Editor)
Brief psychotherapy of a patient with headache and endometriosis.
Am. J. Med. 20:286-291.
Sifneos, P. E., Gore, C., and Sifneos, A. C.
A preliminary psychiatric study of attempted suicide as seen in a general hospital.
Am. J. Psychiat. 112:883-888.
Talland, G. A.
Cultural differences in serial reproduction.
J. Social Psychol. 43:75-81.

Otolaryngology

Kelemen, G.
Erythroblastosis fetalis: Pathologic report on the hearing organs of a newborn infant.
A.M.A. Arch. Otolaryng. 63:392-398.

Books

Churchill, E. D.
The surgeon and the university.
Kingston, Canada, Queen's University at Kingston [privately printed].

When the request came for a contribution to the columns of the MGH News, the most arresting argument as to why I should respond was "since you are one of the two oldest house staff members in terms of time of service. . . ." After initially wincing at being so fixed in time, two thoughts came to mind: (1) Thank God for Paul Russell; (2) certain avuncular reflections on the content of the years which brought me the dubious honor of such seniority.

In 1950, after two intense years of Bulfinch battering, Laurens White, Craig Lichtenwalner, Mackensie Walser, and I flew to Europe in earnest pursuit of "la vie en rose". There followed three brimming months of The Grand Tour plebeian-style. In the beginning, sightseeing was approached with the obsessive thoroughness of morning work rounds, but with a pleasant lapse into languor as the weeks rolled by. But even as we drifted in awe amid the history, art, and biology, the news of the Korean war began to fill the papers. Our flight back to the U.S.A. was also one into the military service.

After being inducted into the Army and receiving basic training in Texas for five days (i.e., how to salute and fill out pay forms), I received a fortunate assignment to the Army Medical Service Graduate School at Walter Reed Hospital. Also round Washington in uniform at that time were Bill Christenson (*M.* 1949), Don McCann (*M.* 1949), and Bob Fishman (r.p. *N.* 1950). For almost a year my duties were basically those of helping to care for the great number of patients with hepatitis who were filtering back from the Far East. There was some additional time, however, for a few forays into certain problems of clinical research.

In 1951, I was assigned to the so-called Surgical Research Team and flew to Korea with a broad mandate to study "whatever problems may seem important to improve the care of the wounded". Here began a most valuable series of experiences. It would be fruitless to attempt here any picture of the Korean war at that time. Many letters and articles have appeared in the MGH News from MGH-ers who were much more intimately and much longer involved in the police action than was I. It soon became apparent that although the main military medical problems were triage and good, early, surgical care, posttraumatic renal insufficiency was a major cause of death in the severely wounded. We therefore established an Anuria Center at an evacuation hospital within helicopter range of the front lines, and were soon delighted to have a fairly complete laboratory (even with a flame-photometer) functioning in this former rice paddy. At this point I telephoned from Pusan to Washington to say that we needed an artificial kidney and to ask permission to return to get it and certain other specialized research supplies. Clearly hearing a 10,000-mile affirmative, I gladly left my colleagues huddled in their cold tent and hurried back to the U.S.A., with the usual judicious dragging of one's feet in Japan for tourist purposes. In Washington, about ten days later, I walked into the colonel's office to announce, "I've come for the kidney." Said he testily, "We sent it last week!" Needless to say I was shortly back in scenic Wonju, having overtaken the kidney in Tokyo. It was successfully put into use with a large series of patients and seemed to contribute to a significant lowering of the mortality rate in acute renal failure. The only MGH-er I saw in Korea was Roger Wilcox (*S.* 1949), who turned in an excellent job as a surgeon at one of the forward hospitals. As a measure of his fierce independence, however, he disdained khaki and wore a scarlet, long-billed baseball hat, looking for all the world like a 38th parallel Casey Stengel. Visiting his tent sometime after his hospital had been strafed, I was greatly impressed with a yawning chasm in the earth next to his bunk—a "bug-out hole", into which he could wriggle at will while still in his sleeping bag. "Another foot," he said, "and they would have me for desertion!" In the summer of 1952, I returned from the Far East—after a brief detour to Formosa, Hong Kong, Siam, and the Philippines—and managed to extricate myself from the military service.

At this time I took up residence in Cambridge as a member of an unusual aggregate known as the Harvard Society of Fellows. In a pragmatic, workaday world, no fellowship could seem more effete, for one's sole duty is to appear each Monday evening in a special panelled dining room in Eliot House and linger over a four- to five-course dinner, wetted down with at least four varieties of vintage wine from the Society's own imported stock. During this gastronomic rite one may, if so inclined, engage in desultory or polemical conversation with a score of mathematicians, physicists, historians, economists, biologists, and other nonmedical esoterica, among whom are the president and dean of the University. For performing this arduous task one is given quarters, a salary, and freedom to roam the University. The leap from Wonju to Eliot House within two months was incalculable. Between Monday night duties I grubbed away in synthetic chemistry.

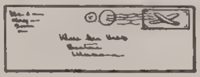
After some weeks in the isotope course at Oak Ridge in the summer of 1953, I joined Dr. DeWitt Stellen, Jr. at the Public Health Research Institute of New York City, still under the sponsorship of the Harvard Society of Fellows, who waived any local duties. This year was ostensibly given over to the investigation of certain aspects of purine and pyrimidine metabolism, but looms more important in my personal annals as the year in which I was married.

In the summer of 1954, we flew to England, *en route* to spend a year at the Karolinska Institute in Stockholm. The route to Stockholm sagged pleasantly southward via the Riviera, Italy, Austria, and Germany.

Stockholm is a beautiful city on islands between Lake Mälaren and the sea—sparkling, clean, and polished. The work carried out in Professor Einar Hammarsten's laboratory was related to certain aspects of citrulline and pyrimidine metabolism. My most successful synthesis, however, became evident at the birth of Virginia Constance Smith via midwife, as is the Swedish custom. By coincidence, Don and Barbara McCann were also in Stockholm for the same academic year, where Don was engaged in excellent experimental neurophysiology relating to the so-called thirst center. Bill Peete (*S.* 1948) spent several weeks in Sweden on one lap of his peripatetic Moseley Fellowship. There is a saying in Europe to the effect that most Swedes are born two drinks under par. There was a somewhat formidable formality on casual encounter, but during our months there we made a number of good friends in the small academic community in which we lived. It is difficult to describe the oppressiveness of the long dark winter, during which a full moon could sometimes be seen at 3:30 P.M. A high point during this season was the Nobel Prize ceremony and attending State banquet-dance in the famous City Hall. We were particularly glad to be witnesses of Dr. John Enders's reception of the award. Some time before this I had a chance to meet the King of Sweden, Gustaf VI, who expressed great interest in the fact that I was from Harvard, we being fellow graduates by virtue of his honorary degree of about twenty years ago!

In the late spring of 1955, we left Sweden with considerable reluctance and returned to the U.S.A. after a pleasant trip through northern Europe to England. In New York City began a six-months' period of duty on the medical house staff of the Presbyterian Hospital —a return to clinical medicine after a five-year interlude of Army and chemistry, marriage and family. All in all, it was a pleasant and valuable diverticulum from the main stream of clinical training. In retrospect and analysis, I think I would enter it again.

Lloyd H. Smith, Jr., M.D.,
Chief Resident in Medicine



This brief but cordial note has come from Dr. E. H. Trowbridge, Jr. (a.r.p. *N.* 1940):

> I cannot let this issue go by without telling you how much I enjoy keeping up with the times by reading THE NEWS.
>
> Massachusetts General Hospital is certainly to be congratulated on receiving the large donation from the Ford Foundation.
>
> Since returning from the Service, I have been located at 1405 Bryant Building, 1102 Grand Avenue, Kansas City, Missouri, and last March I associated myself with Dr. John D. DeMott in the practice of Psychiatry, Neurology, and Electroencephalography.

Dr. Herschel D. Collins (*M.* 1953) sent, by dictaphone belts, a detailed description of conditions in Alaska to Dr. Mitchell T. Rabkin, one of our Interns in Medicine. Dr. Bauer has very kindly sent us a transcription of the communication. It reads, in part:

> I hope you will excuse this method of writing a letter. There is a lot to say about Alaska, and if I were to write it all in longhand it would be far less than I would like to say about it.
>
> First of all — Anchorage. This is a rather new city. It was started in 1905 but, until 1940, the population was about 4,000. Then, with the establishment of the Elmendorf Air Force Base here, it grew very rapidly and decidedly shows this. It is a fairly rough city, with lots of bars, saloons, night clubs, and houses of prostitution. There are a fair number of robberies and murders, but not to an alarming degree.
>
> The downtown section has a fair number of good stores, which all charge very high prices. You should stock up well on clothing of all types, especially heavy clothing for winter, before you come. Food is also high, with steak going at $1.50 a pound, milk at 45 cents a quart, and bread at 45 [?] cents a loaf. However, the use of the commissary at the Elmendorf Air Force Base eliminates the problems of high food costs as far as Public Health Service personnel is concerned. We manage to get along on $120 a month for food. For two people, it would be considerably less — probably about $80 a month. Around the outskirts of the town there are several housing projects in which there are usually a few houses for rent. We are renting a house in one of these projects at $120 a month. It is a two-bedroom house with living room, bathroom, kitchen, and attached garage. It is a rather cheaply built house, with a concrete slab floor, and in Boston would run at about $10,000 or $11,000 to buy. Here they want $16,900 for this house. Some rather poor financing has been done in the past, and thus a lot of the houses are in receivership because the original builder went bankrupt. Utilities for this house cost us $50 a month, and, in addition, there is a $50 deposit made in case we leave the place damaged. The installation of the utilities costs the exorbitant fee of $75, which is returned when we move out. Approximately the same situation exists with most of the apartments or houses that you might rent should you come here. There are two large apartment buildings in town, fairly close to the hospital, which charge from $120 to $150 a month. Most of these apartments come already heated, so you would save the $20 to $30 a month that we have to pay for oil. They are fairly readily available except during the peak construction months during the summer. The apartment and housing situation will be in a big turmoil this spring or summer, because the 71st Division, which is stationed at Fort Richardson, will be moved *en masse* to Fort Lewis, Washington, with a shift in the Division that is there to Fort Richardson.
>
> Anchorage has its nice features and bad features. The nice features are a beautiful view of the Chugach range of mountains behind the town, and the Alaska range which can frequently be seen across the inlet. Also, from the hospital we can often see Mt. McKinley, as if it were only about 20 miles away. On the other hand, Anchorage has its bad points. The roads in town are just being paved in many areas. Most of the back streets are unpaved, and are extremely bumpy, and muddy or dusty, depending on the season. The place is loaded with junk yards, and there is a decided lack of lawns and trees in most of the residential areas. For entertainment and recreation, there are a couple of theatres in town which are quite expensive and some on the Base which are cheap. There is a choral group which gives infrequent concerts and also a home-town symphony orchestra which gives infrequent concerts. The only plays are those given by a little theatre group. They have given one play since I have been here. The number of scientific and medical meetings is small. The 5005th Hospital at the Elmendorf Base has a monthly medical meeting which is mediocre. Entertainment, thus, is directed mostly to outdoor activities. Boating on the inlet is practically nil. The tides are tremendous — 25 to 28 feet, with rapid currents of water. Very few people have boats on the inlet. In addition, the fishing on the inlet is not very good. Fishing close to town is also fairly scarce. However, down on the Kenai Peninsula, which is 120 to 180 miles away by car, one can enjoy the sport of catching salmon as they run up the stream during the summertime.
>
> The skiing here is excellent, with a very nice hill about 15 miles from town. There is a joint project by the Anchorage Ski Club and the Fort Richardson recreation set-up. They have rope tows, and for military personnel (which we are considered) it costs only 25 cents to ride them all day.
>
> The weather is fairly cold in the summer for swimming in the local pond, and there is only one indoor pool that is open to the public — or, rather, open to members of the Club. You have to pay about $100 a year to belong to the Club.
>
> The hospital here, as you know, is a new and excellent structure. The laboratory is adequate for ordinary procedures, and we are able to send out such things as protein-bound iodines. We will be getting a flame photometer some time in the near future. Bacteriology is good. The x-ray department is being run by me, as is the laboratory, and obviously is fairly poor quality. We, however, do do pyelograms, bronchograms, g-i series, barium enemas, and, depending upon whom we have for technicians, can get accurate films. The equipment is good.
>
> The second floor of the hospital has about 106 beds. One wing of this floor is obstetrics and has had a rather low patient population. Two wings are tuberculosis — one pediatric tuberculosis, where there is quite a bit of miliary tuberculosis and some bone and joint tuberculosis, the other is adolescent boys, mostly with pulmonary tuberculosis. Another wing, with about 36 beds, is pediatrics. The pediatric problems are very interesting. There are a lot of acute pneumonias, otitis, and hepatitis. A number of patients are sent in for evaluation and chronic disease program, with orthopedic

THE UNVEILING OF THE PORTRAIT OF DR. JOE V. MEIGS
Left to right: DR. MEIGS, DR. LANGDON PARSONS, WHO UNVEILED THE PAINTING, AND MR. LOUIS CURTIS, CHAIRMAN OF THE BOARD OF TRUSTEES OF VINCENT MEMORIAL HOSPITAL, WHO DEDICATED THE JOE VINCENT MEIGS CONFERENCE ROOM

difficulties, and we have had such rare birds as methemoglobinemia. As I was saying, they have some rare diseases in pediatrics. This department, fortunately, has been left pretty much up to Dr. Wheeler. He is a very fine fellow and tries to take good care of his patients. He has the help of a consultant, who is a private practitioner in the community, named Towers. This fellow was a friend of Hardy Hendren's when he went to Dartmouth. They also have the pediatrician at the Base Hospital, who comes in about once a week.

The third floor is all female tuberculosis patients — about 106. These people, as patients, are extremely nice. Most of them are Eskimos. They are placid and quiet, clean and good-natured, and are extremely appreciative of what you do for them. I found them a pleasure to take care of, and wished I had been able to keep them as my patients. In general, they are fairly young — many of them in their twenties, and they have all degrees of tuberculosis. There is some renal tuberculosis, and one case of tuberculous meningitis on the ward. There are only a couple of hypertensives among this whole group and very few other complicating medical diseases except dental caries and eye diseases.

The fourth floor of the hospital again has about the same capacity. One wing, approximately 36 patients, is devoted to surgery. Acute surgical cases are hospitalized there, as well as postoperative thoracic surgery cases who are now convalescing, and orthopedic and ENT patients. Another wing, again with about 36 patients, is devoted to acute medical problems. These are much as we would have in Boston. There are a few carcinomas of the lung, esophagus, stomach, ovary, etc. There is a rare case of rheumatic heart disease with congestive failure. There is not much in the way of coronary heart disease that comes in here. Evidently, they all die off in the villages. We occasionally have an employee with coronary heart disease. Ulcers, renal disease, and psychosomatic disease make up most of the rest of the cases on the fourth floor.

The fifth floor is devoted to male tuberculosis patients, again about 106.

When the hospital is full, we have a total bed capacity of round 400. We have been running about 330 patients. Currently, it is slightly below because the funds for transporting the patients back and forth from the hospital are low. We see approximately 600 out-patients in a 20-day period. True, many of these come for trivial complaints—colds, sore throats, and minor sprains among the employees — but there are also a number of interesting pediatric problems, some dermatology, and cases for our specialty clinics.

We drove up here — about 5,700 miles from Caribou, Maine. It was quite an ordeal, with two children, and I think that probably a person would be wise not to try it under those conditions. However, a couple could do it much more easily, and I think you would prefer to drive than to come by plane. You would need to have a fairly good car, because the road is rough all the way from Edmonton, British Columbia, until you get to the paved road in Alaska. There are an adequate number of places where you can get repairs along the way, and truck-drivers and other travelers are good about stopping to help you should you have any trouble. The government will pay you as if you drove to Seattle and then flew up here, and they do not pay you for what it would cost to have your car sent up. You should have four new, nylon, four-ply tires on your car, and a good spare. Nylon tires are advantageous because they don't blow out on the gravel roads. I suppose that six-ply rayon tires would also be all right. In addition, you should put some rubber tubing over your gas tank so that you won't get a hole in it from flying rocks. This is good advice, since I didn't do it and I got a hole in my gas tank. If you decide to send a car up, it costs about $250 to send it from Seattle to Anchorage, and the government doesn't pay you for this, as I said before. The only other way is to get the car shipped up on the Department of Health ship, *North Star*, which leaves Seattle three or four times a year. Its last trip out of Seattle is usually some time in July, and you would have to contact Mr. Farrow there to find out if you could send your car to Anchorage via the *North Star*. This costs only about $50. If you were going to buy a car here, you would find that they are quite overpriced, especially the new models. Older models are fairly reasonable.

To sum it up, I would say that the Public Health Service has certain advantages. 1. You can get in on the date when you want to get in and you know when you will be getting out. 2. You are highly likely to stay in one place during the entire two years. 3. There is not a great deal of regimentation. Also, you do not have to wear a uniform. If you come into the Indian Service you should not even buy one. It has disadvantages in that you don't get the same type of life insurance as you get in the Army and you don't have what veterans' benefits there may be, according to the time you are in. Above all, I think you should come into this situation with a bit more of an open mind than I had about what you are getting into. I expected entirely too much, evidently, and was disappointed.

Dr. Means has very kindly passed on to us this interesting letter he received from Dr. Guillermo C. Sanchez (*M.* 1950), written from Korea:

It was a delightful surprise to receive the long and kind letter from you a couple of days ago, and I was very pleased to get news of Ike Taylor and his activities down in Antarctica. I shall certainly write him in June, as you suggest.

My experiences here, though so much less unique than his, have also been fascinating, and were it not for the rather long and painful separation from my family, I would consider it one of the more exciting periods of my life.

If one has to come to Korea, everyone is agreed that Pusan is the ideal spot. The climate is mild—something like that of Georgia or South Carolina—with the advantage of the ocean breezes to temper the summer. The city itself is crowded, filthy, and unattractive, but the countryside is quite lovely; and the further you go from the main highways, the more beautiful the mountains, cleaner and neater the villages, and friendlier the people. There is no doubt that contact with large bodies of troops, whether conquerors or "liberators", is a very demoralizing force on the local population.

Our quarters are by far the best in Korea, since they were built before the war for the families of members of the U.S. military mission here. The only thing we lack is water, which runs for only an hour or two morning and evening.

Medically, the place is a museum, not only because of the prevalence of common and exotic parasites, but also for other rare conditions, such as Buergher's disease in young, non-smoking males. And almost as interesting are the various accepted forms of therapy. For ascaris, for instance, santonin is still the drug of choice amongst the more enlightened clinicians, but others put a Levin tube in the stomach and inject two liters of oxygen—no more, no less. (I don't know whether it is the resultant gurgling or the patient's moans that makes the worm lose its grip.) And lay people prefer to treat them with a tumbler of gasoline, taken neat. There are also many Chinese herbal preparations, as complicated and aromatic as they are toxic, and Chinese "treatments" which consist of needling the site of pain, with all the foreseeable complications.

Military medicine, on the other hand, especially at the dispensary level, is usually rather dull, given the basic good health and age of the troops and the unfortunately enormous secondary gains they derive from minor illnesses, since it is the only generally acceptable way of avoiding onerous duties. Fortunately, we also have a 50-bed ward at the Swedish Red Cross Hospital, where we can place our richer patients, and rounds there and the handling of some of the more troublesome emotional problems add considerable interest to the daily routine.

Pusan is lucky in having several excellent hospitals run by foreigners (mostly missionaries, plus Red Cross people) and I have availed myself of these opportunities by working in two of them and making weekly rounds in a third. I am very fortunate in having a very bright North Korean medical student as interpreter, assistant, and traveling companion, and, as you can imagine, his presence opens up any number of vistas that would otherwise not be accessible to me.

Please remember me to any of my friends you might see.

THE NEWS

No. 158 Boston, Mass. July and August 1956

ORTHOPEDIC SERVICE

The invitation of the Editor of THE NEWS to write an article on the activities of the Orthopedic Service is always welcomed, for it gives us the opportunity of utilizing that marvelous research instrument, the scanning retrospectoscope. Our last reported analysis appeared in THE NEWS in March 1955. We have examined several service serum samples withdrawn at intervals since that date. Analysis of these samples indicates that there is almost no fat in our blood stream. This result, of course, is not unexpected, for our financial diet is definitely on the lean side. There are occasional traces of sugar (compliments and kudos). We would be unhappy if these quick-burning fuels were not present. When treated with the insulin of modesty and nonchalance, they seem to add to our energy output.

These notes, however, concern themselves primarily with the protein fraction and the hemoglobin which carries oxygen to our tissues. Within the limits of a short article we can comment on only a few of these interesting fractions.

The Poliomyelitis Story (Chapter 2)

The emergency aspects of this story were told in the November issue of THE NEWS. The acute phase of the epidemic is now over and the survivors are in the convalescent phase. These patients may be classified in three main groups—nonparalytic, paralytic not requiring respiratory assistance, and paralytic requiring respiratory assistance. The first group are the fortunate ones. They have had the acute disease and have recovered with so little residual weakness that their motor functions are essentially normal. These patients bear no permanent scars. The adult patients in this group have been discharged. The children will require annual check-up examinations during their growing period to make certain that minor muscle weakness does not produce skeletal deformities during their growing phase. Foot deformity, knock-knee, scoliosis may occur several years after a child has apparently completely recovered from an attack of poliomyelitis. The second group of polio patients—those with muscle involvement, but who do not require respiratory assistance (about 180 in number)—have been discharged to their homes and are returning at regular intervals to the Polio Clinic. The Clinic is held all day on Thursdays and is attended by four members of the Orthopedic Visiting Staff (Drs. Reidy, Broderick, Lowell, and DeLorme). The team includes a social service worker, physical therapist, occupational therapist, brace maker, and secretary, all of whom play an essential role in helping the patient toward the goal of complete rehabilitation. Paralytic polio is a subtractive disease and motor cells once killed cannot function again, but through hypertrophy of functioning muscle units and by substitution of functioning units for nonfunctioning ones, disabilities may be overcome to a surprising degree. It will not be long before some of these patients will be ready for operative assistance in the form of muscle transplants, joint stabilizations, etc. The Orthopedic Workshop under the capable direction of Bill Murphy, is working at top speed, turning out apparatus of all types which act as external assistance for weakened trunks and extremities. Each polio patient who returns to the Clinic is assigned to one of the Visiting men as his patient. Thus, there is assured the continuity of care and the certainty of personal interest which makes for good patient care.

At the present time there remain on White 9 twenty-four patients who have had severe involvement of the muscles of respiration and who still require assistance in the vital function of breathing. Some of these patients are out of the respirator except for one or two hours per day and, as strength slowly returns to their weak respiratory muscles, their vital capacity increases to the point where the respirator is no longer needed. The struggle toward the goal of freedom from breathing assistance is a slow and difficult one. It requires skilled care in enormous amounts but there is an air of cheerfulness, courage, and optimism on this ward which is scarcely equalled elsewhere in the Hospital. When it became obvious that the facilities outside of the Massachusetts General Hospital were inadequate to care for our respiratory patients, the Hospital administration decided to keep the respirator ward open so long as there is need for it. The decision is in harmony with the traditions of the M.G.H.

In our last article in THE NEWS we mentioned the opening of the Rehabilitation Ward on White 8 for the care of paraplegics, amputees, and others needing prolonged and specialized rehabilitation services. During the polio epidemic this ward was used exclusively for severely paralyzed polio patients not requiring respirator care. As these patients are being discharged to their homes, the ward is resuming its original function and is now admitting paraplegic patients, amputees, etc., in addition to polio patients.

It is a pleasure to announce that the chapter manuscripts and illustrations for the new edition of the *M.G.H. Fracture Book* are in their final form and will within the next few weeks be on their way to the publisher. Dr. Cave has proved himself to be an able and tireless editor who knows how to keep the pressure on dilatory co-authors.

A new and interesting development which will undoubtedly affect the Orthopedic Service, as it will all clinical services at the M.G.H., has taken place during the past year. The outer shell of the new building on Charles Street is complete and occupancy is expected by the end of the year. Five floors of this building will be used temporarily for private offices of the Visiting Staff of the M.G.H. Eventually, we hope to have a new building for doctors' offices, and these floors will then be available for patients. Our Visiting Staff has indicated its desire to have their offices located on one floor of the new building and we hope that on this same floor there can be provided x-ray diagnostic facilities, a plaster room, and such other equipment and facilities as will make for efficient care of the ambulatory orthopedic patient. We also hope that these offices will be immediately adjacent to the Orthopedic floor in Baker. With the operating rooms, the Orthopedic Ward, and the Ambulatory Clinic only a short distance away, the efficiency of our Service should be raised appreciably and the time lost bucking traffic between the Hospital and an up-town office will, we hope, be eliminated.

Research

The American Foundation has recently published a most interesting two-volume book, *Medical research: A mid-century survey,* in which it is pointed out that fundamental medical research uses the tools, techniques, and knowledge of chemistry, physics (atomic energy), and mathematics. Fundamental research in orthopedics is no exception to this rule. Fortunately, research in the field of chemistry (metabolism) of the skeletal system at the M.G.H. has gone forward for many years under the brilliant leadership of Drs. Fuller Albright and Walter Bauer. It would be wasteful duplication of effort for the Orthopedic Service to set up laboratory facilities in this field, but the problems of the locomotor system are to a large extent biomechanical and involve fundamental knowledge in physics and mathematics. With M.I.T. just across the river, there are available intellectual and physical resources of the first order which can and should be brought to bear on the solution of orthopedic problems. Professor Hansen of the Department of Structural Engineering at M.I.T. has worked with us for the past several years on a voluntary and informal basis. Supported by a grant from the Donner Foundation, a graduate student in his department, Mr. Yorra, has been working with Dr. Thornton Brown in a study of that complex mechanism, the lumbosacral spine. A report of their investigations which will soon be forthcoming contains original observations of fundamental importance. One of Professor Hansen's students, Mr. Rothstein, has written his senior thesis on biomechanics of the foot and ankle. This work was done under the supervision of Drs. Joplin, Brown, and Glimcher. Dr. Glimcher, who completed his senior residency on the Orthopedic Service July 1, is spending the coming year with Professor Francis O. Schmitt as a research associate in the Department of Biology at M.I.T. If Dr. Glimcher survives this year's intensive work and rarified atmosphere, he expects to return to the M.G.H. to begin an investigative career aimed at intensive study of our old friend, Wolff's law, as it relates to the form and function of the locomotor system, at gross and (ultra) microscopic levels.

The load of clinical patients, ambulatory and in the house, continues to increase slowly but steadily. There has, in particular, been a marked increase in numbers of fracture patients. This increase is very welcome. It is contributed to by the fact that the Emergency Ward is fully staffed 24 hours a day and, in addition, the Boston Police Department is bringing victims of accidents in our neighborhood to the M.G.H. instead of taking them across the city to the Boston City Hospital as was the custom in previous years.

Teaching of Harvard Medical School students, residents, and graduate students continues at its usual active level with unabated enthusiasm. During the past year we have had graduate students from Indonesia, Nationalist China (Taiwan), Mexico, Korea, Cuba, South America, Iraq, as well as the United States.

These rambling notes will assure the reader that many changes are occurring on the Orthopedic Service at the M.G.H. but, fortunately, the more it changes the more it remains the same.

Joseph S. Barr, M.D.,
Chief of Orthopedic Service

* * *

Dr. Edward F. Bland has been elected President of the Massachusetts Heart Association.

Dr. Mary A. B. Brazier has been elected a Fellow of the American Academy of Arts and Sciences.

At the Annual Meeting of the American Association of Plastic Surgeons held in Toronto in May, Dr. Bradford Cannon was elected Vice-President of the Association. He has completed a term of 8 years as a member of the American Board of Plastic Surgery and during that term was Secretary-Treasurer of the Board from 1950 to 1955.

Dr. Dean A. Clark was named President-elect of the Massachusetts Hospital Association at its annual meeting in Boston on May 10.

In addition to other honors, Dr. Stanley Cobb has received three medals during the past year: the Hamilton Award of the American Psychopathological Association "for distinguished contribution to Psychopathology", in June 1955; the Albert Einstein Commemorative Award from Yeshiva University in behalf of the Albert Einstein College of Medicine "for achievement in Medicine", in April 1956; and the Kober Medal of the Association of American Physicians "for research in Scientific Medicine", in May 1956.

The honor of being the George Winslow Holmes Lecturer this year was awarded to Dr. Laurence L. Robbins. This lectureship was established in 1945 by the New England Roentgen Ray Society in honor of Dr. George Winslow Holmes—he being the first lecturer. This year the Society selected as lecturer one of his students, Dr. Robbins, who also succeeded Dr. Holmes as Chief of the Department of Radiology at Massachusetts General Hospital.

Dr. Robbins is the twelfth person to be honored with this lectureship. The title of his address was "The radiologist faces automation". It was given on May 18 at the Annual Meeting of the New England Roentgen Ray Society. A sterling silver Paul Revere pitcher was presented to Dr. Robbins.

Dr. LeRoy A. Schall, Chief of the Otolaryngology Service at Massachusetts Eye and Ear Infirmary, has been elected President of the American Laryngological Association.

The Board of Trustees, at their meeting on May 11, voted to appoint:

Dr. Egbert Mueller as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. Ernst Navratil of Graz, Austria, as Visiting Surgeon pro tempore, assigned to Gynecology, for one week in June.

At their meetings on March 28, during May, and on June 6, the General Executive Committee voted:

To promote:

Dr. Mitchell T. Rabkin from the position of Intern to that of Assistant Resident in Medicine, beginning July 1.

To reappoint:

Dr. Mahlon B. Hoagland as Associate Biochemist (Medicine) for three years, beginning September 1;
Dr. Robert B. Loftfield as Associate Biochemist (Medicine) for three years, beginning June 1.

To extend the appointment of:

Dr. Carol Meyers as Graduate Student Assistant in Orthopedic Surgery from May 12 through June 12.

To appoint:

Dr. Alan C. Aisenberg as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. John F. Bertles as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Alan S. Cohen as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. Nicholas J. Fiumara as Clinical Assistant in Dermatology, effective as of May 1;
Dr. Soren Jorgensen as Senior Fellow in Anesthesia, for the period of six months, beginning on or about July 1;
Dr. Richard A. Joske as Clinical and Research Fellow in Medicine, beginning September 1;
Dr. Edmund Klein as Clinical and Research Fellow in Dermatology for one year, beginning July 1;
Dr. Bernhard Laukenmann as Clinical Fellow in Anesthesia for one year, beginning September 1;
Dr. Franz J. Lucas as Fellow in Anesthesia for one year, beginning July 1;
Dr. Josip Matovinovic as Clinical and Research Fellow in Medicine, to become effective at the time of his arrival in this country;
William S. Quigley, B.S. as Research Fellow in Physics (Medicine), effective as of April 30;
Dr. Francoise J. Robert as Research Fellow in Neuropathology for one year, beginning July 1;
Dr. Fernando Rosas-Peña as Research Fellow in Neurology, for the period May 21 through September 21;
Commander Robert W. Spicher, M.D. as Clinical Fellow in Radiology for one year, beginning July 1, 1957;
Samuel B. Weiss, Ph.D. as Research Fellow in Biochemistry, beginning September 1.

About two hundred fifty friends from McLean Hospital, the Massachusetts General, and the Board of Trustees gathered at McLean Hospital on June 8 at an informal buffet to honor Dr. W. Franklin Wood who retired as Director of McLean on June 30. Mr. Ralph Lowell, Chairman of the McLean Committee, presented Dr. and Mrs. Wood with gifts and gave a brief but impressive talk on Dr. Wood's accomplishments while he was Director at McLean. Dr. Wood responded in his usual unique and pleasing manner, thanking the McLean family for their support and help during his twenty-four years of service. He, of course, attributed the success he has had to the loyalty and friendship of the employees of the Hospital.

Dr. Wood has been Director at McLean during a period of great changes in hospital methods. Under his supervision, patient care has been improved to a high level; there are now double the number of admissions and many more acute cases. With modern treatment methods many patients get well in less time. The departmental organization of the Hospital has been much strengthened in recent years. The Nurses Training School has been improved through better organization and teaching methods. There have been advances in the training of residents in psychiatry, and in research. In addition, the Hospital has done better financially for the patient than most hospitals have been able to do. There has almost always been a balanced budget, despite relatively low increases in patients' rates. This has been achieved without much outside financial support.

Dr. Wood has greatly strengthened the friendly relationship between the citizens of the Town of Belmont and the Hospital. He was always alert to the Hospital's place in the community. He believes that the Hospital is a part of the Town, that the Town benefits by its being there and by the extension of its Community Service. He has accomplished all this through hundreds of personal contacts and associations. Dr. Wood will be remembered at McLean and by the people whom the Hospital has served not only for the excellent standards and efficiency of his administration, but also for the high degree of personal interest which went into all of his contacts. He believes that in the care of nervous illness the Hospital should contribute in a very personal way and that its administrator should be primarily a physician.

Dr. Wood was a member of Base Hospital 44 and served abroad in World War I. Before coming to McLean he had been Assistant Director of the Massachusetts General Hospital, Assistant Superintendent and Acting Superintendent at Danvers State Hospital, Assistant to the Commissioner in the Massachusetts Department of Mental Health, Chief Executive Officer of the Boston Psychopathic Hospital, Assistant Superintendent of Monson State Hospital, and Assistant Superintendent of the Massachusetts Memorial Hospitals. He is a graduate of New York Medical College and Flower Hospital, and Tufts University Medical School.

In addition to his position as Director of McLean Hospital, Dr. Wood has been President and Secretary of the Massachusetts Hospital Association, President and Secretary of the New England Hospital Assembly, Regent of the American College of Hospital Administrators, and President of the New England Superintendents Club. He also is a member of the American Medical Association, the New England Psychiatric Association, the Massachusetts Medical Society, the Massachusetts Psychiatric Association, and a Diplomate of the American Board of Psychiatry and Neurology. He is Past-President of the Boston Rotary Club, a member of the Belmont Medical Society, Director of the Waverley Cooperative Bank, a Trustee of the Belmont Savings Bank, and has served for many years on the Warrant Committee of the Town.

Dr. Wood is now Psychiatric Consultant at the Massachusetts Department of Mental Health, where he interviews patients and their relatives. He has been appointed School Physician of the Belmont Schools, and is a Psychiatric Consultant at the Leslie Junior College in Cambridge. He has bought a little house in Belmont, at 396 Marsh Street, and will continue his interest in professional and civic activities of the Town.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Gravenstein, J. S., Smith, G. M., Sphire, R. D., Isaacs, J. P., and Beecher, H. K.
Dihydrocodeine: Further development in measurement of analgesic power and appraisal of psychologic side effects of analgesic agents.
New England J. Med. 254:877-885.

Knapp, M. R., and Beecher, H. K.
Postanesthetic nausea, vomiting, and retching: Evaluation of the antiemetic drugs dimenhydrinate (Dramamine), chlorpromazine, and pentobarbital sodium.
J.A.M.A. 160:376-385.

General Surgery

Dexter, C. J.
Benign enlargement of the male breast.
New England J. Med. 254:996-997.

Laboratory Science

Herbst, F. S. M., Lever, W. F., and Waddell, W. R.
Effects of intravenously administered fat on the serum lipoproteins.
Science 123:843-844.

Jeanloz, R. W.
The chemistry of mucopolysaccharides.
In Proceedings of the Third International Congress of Biochemistry, Brussels, 1955, C. Liébecq, Editor, New York, N. Y., Academic Press Inc., pp. 65-72, 1956.

Jeanloz, R. W., and Trémège, M.
Color reaction of N-acetylamino sugar derivatives with p-dimethylaminobenzaldehyde.
Federation Proc. 15:282.

Neurophysiology

Brazier, M. A. B., and Barlow, J. S.
Some applications of correlation analysis to clinical problems in electroencephalography.
EEG & Clin. Neurophysiol. 8:325-331.

Physical Medicine

Watkins, A. L.
Current trends in Physical Medicine and Rehabilitation.
Arch. Phys. Med. & Rehabil. 37:221-224.

Radiology

Wang, C. C., and Robbins, L. L.
Amyloid disease: Its roentgen manifestations.
Radiology 66:489-501.

Miscellaneous

Garland, J.
Clarity in medical writing.
Mississippi Valley M. J. 78:38-43.

Garland, J.
Development of editorial material.
Northwest Med. 55:403-405.

Garland, J.
Some accessory factors in medical education.
Harvard Med. Alum. Bull., April: 7-9.

Books

Rackemann, F. M.
The inquisitive physician: The life and times of George Richards Minot, M.D.
Cambridge, Massachusetts, Harvard University Press.

PULMONARY CLINIC

In 1949 THE NEWS published a write-up of the Pulmonary Clinic, then in its twenty-fourth year. I joined the staff of the clinic in 1931, six years after it had been established, and feel accordingly that I have some perspective with which to appraise its activities. It seems to me that we have been through two periods or phases of emphasis thus far and that a third period is upon us. These phases might be called: the time of the perfection of thoracic surgery, the antibiotic era, and the physiologic or pulmonary function period. These broad generalizations require amplification and qualification. Throughout the years our patients have presented problems in four main areas: tuberculosis, nonspecific infections such as bronchiectasis and lung abscess, fibrosis and emphysema, and lung cancer. Obviously, no one pattern of therapy is applicable to all these processes.

The years preceding the introduction of antibiotics were those in which vast progress was made in thoracic surgery. In tuberculosis, collapse therapy — either medical collapse by artificial pneumothorax, or surgical by means of phrenic nerve interruption and thoracoplasty—constituted great advances in management of the disease. Lobectomy, with or without sinus surgery, prolonged the useful life of the victims of bronchiectasis. External drainage of putrid lung abscesses was a messy business, involving, as it did, draining chest wall wounds, but until lobectomy for chronic abscess became possible, it served its purpose.

With the introduction of antibiotics the pattern of chronic infection changed. For the first time there was an effective therapeutic tool for tuberculosis. Bronchial obstruction and persistent atelectasis —the sequellae of whooping cough and pneumonias — could be attacked by the bronchoscope and by medical agents, sinusitis did not progress to suppuration, and we saw less and less new bronchiectasis. By the use of the same tools lung abscess has become a medical disease and a rare one at that. Not only have we seen a marked decline in the incidence of new cases of chronic suppurative disease but, also, with control of infection playing at least a part, we have an ever-increasing population of older people with the degenerative diseases of age. These individuals with chronic fibrosis and emphysema are particularly vulnerable to intercurrent respiratory infections. By means of winter-long prophylactic use of sulfonamides or antibiotics the incidence of disabling infections and pneumonia has been sharply cut in this population. The advances in control of tuberculosis throughout the country and in management of acute respiratory infections has been reflected in the patients coming to the clinic. We see less and less tuberculosis, bronchiectasis, and abscess, and more and more fibrosis, emphysema, and neoplasm.

Before leaving the subject of infection, however, we should mention here the recent discovery of lack of gamma globulin in certain persons with uncontrollable propensity to infection. For the last two years we have been conducting a survey of our patients for this defect and find that, despite the increasing number of reported cases, it is a rare condition in adults.

This brings us to a consideration of the future of the clinic. The main emphasis of the pulmonary physiologists has been on measurements of lung function. In recent years a voluminous literature on this subject has appeared. There has been serious difference of opinion as to whether utilization of these techniques was making a real contribution to the understanding and, consequently, to the management of lung disease or not. There has been increasing demand, particularly among the younger members of the Hospital staff, to have facilities for such measurements of function available. It now seems probable that within a couple of years such a laboratory will be set up. We hope that it will prove as valuable as the techniques of cardiac catheterization have proved to be in their field.

I have omitted consideration of the field of cancer thus far. This disease continues to be seen with great frequency. We are grateful to the radiologists, endoscopists, and cytologists for their parts in clarification of diagnosis. The treatment remains all too often unsatisfactory. Direct surgical attack on small peripheral lesions disclosed by x-ray is establishing the diagnosis earlier in some cases. This is in line with the trend to lung biopsy in instances of various conditions of obscure nature. The freer use of the direct approach for purposes of diagnosis is a reflection of the high degree of safety of thoracic surgery in the hands of our staff.

The work of the out-patient clinic and of the weekly Tuesday morning rounds, which concern themselves chiefly with in-patients, cannot be entirely separated. Both are conducted jointly by the medical and surgical staff. At our rounds we can count also on the participation of a radiologist to discuss the x-rays and to give advice, particularly when radiation therapy is under consideration, and of a pathologist to demonstrate the tissues removed at operation. In the out-patient clinic a new schedule was instituted this year. We now meet on the second and fourth Wednesdays, only. Although the number of patients with neoplasm has increased to a point where many of them are seen in the tumor clinic quarters on White 2, adjacent to x-ray therapy, the reduction in numbers of persons coming with tuberculosis and other infections has continued to a point which has made it possible to give adequate patient care with reduced clinic sessions.

Helen S. Pittman, M.D.,
Associate Physician

* * *

On March 24, *Saturday Review* inaugurated its new monthly "Science & Humanity" section. John Lear, *SR*'s Science Editor, wrote a piece on blood fractionation for that issue, entitled "Human drug factories", in which he outlined the amazing work being done by Dr. Joseph Smolens and one of our alumni—Dr. Joseph Stokes, Jr. (*W.M.* 1921). The article reads, in part:

> Drs. Smolens and Stokes began with the knowledge that, during convalescence the blood of a contagious disease victim carries a high concentration of antibodies, or gamma globulins. That's why the patient is getting well—because the antibodies are in there, in large numbers, fighting the invasion. And this convalescent phenomenon can be produced artificially by injecting a vaccine. So the Philadelphia experiment was done with twenty-three men, four of them naturally hyperimmune to whooping cough and nineteen vaccinated against whooping cough and mumps. There wasn't too much danger in the deliberate vaccinations, for the men were husky members of the Philadelphia Park Police, between twenty-six and thirty-five years old.
>
> Once every two weeks each of the twenty-three subjects of the experiment gave blood. Into the splitting machine it went, and out came two major blood fractions: (1) the plasma, of which the gamma globulins are part, and (2) the red cells, white cells and other formed elements of the blood. Since the two doctors wanted only the gamma globulins, they promptly poured the rest of the blood back into the veins of the twenty-three men.
>
> At the time this work was formally reported, at a Protein Foundation symposium in January 1956, none of the experimental human drug factories had shown any ill effects after giving seventeen successive batches of gamma globulin. Their blood pressures, pulse rates, red and white cell counts, and other customary indices of sound health remained undisturbed. The average time for a gamma globulin runoff was twenty-two minutes, including nine minutes to draw the blood and ten minutes to pour the unwanted fractions back again.
>
> The significance of this Philadelphia experiment could be enormous. For example, after more experience has been gained with polio vaccine . . . it may be possible to hyperimmunize a relative handful of people and from them obtain protection for thousands. It has been estimated by Dr. Stokes that only 2,000 regular donors would be required to fill immunization needs of various kinds now supplied by 4,000,000 conventional once-a-year blood transfusions.

Of course, we immediately wrote to Dr. Stokes, asking him for a more detailed write-up on his work for THE NEWS. Dr. Stokes replied: "In many ways . . . the *Saturday Review* article has created excitement in other quarters, and *Life* of April 23 has a two-page 'spread' on the same work. . . . Perhaps this is enough publicity on the matter for the time being."

Undauntedly, we persisted, and finally succeeded in getting the following from Dr. Stokes:

> Plasmapheresis is the process in which whole blood, obtained from a donor, is separated into plasma and red blood cells, the red blood cells being returned to the donor and only the plasma retained.
>
> An ADL Cohn Blood Fractionator has been utilized at the Children's Hospital of Philadelphia for biweekly plasmaphereses of 23 donors. With this equipment the blood is continuously separated into red blood cells and plasma, and the red blood cells are returned immediately to the donor. The phlebotomy consists of 1 pint of blood with about 200 ml. of plasma retained, the remaining 300 ml. volume being returned to the donor. Twenty-six plasmaphereses have been carried out on each of the individuals over a period of 52 weeks.
>
> The following tests were run at each plasmapheresis: red blood cell, white blood cell differential and platelet counts, hemoglobin, hematocrit, sedimentation rate and prothrombin time. Paper electrophoretic pattern and nitrogen contents were determined for each plasma sample. Pertussis, mumps, and streptolysin antibodies were titrated in each plasma, since some of the donors were immunized versus either mumps or pertussis antigens. A non-immunized control group was also included.
>
> The results of the first year's study showed that the various components of the blood remained normal. This means that this technique is safe. The time required for the entire procedure was about 20 minutes, which means that this technique is practicable. The antibodies resulting from the administration of antigens have remained at peak levels throughout the course of this study, i.e., 40 weeks following the final injection of antigen, even though almost two times the original plasma volume was removed from each donor (5200 ml. plasma). If the normal cellular turnover is taken into consideration, it is obvious that the technique of repeated plasmapheresis of the same donors stimulates the formation of antibodies.

ALLERGY IN EUROPE

February 1956

Ever since the European Congress of Allergy, held in France in 1950, and the organization meeting of the International Association of Allergology in Zurich in 1951, I had wanted to see again those friendly gentlemen who had been so very cordial to me. As time passed and correspondence increased, it was clear that I would be welcome in Europe, and it seemed likely that I would learn about the problems of hay fever, asthma, and eczema if I went over. When an enthusiastic letter from Dr. Willem Quarles van Ufford in Utrecht included a schedule of daily clinic conferences and meetings in various parts of Holland, I bought my tickets without further procrastination.

Sailing on the *Queen Elizabeth* is a luxurious vacation, especially in February when the ship has only about one-half of its complement of passengers.

In London there is one allergy clinic which compares with ours. At St. Mary's Hospital, where Dr. Louis Noon and his successor, Dr. John Freeman, started in 1911 to treat hay fever by injections of pollen extract, the allergy clinic is run now by Dr. A. W. Frankland. To see great numbers of patients (over a hundred on most days) and four doctors struggling with them was a familiar view. It is not surprising that it was hard to find out, "What is the real matter with this patient, anyway?"

Upstairs in the laboratory, the impression was much better. Here was Dr. Ruth Augustin, a pleasant, intelligent lady who could immunize rabbits against pollen by giving multiple injections into skin, muscle, and peritoneum, and who could demonstrate the antibody by the agar diffusion techniques of Oudin and of Ouchterlony. Some of her pollen extracts produced a single peak in the Tiselius apparatus.

Other doctors in London are interested in asthma, but their work is private—in their offices on a consultation basis quite separate from the general plan of socialized medicine. Their approach was much more fundamental. I was delighted to have talks with Drs. Bruce Pearson, David Harley, and C. J. C. Britton.

Dr. R. J. S. MacDowall, Professor of Physiology at King's College, who was in America last fall, is still working on the effect of the sodium concentration on the reaction of smooth muscle to histamine and to the specific antigen. Intracellular sodium may be important in asthma. Incidentally, he showed me the room in which Pasteur, Koch, and Lister came together about 1870 to see Koch's agar plate cultures of bacteria.

Four weeks later, before the *Queen Mary* sailed on March 7, I had an extra day in England, and I spent it with Dr. David E. Williams in Cardiff, Wales. To study pollen and molds he has a fancy gadget which draws air through a metal slit, so that the dust in it impinges on a greased slide which moves by clockwork past the slit. He can show that pollen is produced more in the morning, mold spores in the afternoon. Charts show the incidence of asthma in Britain from month to month as well as from year to year. Unfortunately, he does not distinguish those cases whose asthma begins before age 30 and depends upon allergy ("extrinsic") from those others who begin after age 40 because of some disturbance which they carry within themselves ("intrinsic"). He and the pathologist at the Welch National Institute of Medicine, Professor Jethroe Gough, showed me some remarkable preparations of coal miner's lung with large black areas of solid coal imbedded in the pulmonary tissue. No wonder the patients had wheezed.

It takes only one and a half hours to fly from England to Holland. Dr. Willem Quarles van Ufford met me at the airport in Amsterdam and drove me to Utrecht, about twenty-five miles away. In my hotel room I found flowers, a bottle of Holland gin, a pretty little porcelain jar filled with cordial, and a collection of the Doctor's reprints. What a warm, friendly greeting! During a busy week, "Dr. Quarles" drove me in his Volkswagen from Utrecht all over Holland—to Rotterdam, Gouda, Delft, The Hague, and Leiden—none of them much over twenty-five miles from Utrecht. I took part in five meetings, discussing the problems of allergy and asthma. The arrangement of these meetings and the business of transporting me to and fro were appreciated greatly. It was cold in Holland in February—about 15° F. on most mornings. Everybody, except us, was skating on the canals until a fall of snow spoiled the fun.

There is much interest in fungi (molds) in Holland. A part of this stems from Professor Johanna Westerdijk, a charming, elderly lady who has developed the Centraalbureau voor Schimmelcultures. In the little country town of Baarn, not far from Utrecht, she has taken over a good-sized house and converted it into an extensive laboratory. Molds come to her for identification from all over the world—even from Harvard. Here are thousands, maybe hundreds of thousands, of mold cultures. "They are my children," she says, "and, like children, they are apt to be fussy about their food." She has ninety-five different media for the molds to grow on. The conventional Sabouraud's medium is good, but slices of potato or carrot on the leaves or stems from many different trees and shrubs are usually better—all depending on the natural habitat of the particular mold. "Sunlight? Why not?" she says. "Don't molds grow outdoors on leaves in the sun?" I asked about contaminations in the laboratory. "We have no trouble," she replied. "Every morning and night we wash the desks and floors and spray the shelves with formalin six percent in water. The fumes pass off in a few minutes when we open the windows." Her enthusiasm was high—it was a privilege to meet her.

In treating asthma, attention is paid to the type of mold predominant in the patient's environment, a principle which sounds obvious but is not simple in practice since mold cultures show a mixed growth—often very mixed.

It is easy to talk about the diseases of allergy—the diagnosis and treatment of the exciting causes and the theories about the basic mechanism—to try to explain "How did the patient get that way?" In contrast, the application of the talk is not easy. When several patients were brought into the conference room, with little if any work-up and with the request to "Please tell us how you would treat this patient", it was necessary to explain that a satisfactory study starting from scratch would require about two hours of time.

In Leiden, Professor J. Mulder studies eosinophils in sputum by immersing a washed portion in a watery solution of eosin and formalin and then looking at the wet preparation. Professor Andries Querido had studied at the M.G.H. under Dr. Means. It was good to see him again. He heads a group which is working on hormones and finds, among other things, that the 17-ketosteroids in the blood rise and fall with great rapidity within a few minutes in response to stress of different kinds—a response which may not be reflected in the twenty-four- or even in the twelve-hour urine.

In Utrecht, Professor A. A. J. Van Egmond, Chief of the Nose and Throat Department, was interested in the vestibular apparatus. He had a closed octagonal box, or cage, about six feet in diameter, which could be revolved at varying speeds. To sit still in the revolving cage caused no sensation, but if the sitter tipped his head even a little, he felt a pang of acute dizziness. The Professor had other gadgets, too, but they were less impressive. In Paris, the high spot was the laboratory of Professor Bernard L. Halpern at the Hôpital Broussais. Most of his work is done in a big room, with desks under the windows on both sides. Here was his chief assistant, Dr. J. P. Duesberg. There were also four girl technicians, all very competent, and two men helpers. Dr. Halpern was one of the first to synthesize an antihistamine drug. Now he is working on "histamine liberators"—a group of substances with large molecular weight which can produce the symptom of histamine shock. He demonstrated severe generalized itching, with swelling of the eyes and nose, in a dog following an intravenous injection. To see three different technicians working with three different muscle preparations, determining the concentration of histamine in many, was impressive. At another table, Dr. Duesberg was taking moving pictures through a bronchoscope, to make a graphic record of the changes produced by vagus stimulation or by the injection of a histamine liberator. His technique was easy and simple.

My attempt to read a paper "en Français" to La Société Française d'Allergie was not good. My pronunciation was atrocious, and Professor Pasteur Vallery-Radot said to me, "When you talk to the students tomorrow, you had better talk in English." When — I — talked — very — slowly — they — seemed — to — understand — and — gave — me — a — hand.

The house in which Pasteur lived during his later years was built for him as a part of l'Institute Pasteur. It is an impressive place, full of interesting reminders of the work and the life of an extraordinary man. Dr. Grabar, the medical director, seemed to be pleased to show it to me. In this modern day, l'Institute Pasteur prepares serum and vaccines for all of France and studies their activities in new modern laboratories.

To go from Paris to Copenhagen takes nearly twenty-four hours by train and ferry, but less than two hours by airplane. In Copenhagen, another devoted friend, Dr. Egon Bruun, and his charming wife took charge of me and showed me everything of interest during my week's stay.

At lunches and dinners I met many distinguished people and enjoyed the visit immensely.

Copenhagen has two large general hospitals—the Bispebjaerg, or Bishops Hospital, supported by the City, and the Rigshospital, the University hospital, supported by the State. Professor Einar Meulengracht is Chief of Medicine in the former, Professor Eggert Moeller is Chief of Medicine in the latter. Both have students in good laboratories in modern buildings.

Dr. Bruun's clinic for the study of allergy at the University hospital was well organized. Dr. Bruun and his assistants are working on the problems of house-dust allergy in asthma and of drug allergy in angio-edema. Dr. Wilkin-Jenson takes special care of the children. The doctors and nurses were trying to work effectively, but they had too many patients. All clinical allergy is like that!

On another day I met Dr. Kaj Linderstrom-Lang in the Carlsberg Laboratories. Back in 1876, a Mr. Jacobsen had made his pile from the Carlsberg Brewery and set up a Foundation Trust, the interest to be applied to the study of the malt fermentation process. But very fortunately he added a clause that the income could also be used for researches in general physiology. Dr. Linderstrom-Lang is working on the structure of proteins. In the Director's Room of the laboratory is a handsome portrait of Kjeldahl. The flask on his desk has a purple color because he used permanganate to oxidize the nitrogen-containing material. Another portrait was of Sorensen, who first conceived of pH. The Carlsberg Foundation is an important asset to Denmark.

I wanted to see Professor August Krogh's old laboratory because so many friends had worked there. Francis W. Peabody, Cecil K. Drinker and his wife, James Howard Means, and Eugene M. Landis had all been stimulated by the master of capillary physiology. I was delighted to see the photographs of my friends on the wall. The old building is now the Institute for Zoophysiology, also known as the Rockefeller Institute because of its American support. Professor Brandt Rehberg is in charge. His assistant, Dr. Zeuthen, is working on respiration—on the metabolism of hibernating frogs. Both gentlemen received me cordially.

As in Holland, so in Denmark. I saw the men and learned something of their work. Whereas a week's stay in one place is long enough to obtain an over-all impression, it is not long enough to grasp the details of many complex problems. To "keep one's friendships in repair" is always important, and my trip did that very well.

I had a wonderful experience, but I was glad to have five days of peace and quiet on the *Queen Mary* coming home. Do we in America devote ourselves to the instruction and entertainment of doctors from Europe as my friends over there devoted themselves to me? The question disturbs me a good deal.

Francis M. Rackemann, M.D.,
Member of Board of Consultation

Feby 23 1827

CLINICAL RESEARCH AT THE RETINA FOUNDATION

While a general description of the Retina Foundation's activities appeared in THE NEWS of March 1955, a somewhat more detailed and up-to-date report on its clinical research activities may be of interest at the present time.

The current program of clinical research received its impetus from the development by our Clinical Unit of a method of ophthalmoscopy for the examination of the extreme fundus periphery. This method consists of using an indirect stereoscopic ophthalmoscope which is equipped with a powerful illumination system and mounted on a headband. The peripheral areas of the fundus oculi are brought into view by indenting the globe with a small instrument called a scleral depressor.

This method of ophthalmoscopy has made possible considerable improvement in the diagnosis of conditions predominantly localized in the anterior portion of the fundus, such as cases of retinal detachment, peripheral uveitis, retrolental fibroplasia, and certain cases of intraocular tumors, vascular conditions of the retina, contusions of the globe, and intraocular foreign bodies. The method was tested extensively at the Retina Service of the Massachusetts Eye and Ear Infirmary, which is a special clinic established for the examination and treatment of patients affected with retinal detachment. Its usefulness perhaps may be measured by the fact that the number of new patients, both private and clinical, seen by the staff of this Service, has increased from 366 in 1948 to 1,044 in 1955. Indirect ophthalmoscopy with scleral indentation has become indispensable for the detection of retinal breaks in cases of detachment of the retina. Because of this fact, improvement in the diagnosis and treatment of retinal detachment is an essential part of our clinical research program. In this area, also, comparative figures are of interest. The Retina Service staff either performed or directed 165 operations for retinal detachment in 1948, and 719 operations in 1955.

In 1952, extensive research was begun in order to improve surgical methods used for retinal detachment. Several types of scleral buckling were developed which have almost completely replaced the method of simple diathermy. The essential advantage of scleral buckling is that the portion of the choroid, first treated with diathermy, is brought into contact with the detached retina at the time of surgery. This is accomplished by indenting the sclera with a piece of polyethylene tubing. The tubing is placed under mattress sutures, and buckles the sclera when the sutures are tied. The height of the buckle may be varied according to the particular case; when a very high and permanent buckle is desired, a tube of polyethylene is placed all around the globe, both ends being attached to each other like a belt around one's waist. As a result of these changes in surgical technique, the pre- and post-operative routine was altered as follows:

	1947	1955
STAY IN BED		
Before operation	7 days	None
After operation	14-20 days	2-4 days
PINHOLE GLASSES	28 days	None
OUT OF WORK	3-6 months	6 weeks

The most important advantage of scleral buckling is that it has permitted operations on many cases which were previously considered hopeless. The polyethylene tubing and black silk sutures appear, so far, to be well tolerated by the orbital tissues, and most of the complications observed have been minor. Future investigation in this area will be directed toward replacement of polyethylene tubing by even better-suited foreign bodies such as, perhaps, a slowly absorbable material.

Another aspect of this research is the statistical analysis of all available data. Between 1947 and 1956, over 4,500 patients suspected of having diseased conditions in the extreme fundus periphery of the eye were examined, and over 3,000 operations for retinal detachment were performed. Pertinent data are being recorded on special sheets, transferred to I.B.M. punched cards, and analyzed by machine. This work is far from being completed, but catalogs of symptoms already have proved invaluable.

It is well known that in most cases of uveitis, no etiological factor is found. Several authors incriminate sensitivity to certain bacteria, particularly streptococcus. When the eyes of patients affected by rheumatic fever are examined by the ordinary method of ophthalmoscopy, generally no uveitis is found. However, Dr. Brockhurst examined 71 patients with active rheumatic fever at the Good Samaritan Hospital, using the indirect ophthalmoscope and scleral pressure, and 20 of these patients showed either active or healed peripheral uveitis. A study of the eyes of nonaffected siblings is now in process.

Peripheral uveitis is not a rare condition; it is generally insidious and may remain asymptomatic for many years. Dr. Brockhurst found evidence that it may cause glaucoma by gradual closure of the filtration angle. It was also observed that it causes lens opacities and degeneration of the vitreous, the latter condition sometimes leading to retinal detachment.

With the aid of the new method of ophthalmoscopy, Dr. Okamura has discovered another clinical entity consisting of a peripheral choroidal detachment associated with retinal detachment; no breaks are found in the retina. There is evidence that this condition, which is often bilateral, is caused by a choroiditis, with formation of exudative fluid on both sides of the choroid. Shrinkage of the vitreous body is the cause of many retinal conditions, particularly retinal detachment. The shrinkage process may be observed clinically with a slit lamp and low-power microscope. The present apparatus, however, is inadequate and efforts are being made to improve the illumination, the definition of the image, and the versatility of the instrument.

A considerable portion of the activities of our Clinical Unit is devoted to the improvement of instrumentation used for examining and operating on the eye. For instance, pilot models of three new types of stereoscopic indirect ophthalmoscopes are now being studied. The first is an improved version of the present headband instrument; the second is an operating room model; and the third is a large model with greater magnification. Efforts are also being made to improve the equipment used for application of surgical diathermy to the eye. Pilot models of two different machines are now being tried. These models are lighter, more compact, and more efficient than the commercial apparatus currently available. Such work in instrumentation could not be performed without collaboration of our consultant in mechanical engineering, Mr. C. Mahlmann, and the Foundation's instrument maker, Mr. R. Thompson.

The importance of teaching in our Clinical Unit is emphasized by the fact that the Retina Foundation presently supports two Fellows, Dr. A. Rodriguez, from Bogotá (Colombia), and Dr. J. Contreras from Puebla (Mexico). Teaching also requires a good iconography relative to conditions of the vitreous and of the retina. Dr. I. Okamura is building up a collection of unusual fundus conditions. As the anterior portion of the fundus cannot at present be photographed, Mr. W. Stenstrom, our medical artist, is making fundus paintings of significant aspects of the fundus periphery. The teaching function of our Unit is also discharged by its participation in postgraduate courses, and individual staff members frequently lecture in other cities. Recently the Unit was asked to organize a symposium at the New York Academy of Medicine in order to give a complete picture of our work.

The interest and assistance of Dr. E. B. Dunphy, Chief of Ophthalmology, have made possible the growth and efficiency of the Clinical Unit of the Retina Foundation. Close association of this Unit with the units performing basic eye research at the Retina Foundation has been of incalculable benefit. Since the future of medicine depends largely on satisfactory integration of basic and clinical research, it is comforting to observe that this integration is proving so stimulating in the field of ophthalmology.

Charles L. Schepens, M.D.,
Director of the Retina Foundation
30 Chambers Street
Boston 14, Massachusetts

VOLUNTEER GROUPS

MGH STAFF WIVES HOSPITAL COMMITTEE

The Annual Meeting of the Staff Wives was held on May 1 in Bartlett Hall. The meeting was preceded by a coffee hour, at which time old friends met and exchanged greetings and new friends were made. Following this, the meeting was called to order by Mrs. Oliver Cope, who delivered a most inspiring talk on what the Staff Wives have accomplished in their short span of Hospital activity, and what they hope to accomplish in the future.

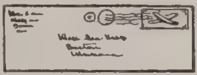
Elections were then held. The new Executive Committee is as follows:

President: Mrs. Charles B. Burbank
Vice-President: Mrs. Alfred Kranes
Secretary: Mrs. Joseph S. Barr
Treasurer: Mrs. Francis G. Barnum, Jr.
Chairman of Special Projects: Mrs. Marshall K. Bartlett
  Flowers: Mrs. Fred A. Simmons
  Furniture: Mrs. Morris H. Adler
  Housing: Mrs. Grant V. Rodkey
    Mrs. Benjamin Castleman
  Music: Mrs. John D. Crawford
  Publicity: Mrs. Morris H. Adler
  Reception Center: Mrs. Claude E. Welch
    Mrs. Avery D. Weisman
  Teas: Mrs. Daniel S. Ellis
    Mrs. Robert R. Linton

Mrs. Alfred Kranes, Vice-President, serves as liaison between the Community Chairmen and the Executive Committee.

The Community Chairmen are:

Belmont: Mrs. Warren Point
Boston, Chelsea, West Roxbury, Roslindale: Mrs. Wyland F. Leadbetter, Mrs. Richard H. Sweet
Brookline: Mrs. H. Dunster Howe
Cambridge: Mrs. William D. Sohier, Jr.
Chestnut Hill: Mrs. Carter R. Rowe
Dedham, Needham, Milton, Braintree, Quincy: Mrs. Frederic Tudor
Lexington: Mrs. Lovick C. Miller, Jr.
Lincoln, Concord, Wayland, Waltham, Watertown, Weston: Mrs. Robert S. Shaw
Newtons, Auburndale, Waban: Mrs. E. Wayne Wilkins, Jr.
Winchester, Melrose, Malden, Arlington, Stoneham, Wakefield: Mrs. Robert L. Berg
Wellesley, Natick, Cochituate: Mrs. Jackson M. Thomas
North Shore: Mrs. Joseph Stokes, III



We are most grateful to Dr. Paul D. White for sending us this letter:

> I am sending you the enclosed item for THE NEWS. This is the result of my recent travels. I thought it might be of interest to their friends in the Massachusetts General Hospital and among the alumni who live elsewhere to have recent news about the following who have been associated with us in the past:
>
> Dr. Chiu-an Wang of Hong Kong, H.M.S., MGH surgical resident, 1946
> Dr. Hsi-Chin Tsai of Taipeh, Formosa, member of the cardiac graduate class of 1953-54
> Dr. Ang Giok San of Manila, member of the cardiac graduate class of 1953-54
> Dr. Mariano Alimurung of Manila, associated with the cardiac group at the House of the Good Samaritan and at the M.G.H., 1948
> Dr. R. B. F. Khambatta of Karachi, Pakistan, member of the cardiac graduate class of 1951-52
> Dr. S. Padmavati of New Delhi, India, who has been on several occasions a visitor in the cardiac group at M.G.H.
>
> Dr. Wang is in active surgical practice in Hong Kong, doing an excellent job, though quite homesick for the M.G.H. In April, Mrs. White and I had a very pleasant reunion with him and his family and friends in Hong Kong. He is one of the few Harvard graduates in that part of the world. He sent his very best wishes to all his old associates and friends.
>
> Dr. Tsai is Professor of Medicine on Taiwan (Formosa), and I had the pleasure of meeting him briefly and seeing a patient with him on Sunday morning, April 15, in a hospital clinic in Taipeh. He, likewise, sent his best wishes.
>
> Drs. Ang and Alimurung I met at the annual meetings of the Philippine Medical and Heart Associations and at the inauguration of the new Asian-Pacific Society of Cardiology at its first Congress in Manila. (The next Congress will be held in Australia in 1960.) Drs. Khambatta and Padmavati were also present at this first Asian-Pacific Congress of Cardiology which was held on April 18 in Manila. I should have added that Dr. Maddox of Sydney, Australia, Professor Maekawa of Kyoto, Japan, and Professor Wollheim of Germany (three members of the International Council of Cardiology) were present at the inauguration of the Asian-Pacific Society of Cardiology in Manila. They were present in Washington and Boston at the time of the Second World Congress of Cardiology in September 1954.
>
> While in Japan in April, Mrs. White and I had the pleasure of following in the footsteps of Dr. and Mrs. Means in a visit to St. Luke's Hospital in Tokyo, one of the most up-and-coming institutions in the Far East, where we met Professors Hashimoto and Hinohara, old friends of many American physicians. And, finally, we had a brief reunion in Tokyo with Dr. G. C. Sanchez, MGH resident in Medicine, 1951, and cardiac fellow in 1954, who had come over for a few days from his present post in our Army Hospital at Pusan, Korea.

New addresses:—

Dr. John W. Bell (*E.S.* 1946), Veterans Administration Hospital, Sunmount, N. Y.
Dr. Jimmie Brockman Holland (r.p. *Psychiat.* 1955), 302 Crosby Blvd., Eggertsville, N. Y.
Dr. Dean K. Crystal (*W.S.* 1942), 1110 Harvard Ave., Seattle, Wash.
Dr. Gerald G. Garcelon (clin. assoc. *S.*), 701 Washington St., Newtonville, Mass.
Dr. Henry B. Garrigues (*W.S.* 1939), 1116 Summit Ave., Seattle, Wash.
Dr. Albert P. Heusner (*E.S.* 1939), University of North Carolina School of Medicine, Chapel Hill, N. C.
Dr. Stephen M. Krane (*M.* 1952), Dept. of Biochemistry, Washington University School of Medicine, St. Louis, Mo.
Dr. William K. Livingston (*W.S.* 1922), Dept. of Surgery, University of Oregon Medical School, Portland, Oreg.
Dr. William S. McCune (*W.S.* 1937), 1150 Connecticut Ave., Washington 6, D.C.
Dr. S. Harvey Mudd (*M.* 1954), Laboratory of Cellular Pharmacy, National Institute of Mental Health, National Institutes of Health, Bethesda, Md.
Dr. John D. States (a.r.s. *Or.* 1955), 221 Farmington Rd., Rochester, N. Y.
Dr. Clifford J. Straehley, Jr. (*W.S.* 1947), Medical Arts Bldg., Syracuse, N. Y.
Dr. Wirjo K. Subiakto (gr. stud. a. *Or.* 1956), Dept. of Surgery, University of Indonesia, Djakarta, Indonesia

---

Brief bits:—

Dr. Edward B. Benedict has been appointed to the Editorial Board of *Gastroenterology*.
Dr. Edward F. Bland presented two papers at the First International Symposium on Rheumatic Fever at the National Institute of Cardiology in Mexico City, April 30 - May 3.

No. 60 in a series of Staff photographs
Dr. Helen S. Pittman, Associate Physician

Later he addressed the National Institute of Medicine on "The later consequences of rheumatic fever".

Dr. Mary A. B. Brazier spoke over the radio on May 12, on the WBZ program sponsored by the Massachusetts Health Council.

Dr. Bradford Cannon spoke on the topic "Are we doing better in the care of burns?" at the Annual Postgraduate Day at Roger Williams General Hospital in Providence, R. I. On June 13, Dr. Cannon addressed the Staff of Mount Auburn Hospital at Combined Staff Rounds. His topic was "South Pacific adventure".

Dr. Edwin F. Cave spoke before the Quebec Society of Orthopedic Surgery and Traumatology at Montreal on April 20. His subject was "Fracture problems: The management of non-union of long bones and technique of the treatment of fractures".

On May 16, at the invitation of Marquette University, Milwaukee, Wisconsin, Dr. Edward D. Churchill presented the Convocation Address at the Honors Day program of Marquette University School of Medicine, on the occasion of the 75th anniversary of the University.

Dr. John H. Gibbon, Jr. of Philadelphia, who was a Research Fellow in Surgery at M.G.H. in 1930-31 and a Dalton Scholar in 1935, has been appointed Samuel D. Gross Professor of Surgery at Jefferson Medical College. While at Massachusetts General, Dr. Gibbon started his research work on a pump designed to maintain the circulation of oxygenated blood to the brain while cardiac action is halted. This device and its many modifications are now important adjuncts to the performance of intracardiac surgery.

Dr. Henry C. Marble has been awarded the honorary degree of Doctor of Science by Clark University.

Drs. Laurence L. Robbins and Stanley M. Wyman attended a Postgraduate Seminar on Diseases of the Heart at Walter Reed Army Medical Center, Washington, D.C., May 14-17. This seminar was given by the Armed Forces Institute of Pathology and co-sponsored by the American Heart Association, Inc.

Drs. J. Gordon Scannell and William R. Waddell attended the meeting of the American Association for Thoracic Surgery, held at Miami Beach, Florida, in May.

Dr. Charles L. Schepens was the recipient of an honorary degree at the 165th Commencement of Middlebury College. Dr. Schepens was cited for "significant and enduring contributions to man's knowledge of the causes and cures of impairment to his sight".

Dr. Arthur L. Watkins was guest speaker at the May 22 meeting of the Rhode Island Medical Society, held in Providence. His subject was "Medical rehabilitation in a general hospital setting: Dynamic medical rehabilitation".

* * *

The Reverend James H. Burns, Protestant Chaplain to the Massachusetts General Hospital since 1946, has been named to head the Departments of Social Relations and Pastoral Services of the Massachusetts Council of Churches. He will assume the duties of his new position in September, succeeding the Reverend Doctor Judson Howard who has been associated with the Council program for four years.

Mr. Burns did his undergraduate work in Business Administration at the University of Missouri. He received his Bachelor of Divinity degree from Andover Newton Theological School and Master of Sacred Theology degree from Boston University School of Theology. He also studied at Bates College, the University of Edinburgh, and Mansfield College at Oxford, and is now completing his dissertation for the Doctorate degree at Boston University School of Theology. He received clinical training and experience at the Rhode Island State Mental Hospital, the Boston Dispensary, and the Counseling Center at St. Paul's Cathedral and Emmanuel Church, Boston.

His professional experience includes chaplaincies at Western Maine Tuberculosis Sanatorium, Hebron Academy, Metropolitan Life Insurance Company Sanatorium, Gould Farm, and the Norfolk Prison Colony. He was ordained for the Baptist Ministry in 1937 and has held pastorates in Maine and Massachusetts.

Currently Mr. Burns is instructor in the Department of Psychology and Pastoral Counseling at Boston University School of Theology, teaching Religion and Health, and supervising students in Clinical Pastoral Training and serving as staff counselor of the Pastoral Counseling Service. At the Massachusetts General Hospital he directs the Summer School of Pastoral Care and is Chaplain of the McLean Hospital. He is Treasurer of the Institute of Pastoral Care; an accredited chaplain with the American Protestant Hospital Association and former Chairman of its Board of Accreditation; a member of the National Council of Churches' Department of Pastoral Services; and a member of the Personnel Committee of the Department of Pastoral Services of the Massachusetts Council of Churches. Mr. Burns also serves as a member of the Corporation of the New England Baptist Hospital and as a member of the Council of the Protestant Guild for the Blind.

* * *

The Doctors' Dining Room was filled to overflowing on the afternoon of June 1. The occasion was the good-bye party given in honor of Miss Mathilda M. Wagner who was that day ending her 34 years of service in the Purchasing Department of Massachusetts General Hospital. Besides the well-wishes of scores of friends and expressions of appreciation for the years of outstanding service Miss Wagner has given to the Hospital, she was presented with a lovely wrist watch and a wallet containing a handsome sum of money.

Miss Wagner left the Hospital to become associated with Dr. Paul D. White at his Beacon Street office.

THE NEWS

No. 159 Boston, Mass. September 1956

A VISIT TO BART'S

Saint Bartholomew's Hospital, London, is the oldest hospital in Britain. It was founded by the monk Rahere in the year 1123, in the reign of King Henry I, and ever since it has been in use for the care of the sick on the site of its original foundation. Despite its antiquity it is today a modern teaching hospital of the first rank. When, therefore, through the kindly offices of my friend, Dr. E. F. Scowen, I received an invitation to spend the month of May there as "Temporary Director of the Medical Professorial Unit", I accepted with alacrity. Dr. Scowen is the permanent Director, and when I expressed some doubts as to my present competence to discharge the duties suggested by so exalted a title, he at once dispelled them by telling me that I could do anything I liked and the registrar would keep me out of mischief. Such was my briefing and, so far as I am concerned, the arrangement worked out to perfection.

I arrived in London directly from Boston by PAA on the morning of May 2, and having established myself at the English Speaking Union's delightful Dartmouth House, where I was to live, I proceeded directly to Bart's.

The hospital stands just outside the old Roman wall but within the area of that strange political entity known as the City of London, which lies like a fetal rest deep within the body of the great modern metropolis. The main entrance is through the Henry VIII Gateway facing Smithfield Market, the place where Queen Mary burned the heretics, including an ancestor of Dr. Joseph Garland (*E.M.* 1921)! I was not altogether a stranger to it, for in 1924 I had, on a number of occasions, made ward rounds with Professor Francis Fraser, then head of the same full-time medical unit on which I was now to serve. Hardly had I traversed the arched gateway when my host, Dr. Scowen, came striding to meet me. We quickly crossed the great square of Bart's with the famous fountain in the middle and massive stone blocks, three ward and one administrative, which compose its four sides. Following a bypass, something like the old MGH isthmus, and called facetiously "the colostomy", we entered the King George V Building which houses all the wards of general medicine and surgery — approximately 500 beds altogether. With special services the hospital now has about 800 beds, which is all that is permitted by the Ministry of Health. This building is new since I had previously been to Bart's, but is so much in the original style that I would not have realized this.

There are five services, as we call them. The British call them firms, in both medicine and surgery. A medical and corresponding surgical firm occupy each of five floors in the King George V Building, each with an open ward for men and one for women. There are no private pavilions, wards, or rooms at Bart's. The open wards have a few single rooms attached to be used solely for medical need. No one can hire such a room or have it because he wants it. All patients are treated alike in this great hospital. Anyone may be admitted, and his financial status has no bearing on his eligibility for admission. The hospital is budgeted by the National Health Service for the care of its full quota of patients. Four firms each in medicine and surgery are on the part-time basis. Their physicians and surgeons are also Harley Street consultants in private practice. One surgical and one medical firm have full-time staffs and are known as the Professorial Units. As I have said, Dr. Scowen is head of the medical, and his opposite number in the surgical unit is Sir James Paterson Ross. The units are on the top floor of the George V Building, with doctors' offices and research laboratories. Senior students — ward clerks (pronounced "clarks") — are taught, as with us, on all ten of the firms. Of course, the British invented the ward clerk system. We got it from them. Introduced by Osler to Baltimore, it was later brought to Boston by Christian, Edsall, and Cushing.

Arrived then in Scowen's office, my duties were determined — two rounds a week with house physician and registrar (corresponding to intern and resident), and two teaching rounds with clerks, also one grand round and a number of research conferences. I was to give one formal lecture to medical students, and per request, believe it or not, it was on the thyroid — treated, however, in a new manner. You can read it later, if you wish, for it will be in the *St. Bartholomew's Hospital Journal*. Otherwise, I was to do as I pleased. As it turned out, most of my time was spent at Bart's, but I did have some other activities which will be mentioned later.

It was a great delight for me to walk the spacious, really beautiful open wards of Bart's. There is dignity and order in them which I like. The nursing is superb. The head nurse, always called Sister, is a career woman, with extraordinary competence and keen knowledge of all her patients. My house staff was tops, and the clerks as keen as ours and very easy to get on with. About the only difference from ours is that they have somewhat more formal manners. I like that, also.

The disease spectrum is much like that in MGH medical wards. Perhaps there is a somewhat higher concentration of chronic bronchitis and emphysema, due no doubt to London's smoggy atmosphere. Because Scowen had two special research interests — ankylosing spondylitis and congenital oxaluria— there were a number of patients with each of those maladies. I found a sufficient number and variety of thyroid cases to give material for some of the teaching rounds, and enough cases of ulcerative colitis and peptic ulcer to hold forth on the psychosomatic angle.

Once a year a time-honored ceremony is gone through at Bart's — View Day —and as it comes in May, I was in on it. Promptly at 2 P.M. a reviewing party consisting of the treasurer and steward of the hospital, both in morning coats, and matron, began a visit to every ward in the hospital seriatim. In each ward the doctors and Sister and her nurses were lined up to receive them. Although there was a fair sprinkling of morning coats among doctors, this was not completely obligatory, which let me out for I had none with me. On arrival, the treasurer seated himself at a table and everyone else stood up. The steward, in a loud voice, read the roster of patients in the ward. When he had finished, the treasurer asked the patients if there were any complaints. There were none. Then he asked Scowen if he was satisfied with the nursing—yes—and Sister if she was satisfied with everything in her bailiwick—yes—and so the reviewing party proceeded to the next ward, and so on. The whole process lasted about two hours, and all during this time the Square below was filling up with a great throng of people—alumni, alumnae, friends of the hospital, etc., etc. As soon as the visitation was over, all these people poured into the wards where the Sisters were ready for them with great tables of sweets and gallons of tea. It was old home week in the wards for fair, and the patients all seemed to enjoy it also.

When I arrived at Bart's, to my great pleasure I found I had an opposite American number on the surgical unit—no other than Western Reserve's Professor of Surgery, F. A. Simeone (*W.S.*

1936). Shortly after my arrival, the Dean of the Medical College, Mr. E. G. Tuckwell, M.Ch., F.R.C.S., gave a charming little dinner for Simeone and me, at which we were both enrolled as "Perpetual Students of the Medical College of St. Bartholomew's Hospital". This is the greatest honor that can be given a teacher, because it implies that he is still capable of learning!

A word must be said of the medical college. It started in a rather imperceptible manner. It is believed that as early as the middle ages students came to the hospital as apprentices. In the sixteenth and seventeenth centuries they came in increasing numbers to observe the medical and surgical practice at the hospital. Gradually the hospital provided facilities for them, formal lectures by members of the staff, notably Abernethy, and in 1843 a residential college, museums, libraries, and dissecting rooms. Thus a medical school slowly grew within the womb of the hospital, which, after a long gestation, was only in the present century to obtain corporate independence under its own royal charter. Its name became "The Medical College of St. Bartholomew's Hospital in the City of London".

This is the developmental pattern of most or all of the medical schools of London. In each case they were the creatures of pre-existing teaching hospitals. Finally, together with various schools and colleges in other fields of learning, they have been gathered together and tied in one large university package, through the instrumentality of a superstructure — the relatively modern University of London. This happened to the Medical College of St. Bartholomew's Hospital in 1901, and the current calendar of the University of London shows no less than twelve undergraduate medical schools in the same relationship. Each is entered as a "School of the University in the Faculty of Medicine". Fancy that — one university with twelve medical schools! However, they are united in one university faculty of medicine, and their teachers of professorial, and some other ranks, are appointees of the University. This arrangement has special significance in the case of the "professorial units" in the clinical subjects which have been set up in several of the teaching hospitals.

At Bart's, the clinical departments of the school are, of course, in the hospital. The preclinical, and indeed what we would call premedical collegiate subjects, are housed in a new campus a quarter of a mile from the hospital, beside the ancient Charterhouse. The college was installed on this site by 1935, but in the last war its buildings were largely destroyed. The present lot are chiefly post World War II erections, and very fine ones they are indeed. A new and attractive residential college—their Vanderbilt Hall, so to speak—and fine new buildings with very modern laboratories and lecture rooms are in use and more are under construction. Dr. Scowen had very much to do with the planning and building of these facilities. In addition to being Director of the Medical Unit at the hospital, he holds the office of Warden of the Medical College and resides in the Warden's House at its gate, beside the old Charterhouse Church, where on two occasions I had the pleasure of dining with him.

Many people were kind to me at Bart's, particularly the staffs of the full-time units. I saw a couple of friends from 1924 days, also — Sir Francis Fraser and Dr. George Graham, both now retired from Bart's but busy elsewhere, Fraser as Director of the British Post-graduate Medical Federation, also an activity of the University of London, and Graham as a member of one of the Regional Hospital Boards of the National Health Service. Another old friend, now head of one of the medical firms, Dr. A. W. Spence, I had known when he worked in the United States with David Marine. Finally, my thanks are due to my registrar, Dr. David Mendel, who constantly saw to my every need, and to my House Physician, Dr. Margaret Staley, and to the Sisters of Garrod and Stanmore Wards, all of whom were most assiduous in making me feel at home in my new surroundings.

Extracurricular activities also gave me many contacts. Mr. Selwyn Taylor, who spent the academic year 1948-49 at the M.G.H. in surgery, was especially kind to me. On his invitation I lectured to students at King's College Hospital Medical School, another of the University of London's flock, and Taylor's own school. I chose the title "The span of the doctor's responsibility". I also had a delightful Sunday luncheon with the Taylors at Roehampton, and that same day supped with Mrs. Eric Bywaters and her children next door at Barnes. Bywaters was in Boston when I was at Barnes.

Two week-end jaunts, one to Birmingham to visit Walter (*M.* 1950) and Anne St. Goar (*M.* 1949), the other to Bowness on Lake Windemere to visit my old friend, Dr. John Hay, were both happy occasions. At Birmingham I saw the fine medical center—school and hospital, where Walter St. Goar was just finishing a year in the clinic of Professor W. M. Arnott. They are anticipating with pleasure at Birmingham having in their midst, come this autumn, one Walter Bauer, who will take on certain distinguished functions there, and in similar mood they recall a recent visit from E. D. Churchill.

Returning to London, the St. Goars drove me as far as Oxford where we all foregathered with the Alec Leafs (*M.* 1944). Alec is working in the Cell Metabolism Research Unit of Professor Krebs on a basic problem of sodium transport.

At Windemere I had delightful conversations with Dr. Hay, formerly Professor of Medicine at Liverpool, whom I have known for years. He is retired now to a lovely cottage and gardens with a view of the lake. We talked of many things running from the National Health Service to flying saucers, one of which had been sighted in his neighborhood!

Other activities included a visit to Mill Hill and Hampstead with Sir Charles Harington and Mrs. Rosalind Pitt-Rivers, both well known at the M.G.H. We talked, believe it or not, chiefly about thyroid hormones. Another day I went to Hampstead again with Dr. Raymond Greene, where, at New End Hospital, I saw the excellent thyroid clinic which he is putting on with his surgical colleague, Mr. Piercy. They have a wealth of patient material there and are making studies by various modern methods. Still another delightful diversion in Hampstead consisted of dinner with the Donald Hunters, both of whom, it will be recalled, worked with Aub early in the history of the M.G.H.'s Ward 4. Hunter has become the most outstanding physician in industrial medicine in Britain.

Speaking of old MGH-ers, I may say also that Professor Querido of Leiden, about whom Stanbury has recently written in THE NEWS, came over to London and we had a pleasant dinner and evening together — the thyroid also being present. One morning, too, G. Watson James, III (*M.* 1944) of the Medical College of Virginia turned up for breakfast. He was *en route* to a high-powered vitamin B12 conference in Hamburg. It is thrilling to meet so many of one's former house staff members, all doing important things in medicine.

The Thyroid Club of London had a dinner while I was there, and practically everybody engaged in thyroid research was present — Harington, Pitt-Rivers, Greene, Pochin, Russell Fraser, Spence, and many others. Sir Geoffrey Keynes of Bart's, he of thymectomy for myasthenia gravis fame, presided. It was announced that the next International Goiter Conference will be held in London in 1960. We must send a strong delegation.

The final salient feature of my month in London was the meeting of the Association of Physicians of Great Britain and Ireland, which Osler founded after the pattern of the Association of American Physicians. I attended as official representative of the American Association and was most cordially welcomed. The program was good, and I met a lot of old friends and made new ones. The attendance was excellent. The grand finale was the Association's Annual Dinner. Being its jubilee, the affair was held at the Mansion House with all the ceremony the British love. The Lord Mayor was host; the Lord Chancellor and other bigwigs were present. It was a delightful occasion, but there was more ceremony than cerebration, and the former interfered somewhat with that friendly intercourse so characteristic of the American Association's dinner parties.

I left England full of gratitude to

many people, and with the feeling that I had been a fortunate person to have had such an experience. The objectives were so thoroughly medical that I did almost no sightseeing — a trip to Greenwich by river with some of the members of the Association of Physicians was all. I particularly tried to get up to date on the British National Health Service, medical education in Britain, and thyroid research.

Finally, there was one experience, nonmedical but nonetheless connected with the M.G.H. — tea with the Archbishop of Canterbury at Lambeth Palace! Needless to say, this was arranged for me by the Right Reverend Henry Knox Sherrill, D.D., for long Chairman of the Board of Trustees of the Massachusetts General Hospital. His Grace told me many interesting things about Cyprus, Africa, and other parts of the world. It was a rewarding occasion.

James Howard Means, M.D.,
Honorary Physician

* * *

On June 1, the Medical Faculty of the University of Zurich conferred upon Dr. Kurt H. Thoma, Professor Emeritus of Oral Surgery and Oral Pathology at Harvard Medical School and past Chief of our Dentistry Department, the Doctor of Medical Dentistry *honoris causa* "in recognition of his distinguished services in the advancement of the pathology and surgery of the oral organs by investigation and instruction".

Dr. Thoma was not only honored as an outstanding man in his profession, but also as a native of Switzerland. The degree was awarded at the opening of the Seventieth Swiss Odontologic Kongress, before which Dr. Thoma read two papers—one on "The progress of Oral Surgery", the other on "Graduate dental training in the United States". He also lectured before the medical and dental students at the University.

The honorary doctorate was awarded by the Dean of the Medical Faculty, in the presence of the Rector and other officials of the University. The last honorary degree was awarded in 1927.

* * *

Dr. John P. Bunker has been elected President of the Massachusetts Society of Anesthesiologists.

* * *

Professor Ernst Navratil of Graz, Austria, was Chief of the Gynecology Service, pro tempore, from June 26 through July 5. During his stay he delivered the Edward Peirson Richardson Lecture. His subject was "The indication for the vaginal radical operation by Schauta-Amreich and its results".

The Board of Trustees, at their meetings on April 13, May 25, and June 8 and 22, voted:

To grant Dr. A. Gedeon Matoltsy, Associate Biologist in Dermatology, leave of absence for one year, beginning October 1;

To reappoint Drs. Barr and Kranes as Members-at-Large on the General Executive Committee for one year, beginning July 1;

To change the beginning date of Dr. John A. Mills's appointment as Assistant Resident in Medicine from July 1 to October 1;

To change the beginning date of Dr. Katharine E. Spreng's appointment as Assistant Resident in Medicine from September 1 to October 1.

To appoint:

Dr. Leonard Atkins as Assistant in Pathology for one year, beginning July 1;

Dr. William J. Brown, Jr. as Assistant Radiologist, beginning July 1;

Dr. Mignon C. Chasen as Assistant in Psychiatry at McLean Hospital;

Dr. Edward M. Daniels as Psychiatrist at McLean Hospital, beginning April 16;

Dr. Kurt J. Isselbacher as Assistant in Medicine, beginning July 1;

Dr. Richard B. Kearsley as Assistant to the Children's Medical Service, beginning July 1;

Dr. John Mealey, Jr. as Second Assistant Resident in Neurosurgery, for six months, beginning July 1;

Dr. Richard G. O'Brien as Assistant in Radiology, beginning July 1;

Dr. John S. Robey as Assistant to the Children's Medical Service, beginning July 1;

Dr. Stephen L. Washburn as Resident in Psychiatry at McLean Hospital, beginning July 1.

At their meetings on March 14, and during June and July, the General Executive Committee voted:

To promote:

Dr. William G. Austen from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;

Dr. Arthur E. Baue from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;

Dr. David L. Collins, Jr. from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;

Dr. Walter C. Cotter to the position of Resident in Neurosurgery, for six months, beginning July 1;

Dr. Richard R. Curtin from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 1;

Dr. Oscar S. DePriest, III, from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, effective when he returns from service in the Armed Forces;

Dr. A. Erik Gundersen from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;

Dr. John M. Head from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 1;

Dr. Stephen E. Hedberg from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;

Dr. Gilbert Hermann from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;

Dr. Benjamin B. Jackson from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 1;

Dr. Raymond N. Kjellberg to the position of First Assistant Resident in Neurosurgery, for six months, beginning July 1;

Dr. Walter E. Klingensmith from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, effective when he returns from service in the Armed Forces;

Dr. Charles F. McKhann, III, from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;

Dr. John A. Malcolm from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 1;

Dr. Ronald A. Malt from the position of Intern to that of Third Assistant Resident in Surgery, effective when he returns from service in the Armed Forces;

Dr. Eugene R. Nobles, Jr. from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;

Dr. Donald P. Pederson from the position of Assistant Resident to that of Chief Resident in Anesthesia, beginning August 1;

Dr. Majic S. Potsaid to the position of Resident in Radiology, beginning July 1;

Dr. Stuart E. Price, Jr. from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, effective when he returns from service in the Armed Forces;

Dr. Robert S. Richards to the position of First Assistant Resident in Radiology, effective as of July 1;

Dr. Farrokh Saidi from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;

Dr. Quentin R. Stiles from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;

Dr. Harold C. Urschel from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;

Dr. C. Gene Wheeler from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1.

To reappoint:

James E. Anliker, Ph.D. as Research Fellow in Anesthesia for one year, beginning July 15;

Saul Aronow, Ph.D. as Research Fellow in Physics (Medicine), beginning July 20;

Dr. John S. Barlow as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. William H. Batchelor as Clinical and Research Fellow in Medicine, effective September 1;

Dr. William R. Brewster, Jr. as Clinical and Research Fellow in Anesthesia for one year, beginning July 1;

Dr. Rafael M. Casas as Clinical and Research Fellow in Surgery for one year, beginning July 1;

Dr. John L. Decker as Research Fellow in Medicine, beginning July 1;

Dr. Harry B. Ditmore, Jr. as Second Assistant Resident in Surgery, beginning July 1;

Dr. Elias C. Dow as Clinical and Research Fellow in Medicine, beginning July 1;

Dr. Joachim S. Gravenstein as Clinical and Research Fellow in Anesthesia, effective August 16;

Dr. Frederick S. McAlpine as Assistant Resident in Anesthesia for one year, beginning July 15;

Dr. Roger A. Melick as Clinical and Research Fellow in Medicine, effective September 15 through December 31;

Dr. George B. Murphy, Jr. as Second Assistant Resident in Surgery, beginning July 1;

Dr. Hugo M. Palazzi as Clinical and Research Fellow in Surgery, beginning July 1;

Dr. Geraldine M. Peiffer as Assistant Resident in Anesthesia for one year, beginning August 1;

Dr. Sholem Postel as Clinical and Research Fellow in Medicine, beginning July 15;

Dr. Claude E. Raynaud as Clinical and Research Fellow on the Children's Medical Service for one year, beginning September 1;

Dr. Edward S. Rendall as Clinical Assistant in Medicine, beginning August 1;

Dr. Jens G. Rosenkrantz as Second Assistant Resident in Surgery, beginning July 1;

Dr. Richard L. Rovit as First Assistant Resi-

dent in Neurosurgery, assigned to the Neuropathology Laboratory, for six months, beginning August 1;
Dr. John A. Scholl as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;
Dr. Mary L. Scholl as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Dr. Sabino J. Sinesi as Clinical and Research Fellow in Dermatology for one year, beginning July 1;
Dr. Ernest A. Sneddon as Clinical Associate in Anesthesia, effective March 4;
Pierre J. J. Stoffyn, Ph.D. as Research Fellow in Medicine, effective September 1;
Dr. Alexander B. Timm, Jr. as Resident in Dermatology for one year, beginning July 1;
Dr. Giles D. Toll as Second Assistant Resident in Surgery, beginning July 1;
Dr. Thorkild Waino-Andersen as Clinical Fellow in Anesthesia, effective May 18;
Dr. John R. Ward as Clinical and Research Fellow in Medicine, beginning July 1.

To extend the appointments of:

Dr. Edward Dunn as First Assistant Resident in Surgery, through August 31;
Dr. John D. Pitts as First Assistant Resident in Surgery, through August 31.

To appoint:

Dr. Ramon Alcerro-Castro as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. John Anderson as Clinical and Research Fellow in Medicine for one year, beginning October 1;
Dr. Dirk Baier as Clinical Fellow in Anesthesia, beginning August 1;
Dr. Charles H. Belcher as Clinical Fellow in Psychiatry for one year, beginning July 1;
Dr. Norman R. Bernstein as Clinical Assistant in Psychiatry for one year, beginning July 1;
Dr. E. Ruth Breitwieser as Clinical and Research Fellow in Medicine, for the period June 15 through September 30;
Dr. Curtland C. Brown, Jr. as Clinical and Research Fellow in Medicine for one year, beginning August 15;
Dr. Herbert S. Cline as Clinical Fellow in Psychiatry for one year, beginning July 1;
Dr. William P. Corvese as Clinical and Research Fellow in Surgery for one year, beginning July 1;
Dr. John C. Dalton as Clinical Assistant in Medicine, effective as of July 1;
Dr. Leslie J. DeGroot as Clinical and Research Fellow in Medicine, for the period July 1 through December 31;
Dr. Alexander N. Drescher as Clinical and Research Fellow on the Children's Medical Service, beginning July 1;
Dr. Ellis Dresner as Clinical Assistant in Medicine, beginning July 1;
McIver W. Edwards, Jr., B.S. as Research Fellow in Biochemistry, beginning July 2;
Dr. Martin E. Etchart as Graduate Student Assistant in Pathology for one year, beginning September 15, 1955, retroactively, and to reappoint him for one year, beginning September 15;
Golda J. Eversmeyer, Ph.D. as Research Fellow in Psychology for one year, beginning August 1;
John H. Fessler, B.A., B.Sc., M.A. as Research Fellow in Medicine, effective September 1;
Dr. Felix G. Freund as Clinical Fellow in Anesthesia, beginning July 17;
Dr. Melvin J. Glimcher as Clinical and Research Fellow in Orthopedic Surgery, beginning July 1;
Dr. Leonard E. Glynn as Clinical and Research Fellow in Medicine, beginning some time this fall;
Dr. Sen-itiro Hakomori as Research Fellow in Medicine, effective September 1;
Dr. Timothy S. Harrison as Clinical and Research Fellow in Surgery, effective as of July 1;
Dr. Erik H. C. Heidensleben as Research Fellow in Neurosurgery, beginning September 1;
Dr. Lee Jackson as Clinical and Research Fellow in Psychiatry, beginning July 1;
Dr. Mervyn Jeffries as Clinical Fellow in Anesthesia for one year, beginning October 1;
Dr. Rudolph J. Junda as Clinical Fellow in Surgery, assigned to the Tumor Clinic, for one year, beginning July 1;
Wallace A. Kennedy, M.A. as Research Fellow in Psychology for one year, beginning August 1;
Dr. Stephen M. Krane as Chief Resident in Medicine, effective January 1, 1957;
Dr. Philip E. Kubzansky as Research Fellow in Psychology for one year, beginning August 1;
Gloria F. Leiderman, Ph.D. as Research Fellow in Psychology for one year, beginning August 1;
Dr. Charles I. Levene as Research Fellow in Medicine, effective September 1;
Dr. Robert J. Lifton as Clinical Assistant in Psychiatry, beginning July 1;
Dr. Donald B. Martin as Clinical Fellow in Medicine, effective October 1;
Dr. Carol Meyers as Clinical Fellow in Orthopedic Surgery, effective as of June 13;
Dr. Yee P. Moon as Graduate Student Assistant in Orthopedic Surgery, for the period April 6 through October 31;
Dr. Yoshitsugu Nose as Research Fellow in Biochemistry, effective September 1;
Dr. Lot B. Page as Clinical and Research Fellow in Medicine, effective October 1;
Dr. James A. Petersen as Clinical Assistant in Radiology, beginning July 1;
Dr. Herbert A. Ravin as Research Fellow in Neurology for one year, beginning July 1;
Dr. Joseph D. Sabella as Clinical Fellow in Pathology for one year, beginning July 1;
Dr. Germán Sánchez-Checa as Clinical Fellow in Radiology, beginning September 15;
Dr. Charles M. Shugg as Clinical Fellow in Medicine, effective as of June 15;
Dr. Myron L. Stein as Clinical and Research Fellow in Psychiatry, beginning October 15;
Mary L. Stephenson, Ph.D. as Research Fellow in Medicine, beginning July 1;
Dr. Claire M. Stiles as Clinical and Research Fellow in Anesthesia, beginning June 4;
Zofia Tarasiejska, Ph.D. as Research Fellow in Medicine, effective September 1;
Dr. Richard J. Taylor as Clinical Fellow in Pathology, for six months, beginning July 1;
Dr. Charles V. Treat as Clinical Fellow in Medicine, effective July 15;
Dr. Stanley Wallach as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. George T. Watts as Clinical and Research Fellow in Surgery, effective as of September 15;
Dr. Charles H. Weed as Clinical Assistant in Medicine for one year, beginning July 1.

To change the titles of:

Dr. H. Arto Aprahamian from Assistant Resident in Anesthesia to that of Clinical Fellow in Anesthesia;
Dr. John R. Bumgarner from Graduate Student Assistant to that of Clinical Fellow in Medicine, and that he be reappointed for the period June 1 through September 30;
Dr. Chung H. Cho from Assistant Resident to that of Clinical Fellow in Anesthesia;
Dr. Salomon Hakim from Clinical and Research Fellow in Neurology to that of Research Fellow in Neurology for one year, beginning July 1;
Dr. Hunter Heath from Graduate Student Assistant to that of Clinical Fellow in Medicine, and that he be reappointed for the period June 1 through September 30;
Dr. Jack H. Mendelson from Assistant Resident to that of Clinical and Research Fellow in Psychiatry, effective July 1;
Dr. Herbert deN. Tucker from Graduate Student Assistant to that of Clinical Fellow in Medicine, and that he be reappointed for the period June 1 through September 30.

The General Executive Committee also approved of the transfer of Drs. Alfred J. Luessenhop and Dagoberto Sosa to the Veterans Administration Hospital, for a period of six months, beginning July 1.

* * *

PSYCHIATRY DEPARTMENT

Dr. Erich Lindemann has been invited to serve for the next five years as a member of the World Health Organization Expert Advisory Panel on Mental Health.

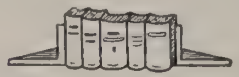
Dr. George Saslow and Dr. Joseph Matarazzo presented papers on their research work concerning Human Interaction at the national meetings of the American Psychological Association in Chicago at the end of August.

The psychiatry group will be strengthened by the arrival of Dr. Robert J. Lifton in September. Dr. Lifton has done considerable work on the so-called brain washing techniques which have been used in Communist China for the "reformation" of westerners and anti-communist Chinese.

On September 1, Dr. George Saslow took over the leadership of the Alcohol Clinic. Dr. Alfred Ludwig, who supervised an active program in service and research in the Clinic, is leaving us to join a research group at the Peter Bent Brigham Hospital.

Brief bits:—

Dr. Edward B. Benedict attended the meeting of the American Gastroscopic Society in Chicago, June 10 and 11. On June 10 he discussed a paper by Dr. John Tomenius of Stockholm, Sweden, on "Gastroscopic biopsy with Tomenius biopsy gastroscope". On June 11, at the Cook County Hospital, he demonstrated the technique of gastroscopic biopsy with the Benedict operating gastroscope.
Dr. Carter R. Rowe attended the meetings of the American Medical Association in Chicago and presented a paper on "Fractures in the aged" to the Orthopedic Section of the Convention on June 14.
Dr. Frederick G. Shaffer (*S.* 1952) has opened an office for the practice of Urology at 221 Fairmont Avenue, Fairmont, West Virginia.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and

Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Cardiology

Butterworth, J. S., and Sprague, H. B.
Prevention of 'cardiac crippling'.
M. News, pp. 1 & 7 (Mar. 26).

McGregor, M., Rappaport, M. B., Sprague, H. B., and Friedlich, A. L.
The calibration of heart sound intensity.
Circulation 13:252-256.

Pattavina, V., and Currens, J. H.
Mitral stenosis at age ninety-two.
Am. Pract. & Digest Treat. 7:944-945.

Sprague, H. B.
The art of auscultation of the heart.
Practitioner 176:241-249.

Sprague, H. B., and Ongley, P. A.
The clinical value of phonocardiography.
Cincinnati J. Med. 37:1-8.

General Medicine

Burrage, W. S., Greene, J. E., Burgin, L. B., Itkin, I. H., Novey, H. S., Engler, J., and Irwin, J. W.
Medical progress: Allergy.
New England J. Med. 255:79-85; 128-134.

Itkin, I. H., Burrage, W. S., and Irwin, J. W.
Alpha [(alpha-methyl-3,4-methylenedioxyphenylethylamino) methyl] - protocatechuyl alcohol hydrochloride in bronchial asthma.
J. Allergy 27:359-368.

General Surgery

Nardi, G. L.
Prevention of foaming in suction bottles following pulmonary resection.
J. Thoracic Surg. 31:737-738.

Storey, C. F., Nardi, G. L., and Sewell, W. H.
Traumatic aneurysms of the thoracic aorta: Report of two cases, one successfully treated by resection and graft replacement with the aid of a shunt.
Ann. Surg. 144:69-78.

Welch, C. E.
The care of the patient with advanced cancer.
In Cancer: A manual for practitioners, Boston, American Cancer Society (Massachusetts Division), Inc., 3rd edition, pp. 251-263.

Welch, C. E.
Choledochotomy.
Surg., Gynec. & Obst. 102:495-496.

Welch, C. E.
The colon.
In Christopher's textbook of Surgery, Lloyd Davis, M.D., Editor, Philadelphia, W. B. Saunders Company, 6th edition, pp. 654-669.

Welch, C. E.
Management of upper gastrointestinal hemorrhage.
California Med. 84:85-88.

Welch, C. E., and Rodkey, G. V.
Methods of therapy in diverticulitis.
Surgery 39:712-723.

Gynecology and Obstetrics

Graham, J. B.
Treatment of choice in cancer of the uterine corpus.
New England J. Med. 254:1112-1119.

Graham, J. B., and Graham, R. M.
The sensitization response in the vaginal smear.
Ann. New York Acad. Sciences 63:1458-1462.

Graham, J. B., Graham, R. M., Neri, L., and Wright, K. A.
Enhanced production of antibodies by local irradiation. I. Measurement of circulating antibodies.
J. Immunol. 76:103-109.

Graham, J. B., and Leskowitz, S.
Enhanced production of antibodies by local irradiation. II. Measurement of local antibodies.
J. Immunol. 76:110-111.

Graham, R. M., and Huse, L. W.
The cytologic grading of squamous carcinoma of the cervix.
Am. J. Obst. & Gynec. 71:1307-1311.

Immunology

Malt, R. A., and Cope, O.
Antibody production after certain forms of trauma.

BIOGLETS

Dr. Paul H. Black, Intern in Medicine—born in Boston, Massachusetts, March 11, 1930; English High School, Boston, Class of 1947; A.B., Dartmouth College, 1952; M.D., Medical School, College of Physicians and Surgeons, Columbia University, 1956.

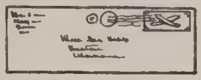
Dr. Dorothy B. Villee, Intern in Children's Medicine—born in Charleston, South Carolina, November 25, 1927; George Washington University, Washington, D. C., 1946-48; B.A. in Chemistry, Barnard College, Columbia University, 1950; Johns Hopkins University Medical School, 1951-52; M.D., Harvard Medical School, 1955; married; home in Boston, Massachusetts.

Alas, the Sir Cuthbert Wallace Cup has been lost to our tennis rival, the Peter Bent Brigham Hospital. On the Harvard University courts in late July, the venerable trophy was yielded, four matches to two, in a contest that was closer than the score indicates.

The Brigham quickly took a 1-0 lead. Dr. Sheldon Horsley set down Dr. Charles Keevil with steady ground stroking and some superb volleying, 6-3, 6-2. In the second match Dr. George Cahill of the Brigham finally solved "old Dad" Dr. John Knowles's spinning southpaw service and went on to win at 6-2, 6-4. Dr. Paul Veazey of the M.G.H. then made the score 2-1 as he overpowered Dr. Harvey Gonick 6-2, 6-2. Dr. Steve Washburn of M.G.H. put up a magnificent battle against Dr. Rudy Froesch before losing 10-8 in the third set. This match had many exciting prolonged rallies and was clearly the best of the day.

The doubles provided another close contest as Drs. Horsley and Cahill of the Brigham defeated Drs. Knowles and Keevil at 6-3, 4-6, 6-3. Dr. Horsley's remarkable net game provided the winning margin. Dr. Veazey then teamed with Dr. Washburn, and they succeeded in salvaging a second point for the M.G.H. as they took the measure of Drs. Froesch and Gonick by a score of 6-2, 7-5.

And so, for at least one year, "the cup" will not grace our Archives Room. Let's hope that this most enjoyable competition can be renewed next year.



New addresses:—

Dr. Joseph Albert (a.r.p. *D.* 1956), 165 Columbia Rd., Dorchester, Mass.

Dr. James T. Wheeler (*M.* 1956), U. S. Naval Hospital, Chelsea, Mass.
Dr. LeMoyne White (*E.M.* 1942), 205 Beacon St., Boston, Mass.
Dr. Benjamin S. Wood (*E.S.* 1933), Nantucket, Mass.

* * *

June 22, 1956 will be recalled as Dr. Joseph C. Aub Day in the annals of Massachusetts General Hospital, it having been the day on which Dr. Aub was honored by his staff and many friends for his outstanding work in the field of cancer research.

About five hundred of Dr. Aub's friends attended a party in the afternoon, given in the lobby of the new building by the members of the Huntington Memorial staff and the Hospital. Light refreshments and punch were served, while background music was furnished by Mondello's Concert Band — a group which has often played at functions given by the American Cancer Society

Following the social hour, Dr. Clark assumed the role of chairman for the rest of the program and introduced Mr. Phillips Ketchum, President of our Corporation, as the first of a series of three-minute speakers. Mr. Ketchum paid high tribute to Dr. Aub's work and ended his remarks by presenting to Mr. Francis C. Gray, Vice-President of our Corporation and Chairman of our Board of Trustees, a portrait of Dr. Aub done by the well-known painter Pietro Pezzati. Mr. Gray accepted the portrait in the name of the Trustees, and added his own words of appreciation of Dr. Aub's significant contributions to the field of medical research. Dr. Clark then introduced Dr. George Packer Berry, Dean of Harvard Medical School, who spoke particularly of Dr. Aub's inestimable work at the Medical School. Dr. Clark then introduced Dr. James Howard Means, who reviewed briefly and with sometimes a touch of humor his own early experiences with Dr. Aub, including those at Base Hospital 6 during World War I. Dr. Means also spoke of Dr. Aub's association with the renowned Dr. Walter B. Cannon. Throughout each of these talks ran the central theme of affection for Dr. Aub as a man as well as admiration for his work in the professional field. Dr. Aub responded to all this with words of deep-felt appreciation.

On the evening of the 22d, a cocktail party and buffet dinner were given for Dr. Aub at the Museum of Science by the Huntington staff. Many friends came from considerable distances to pay homage to the guest of honor. Among these were Dr. David Karnofsky and Dr. Rulon W. Rawson, from Memorial Hospital, New York City; Dr. and Mrs. Louis H. Hempelmann, from the University of Rochester Medical School; Dr. Jytte Muus, from Mount Holyoke College; Dr. Hugh Tatlock, from Northampton; and Dr. Rolf Lium, from Portsmouth, New Hampshire. All of these doctors had worked with Dr. Aub at one time or another. Other "notables" present were Dr. and Mrs. Dean A. Clark, Dr. and Mrs. Walter Bauer, Dr. and Mrs. Edward D. Churchill, Mr. and Mrs. Phillips Ketchum, and Dr. and Mrs. Francis O. Schmitt.

After the dinner, Dr. Charles C. Lund acted as toastmaster, and short speeches honoring Dr. Aub were given by Drs. Bauer, Means, and Shields Warren.

Dr. Aub was presented with a plaque bearing the names of the donors to the Joseph C. Aub Lectureship Fund — a fund set up by the members, past and present, of the Huntington Memorial Laboratories. In addition, a fund was presented to Dr. Aub for the support of a young investigator in cancer research. This fund was started by a large donation for the above purpose by one of Dr. William H. Baker's grateful patients.

On June 30, Dr. Aub retired as Head of the Huntington Memorial Hospital. He has been appointed a member of our Board of Consultation, and will carry on his work in office quarters to be provided for him in the new building.

THE NEWS

No. 160 Boston, Mass. October 1956

THE COBALT BOMB

AN APPLICATION OF ATOMIC ENERGY TO RADIATION THERAPY

In July of this year, a "cobalt bomb" was installed at the Massachusetts General Hospital for radiation therapy. It is the first of this particular design to be installed in the United States, and the first unit of any type in Massachusetts. It is thought that some of the background of this new machine may be of interest to readers of The News.

A "cobalt bomb" is, in essence, a new kind of X-ray machine. The source of the radiation is a small intensely radioactive piece of cobalt metal. It is surrounded by a massive protective lead shield, in which is a single opening of adjustable size, through which a useful beam of radiation emerges. This opening may be closed completely by a heavy shutter, so that the radiation is then "turned off". The size of the emergent beam may be adjusted by thick metal diaphragms at the sides of the opening to match the size of the malignancy under treatment.

RADIOACTIVE COBALT

It has been possible to make materials artificially radioactive ever since 1934, when this was first achieved in France by physicists Frederic Joliot and his wife; but the production of large amounts of radioactivity became feasible only with the development of the nuclear reactor during World War II. In the reactor, materials bombarded continuously by neutrons, penetrating subatomic particles, may become intensely radioactive. The idea quickly arose of producing highly concentrated radioactive materials emitting penetrating radiation which could be substituted for therapeutic X-ray machines. In fact, radium element has been used in this way for many years, but it has never been available cheaply enough or in large enough quantities to provide an amount of radiation comparable with the output of conventional X-ray machines. Now, however, there are several artificially produced radioactive substances available for this purpose, chief among them being radioactive cobalt.

A radioactive material for use in deep therapy equipment must have certain properties. (a) It should emit rays which penetrate human tissue as effectively as ordinary therapeutic X-rays — or even better, if possible. (b) The radioactivity should last a long time — that is, it should preferably have a half-life of at least a year. (c) It should be very readily produced by activation in a reactor so that a large amount of radioactivity can be concentrated in a very small size. (d) It should preferably be a solid material, not a gas or a liquid, easily available and conveniently handled.

After the war, physicists quickly recognized that cobalt metal in the form of Co 60 is practically an ideal material on all the above counts and stands almost alone for the specific purpose of therapy, equivalent to that available with supervoltage equipment. The rays that are emitted have about the same penetration in tissue as X-rays from a 2-million-volt X-ray machine; the half-life is over 5 years; a very large activity may be induced in a few grams of material. Nevertheless, it is only in the last few years that sources powerful enough to rival X-ray machines have become available and that manufacturing companies have housed these sources in suitably engineered devices. Cobalt in radioactive form and suitable for therapy is produced by inserting small pieces of ordinary cobalt metal into nuclear reactors and subjecting them to neutron bombardment for, in general, at least one year.

Today, the use of Co 60 in place of or alternating with supervoltage X-radiation is entirely practicable. It has the advantages of being of relatively small physical size, easy to manipulate, economic and reliable, and possessing radiation always available. Certain disadvantages in comparison with supervoltage X-ray machines lie in the necessity of replacing the cobalt source every few years, a somewhat lower radiation output which increases treatment times, and poorer definition of the beam edges due to relatively large source sizes. There is promise, however, of these disadvantages being ameliorated by the production of even more intense sources in the U. S. and Canadian nuclear reactors.

SUPERVOLTAGE THERAPY AT M. G. H.

The installation of a Cobalt 60 machine for therapy is but one step in a continuing sequence of advances at the M. G. H. in the technique of supervoltage therapy. In 1939, a new type of machine — the "pressurized" Van de Graaff generator, the first of its kind used for hospital equipment — was installed in the X-ray Department. It was designed to generate a million and a half volts and to produce a more penetrating X-ray beam than had hitherto been available. This pioneer machine was the result of intensive research and development at the Massachusetts Institute of Technology over several years. It has been a regular work horse in the Department and with it, over the years, thousands of cancer patients have been treated.

That machine, now 17 years old, has reached the end of a useful life, in addition to which technical advances in the generation of supervoltage X-rays have made it largely obsolete. Some of its work was taken over by a more modern Van de Graaff machine operating at 2 million volts, which was installed in 1948. Yet the number of patients with deep cancer who would be benefited or cured by X-ray therapy has continued to grow. Recently it became imperative that a reliable successor to this original machine be secured to act as a needed supplement to the 1948 machine. At this time, a newly designed Co 60 machine which seemed to meet our particular requirements came on the market. Largely because of its compact design, versatility, economy of operation and protection, it was decided to install one of these new units.

It should be emphasized that this new unit will accomplish no more and no less than the existing 2-million-volt X-ray machine — radiation from cobalt having the same desirable properties. Principally these are: (a) the improved tolerance of the skin compared with ordinary therapeutic X-rays, (b) the increased penetration of the body, (c) the reduced amount of scattering which keeps the beam narrowly confined to its initial direction, and (d) the low absorption in bone. The cobalt unit is a necessary supplement to the present treatment capacity of the Department and not a new approach to cancer treatment.

THE MGH COBALT UNIT ("BOMB")

The photograph on page 6 shows the unit now installed in the White Building. The radioactive cobalt metal in it weighs only about half an ounce, but so active is it that its radiation output is equivalent to about 2 pounds of radium, which is more radium than the amount in use in the whole of the U. S. A. The cobalt is in the shape of a very small pillbox, less than the width of a dime in diameter and about one-third of an inch high. The "bomb" in which the source is shielded is made of tungsten alloy and lead, and has a radial thickness of 8 inches. The total installed weight of the unit is 4500 pounds.

The unit is designed for rotational therapy of deep cancer. In this particular form of treatment, the patient lies supine on a light aluminum table and the source of radiation is moved on a circle around his body, so that the radiation beam is always passing through the cancer. In this way, a much greater treatment dose is delivered to the cancer than to the patient's skin (or other intervening tissues), since each individual skin area is irradiated for a relatively short time as the beam moves across it.

The rotation of the cobalt bomb is achieved electrically and is controlled from a panel outside the treatment room. Likewise, the movement of the tungsten shutter which exposes the patient to the radiation is controlled from this panel.

Radiation protection

The problem of radiation protection is an old one and well understood in X-ray departments. The introduction of intense sources of Cobalt 60 brings the problem into the foreground, because the radiation is ever-present and can never really be turned off as can an X-ray machine, and because of the highly penetrating nature of the radiation. The U. S. Atomic Energy Commission, which controls the production and distribution of all radioisotopes, has introduced special rigorous standards for installations of Cobalt 60. The shield surrounding the source must be designed to reduce leakage radiation to safe levels for radiology personnel who will be near the machine. Moreover, since during treatment an intense beam of radiation is released from the shield and is partially scattered in all directions, the treatment room itself must also be shielded to protect hospital personnel and the general public in the vicinity.

This situation illustrates another activity of the physicist in the atomic energy field. Having developed these intense radiation sources, he is called upon to solve the associated protection problem. In this case, the Atomic Energy Commission stipulates that a qualified radiation physicist shall design the protective walls of the treatment room and that subsequently he shall ensure by detailed measurements a safe radiation level around the installation. For the MGH unit, it has been the responsibility of the writer to satisfy these regulations.

The built-in protection afforded by the particular design of the cobalt machine we have secured is one of its most attractive features. On the far side of the patient, a large thick slug of lead is mounted, which absorbs most of the radiation emerging from the patient. The lead is mounted so that it moves around the patient with the cobalt source, being always diametrically opposite. (*See* photograph) This reduces drastically the amount of lead or concrete necessary in the walls and floor of the room. This feature alone has saved the Hospital many thousands of dollars in protection costs. Notwithstanding this, however, walls containing one inch or more of lead, or alternatively at least one foot of concrete, are necessary to shield the treatment room.

The cobalt unit, then, takes its place as an improved weapon in the fight against deep cancer and strongly reinforces the heavy artillery already available in the X-ray Department. It will enable us to treat more cancer patients than has ever been possible up to this time — and with the most modern techniques of radiation therapy.

Edward W. Webster, Ph.D.,
Physicist in Radiology

* * *

The Board of Trustees, at their meetings on July 20 and August 17, voted:

To accept the resignation of Dr. Robert C. Coe, effective July 31;

To accept with regret the resignation of Dr. Elbert P. Tuttle, Jr. from the position of Assistant in Medicine;

To grant Dr. Walter Bauer leave of absence from August 16 through November 30;

To grant Dr. Harriet L. Hardy leave of absence from November 1, 1956 through May 31, 1957;

To continue Dr. David B. Murray's appointment as First Assistant Resident in Pathology beyond June 30, until his induction into the Armed Forces;

To rescind the appointment of Dr. Anthony C. Allison as Assistant Physician and Assistant Pathologist, as Dr. Allison has decided not to accept this dual appointment.

To promote:

Dr. Aileen K. Adams from the position of Clinical Fellow to that of Assistant in Anesthesia, if and when she obtains a full Massachusetts license;

John M. von Felsinger, Ph.D. from the position of Associate Psychologist to Psychologist, as of July 1;

Dr. Paul C. M. Zamecnik to the position of Physician for the remainder of the Hospital year, effective July 1.

To appoint:

Dr. Richard C. Austin as Assistant in Surgery, beginning July 1;

Dr. Bernard D. Briggs as Assistant Anesthetist, for the month of July;

Dr. Donald J. Davis as Second Assistant Resident in Surgery, for the month of August;

Dr. Edward L. Ferguson as Second Assistant Resident in Surgery, beginning August 1;

Prof. Robert J. Hansen, Associate Professor of Structural Engineering at M.I.T., as Consultant in Biomechanics;

Dr. John J. Lorentz as Assistant in Physical Medicine;

Dr. John E. Mazuzan, Jr. as Assistant Resident in Anesthesia for one year, beginning December 1;

Dr. Thomas C. Peebles as a Dalton Scholar for four months, beginning July 1;

Dr. Ernest H. Picard as Third Assistant Resident in the Neurology Department, beginning July 1;

Dr. Walter T. St. Goar as Assistant in Medicine;

Dr. Porter H. Smith as Assistant in Anesthesia, beginning December 1;

Dr. Norman Trieger as Assistant Dental Surgeon, effective July 1;

Dr. Yang Wang as Resident in Medicine, beginning January 1, 1957.

At their meetings on August 8 and September 5, the General Executive Committee voted:

To accept the resignation of McIver W. Edwards, Jr., B.S. from the position of Research Fellow in Biochemistry, effective August 17, because of his call to active duty with the Armed Forces;

To accept the resignation of Dr. Charles H. Weed as Clinical Assistant in Medicine, with regret that it is necessary for him to resign at this time and with the assurance that if he wishes to apply for reappointment at some future time the Committee will be glad to consider his application;

That Dr. Joachim S. Gravenstein may continue to hold his appointment as Clinical and Research Fellow in Anesthesia at the Hospital coincidentally with his undergraduate work in Harvard Medical School;

To rescind the appointment of Dr. Willem deK. Kruger as Fellow in Anesthesia.

To extend the appointments of:

Dr. Howard J. Bagnall as Clinical and Research Fellow in Neurosurgery for one year, beginning September 22;

Dr. Fernando Rosas-Peña as Research Fellow in Neurology, from September 21, 1956 through March 31, 1957.

To reappoint:

Dr. Walter H. Caskey as Clinical Assistant in Medicine for one year, beginning May 1;

Dr. Adolfo C. Coussirat as Clinical Fellow in Anesthesia for one year, beginning September 1;

David M. Geller, Ph.D. as Graduate Student Assistant in Biochemical Research for one year, beginning September 30;

Dr. Cesare T. Lombroso as Clinical Fellow in Neurology for one year, beginning July 1;

Dr. William B. Looney as Clinical and Research Fellow in Medicine for one year, beginning September 19;

Dr. John F. McGinty as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning May 27;

Dr. George Martz as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Dr. Maurice M. Pechet as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Phillips W. Robbins, Ph.D. as Research Fellow in Biochemistry for one year, beginning September 1;

Dr. Albert O. Seeler as Clinical and Research Fellow in Medicine, assigned to Occupational Medicine, effective as of August 15;

Gene M. Smith, Ph.D. as Research Fellow in Anesthesia for one year, beginning September 1;

Dr. John B. Vander as Clinical and Research Fellow in Medicine for one year, beginning October 1.

To appoint:

Howard T. Blane, M.A. as Research Fellow in Psychiatry, beginning August 15;

Dr. Arthur E. Brown as Clinical Fellow in Medicine, beginning August 8;

Dr. Howard T. Hermann as Clinical Assistant in Psychiatry for one year, beginning August 1;

Dr. Bror-Axel Lamberg as Clinical and Research Fellow in Medicine, beginning October 1;

Dr. Ernest E. Musgrave as Clinical Fellow in Medicine, beginning August 20;

Joseph O. Wehrmüller, Ph.D. as Research Fellow in Medicine for one year, beginning October 1.

* * *

Seventeen eminent physicians, leaders in Pediatric Medicine, have announced the formation of the National Council on Infant and Child Care, Inc. The members of the Council, which is independent and nonprofit, are associated with more than a dozen medical schools and children's centers throughout the country. Dr. Allan M. Butler, Chief of our Children's Medical Service, will serve as President of the Council.

Dr. Butler says that the NCICC has been formed for the purpose of providing medical counsel in the utilization of mass media of communications. He explains that the program of the NCICC includes an information service for persons writing on medical subjects for newspapers, radio, television, and popular magazines. The NCICC will inaugurate awards for outstanding contributions to public understanding of matters pertaining to the health and welfare of infants and children.

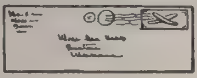
Dr. Butler announced that an NCICC Code for Advertising has been adopted to "encourage truthful, informative promotion of products that are important to child care." The Code will be available to manufacturers of medical and nutritional products, to assist them in conducting their promotion along lines that would provide factual information to the public and would encourage the patient's trust and confidence in his physician.

Dr. Butler also described the NCICC Editorial Guide which, he said, had been prepared to promote accurate public understanding of developments in the field of pediatrics.

The NCICC is supported by financial grants from interested business and other organizations.

In addition to Dr. Butler, outstanding physicians from all over the United States will serve as officers, board of directors, and members of the organization. Dr. James R. Wilson of Winnetka, Illinois, lecturer in the Department of Food Technology of M. I. T., is consultant to the group.

The NCICC has established headquarters in the New York Academy of Sciences Building, 2 East 63rd Street, New York City. Dr. Margaret Lyman, former research fellow of the U. S. Public Health Service in the Department of Pediatrics at the State University of Iowa, has been appointed educational director and will devote full time to this function.



New addresses:—

Dr. Richard C. Austin (*S.* 1951), Concord Medical Center, Concord, Mass.
Dr. Crawford S. Brown (a.r.p. *D.* 1952), 541 W. Roses Rd., San Gabriel, Calif.

MASSACHUSETTS EYE & EAR INFIRMARY

GLAUCOMA CONSULTATION SERVICE

Glaucoma is a disease characterized by abnormally high pressure within the eyeball; if the pressure is allowed to remain too long at excessive levels, irreversible changes are wrought in nerve fibres leading from the retinal percipient elements toward the visual cortex of the brain, and vision is permanently lost in proportion to the extent of such pressure-induced damage.

Glaucoma occurs in individuals of all age groups — newborn to nonagenarians. Its greatest incidence is in people over 40; certain surveys have shown that 1½ to 2½ percent of all persons over 40 in the United States have the disease. Unhappily, the commonest form of primary (cause unknown) glaucoma usually produces no symptoms, and is picked up when the patient is seen for a routine change of glasses or for some relatively unimportant complaint; pressure is often difficult to control in this type of chronic glaucoma. The acute form of primary glaucoma, on the other hand, is apt to make the patient consult his oculist early because of pain, or blurring of vision, or rainbows around lights; this type is sometimes easy to treat surgically, often with promise of complete cure. There are many types of (secondary) glaucoma which have a variety of recognized causes; some of these stimulate the patient to seek immediate advice, others do not. Some are easy to treat, others are not.

In 1948, Dr. W. Morton Grant, Associate Professor of Ophthalmic Research in the Howe Laboratory, Harvard Medical School, devised a technique known as tonography, which consists of the external application to the eye of an electronic pressure-measuring device which in turn is connected to a recording galvanometer. By this means a graph may be obtained showing intraocular pressure change resulting from application of the instrument to the eye for a period of four minutes. Under the weight of the instrument, pressure falls more readily in the normal than in the glaucomatous eye. After several hundreds of eyes had been measured tonographically, criteria were established which permit this procedure to serve as a diagnostic test in glaucoma suspects, and in certain obscure cases which were heretofore diagnostically difficult.

Tonography seems to indicate that intraocular pressure in glaucoma is elevated because the eye is unable to rid itself of aqueous humor normally. Previously it was thought that excessive production of aqueous humor was responsible for excessive intraocular pressure. Thus tonography, originally evolved as a research tool, has added something to the backlog of information which will one day permit greater understanding of the nature of glaucoma.

During the development of tonography, hundreds of patients, both clinic and private, were sent to the Howe Laboratory for evaluation. The patient and referring physician often benefited by consultation, and Dr. Grant benefited by clinical material from which to accumulate data. Other techniques previously used here and elsewhere — such as gonioscopy, and water drinking, and mydriasis tests — now began to be widely used in the Howe Laboratory in conjunction with tonography, and thus was developed a set-up for complete investigation of glaucoma patients and those suspected of having the disease.

The most spectacular development in the medical treatment of glaucoma in several decades has been the use of acetazoleamide (Diamox, Lederle). Some of the earliest definitive investigative and clinical work with this drug was carried out in the Howe Laboratory by Drs. Grant and Robert R. Trotter, starting in October 1953. A carbonic anhydrase inhibitor, Diamox reduces intraocular pressure presumably by diminishing the formation of aqueous humor (in contradistinction to the miotics — drugs used topically to reduce intraocular pressure by improving the ability of the glaucomatous eye to rid itself of aqueous humor). Tonography has been helpful in clarifying the mechanism of action of both Diamox and the miotics.

After tonography had been developed into a somewhat precise procedure, the tonographic evaluation of glaucoma patients no longer was appropriate as an activity of the Howe Laboratory, which is oriented toward basic research. Since such glaucoma study appeared to be diagnostically beneficial to the patient and the consultative function welcomed by the visiting staff, the Board of Surgeons saw fit to establish on July 1, 1955, the Glaucoma Consultation Service, which was put in charge of Dr. Robert R. Trotter and set up near the Eye Clinic where its facilities could be available with least confusion to Clinic patients. This new organization is intended to serve as a teaching facility through which house officers rotate for three months; its function is advisory and consultative. The Glaucoma Consultation Service is not intended to give total eye care to glaucoma patients, nor to control their care, whether medical or surgical.

There are about 2,000 glaucoma patients actively attending the Eye Clinic. The roster, of course, is constantly changing because of death, family relocation, or improvement in family financial resources. But the absolute number of glaucoma patients is growing and presumably will continue to do so as longevity increases generally. With increased longevity, patients will have more years during which glaucoma damage will become more severe, and it is therefore likely that more and more blindness will result from this disease unless more awareness on the part of the public is cultivated, and unless the general care of glaucoma patients improves.

Functions of the Glaucoma Consultation Service as it is presently constituted are:

1. To apply, on request from Eye Clinic or private physician, tonography, gonioscopy, or provocative tests in order to prove or disprove a tentative diagnosis, or to clarify the status of a patient in whom glaucoma is known definitely to be present.

2. To advise on medical or surgical measures on request of the referring physician.

3. To supervise the glaucoma follow-up worker whose duty is to keep track of Clinic patients who fail to keep appointments.

4. To provide an investigative pool in which promising new therapeutic or diagnostic procedures may readily be evaluated.

5. To afford concentrated training to house officers in diagnostic techniques and in the handling of glaucoma patients. The same opportunities for learning are available to fully-trained ophthalmologists who wish to make use of them.

Dr. Pei-Fei Lee of Taipeh, Taiwan (Formosa) is now working as a Fellow in Ophthalmic Research in the Glaucoma Consultation Service. One of his projects is tonography of eyes prior to cataract extraction and thereafter, in an attempt to clarify the causes of choroidal separation in the immediate postoperative period following cataract extraction. He is supported by the U. S. P. H. S.

Dr. Baruch J. Sachs, the first house officer to rotate through the new Service, has been working on tonography before and after the instillation of a cycloplegic in normal and glaucomatous eyes, in an effort to elucidate the mechanism by which certain cycloplegic substances appear sometimes to bring about rises in intraocular pressure.

It is expected that the Glaucoma Consultation Service will eventually upgrade the care of glaucoma patients in our Eye Clinic by providing closer supervision of their treatment, even though the supervision is indirect. Development is under way on a new method of record-keeping for glaucoma patients; this would eliminate much of the prolonged leafing-through by a doctor new to a particular patient in order to familiarize himself with the record — a process which presently makes the handling of glaucoma patients very time-consuming in the Eye Clinic. Such an innovation in the record-keeping system would not be incompatible with the present MGH-MEEI unit record system, but should supplement it in helpful fashion.

Thus it is hoped that glaucoma patients may some day be processed more speedily, cutting down their waiting time in the Eye Clinic. These are the greatest body of repeating patients in the Eye Clinic; it is well recognized that expediting their handling will encourage their cooperation in following the treatment routine prescribed for them. Not only are many of the glaucoma patients elderly, but many also seem to be tense and easily upset by prolonged waiting which has been the rule rather than the exception. There are being explored other possibilities for cutting waiting time for glaucoma patients.

Closer liaison with the Social Service Department has resulted from establishment of the Glaucoma Consultation Service. A glaucoma case worker, Mrs. Stella Cantor, has been attached to work with us and with the gaucoma follow-up worker. Thus glaucoma patients, ambulatory or hospitalized, who have non-ocular problems interfering with their eye care can be brought readily to the attention of Mrs. Cantor, who is often able to render assistance of great value in promoting successful treatment.

Quarters at present are one room; this is highly inadequate because of the lack of privacy and quiet necessary for satisfactory tonography and for other reasons. Discussions are under way looking toward the acquisition of additional space.

The potential usefulness of the Glaucoma Consultation Service can hardly be overestimated, especially in view of the unique position of the Eye and Ear Infirmary in the New England area. The Service has an opportunity and an obligation to stimulate physicians to make earlier diagnoses of glaucoma, to educate the public concerning the disease, and to aid in revising upward the standards of glaucoma treatment by teaching. Not the least of our opportunities is that concerned with further clinical investigation of glaucoma in conjunction with basic discoveries emanating from the Howe Laboratory. Whether or not we will succeed in this ambitious program only the passage of time will reveal. If we succeed, the foresight of Dr. Dunphy and the Heads of Service in establishing the Glaucoma Consultation Service will be apparent.

Robert R. Trotter, M.D.,
Assistant to the Chief of Ophthalmology

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the Office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material*, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Limiting factors in experimental pain.
J. Chron. Dis. 4:11-21.

Beecher, H. K.
Relationship of significance of wound to pain experienced.
J.A.M.A. 161:1609-1613.

Briggs, B. D., Sheldon, D. B., and Beecher, H. K.
Cardiac arrest: Study of a thirty-year period of operating room deaths at Massachusetts General Hospital, 1925-1954.
J.A.M.A. 160:1439-1444.

Dermatology

Reznick, L., Lever, W. F., and Frazier, C. N.
Treatment of pemphigus with ACTH, cortisone and prednisone: Results obtained in twenty-five cases over a period of five years.
New England J. Med. 255:305-315.

Laboratory Science

Matoltsy, A. G.
Human epidermal cells in tissue culture.
Transplantation Bull. 3:99-100.

Matoltsy, A. G.
Sedimentation studies of epidermal keratins. Keratin A and keratin B.
J. Biophys. & Biochem. Cytol. 2:361-363.

Proctology

Speare, G. S.
Anorectal disease in the community: With special reference to detection of rectal cancer
New England J. Med. 255:377-379.

Psychiatry

Sifneos, P. E. (Editor)
Clinic on psychosomatic problems: Long-term psychotherapy in a patient with epigastric pain.
Am. J. Med. 21:275-281.

◆ ◆ ◆

From August 27 to September 5, the Somerset Hotel in Boston was the headquarters of the largest meeting of hematologists and blood transfusion specialists which has ever been held.

First, there was the meeting of the Fifth International Congress of the International Society of Hematologists, under the presidency of Dr. William Dameshek. Hematologists from all over the world participated in this meeting, and 710 papers on all the different aspects of hematology were presented. Thanks to Dr. William H. Baker of the Massachusetts General Hospital, who was Chairman of the Communications Committee, a very successful arrangement was made with the I. B. M. people and translators whereby it was possible to follow all the scientific papers in English, French, or Spanish.

An extremely interesting program on leukemia, hemorrhagic disorders, anemia, and nucleonics was presented during the week, finishing up with one day of immunohematology, which brought about a natural continuation into the following meeting of the International Society of Blood Transfusion and the Ninth Annual Meeting of the American Association of Blood Banks, under the presidency of Drs. I. S. Ravdin and J. J. Griffitts.

An extensive program of special events was arranged, starting Monday evening, August 27, with the official Congress reception. A cocktail-supper at the Museum of Fine Arts was the beginning of all the pleasant and, as for every International Congress, important social gatherings which took place during the 10 days of the meeting. As has been the experience in several Congresses in Europe, a museum with all its beautiful displays of art presents itself as an ideal background for an official Congress reception.

Wednesday afternoon the delegates had the opportunity of enjoying an excellent New England clambake, which had been expertly organized by Drs. Daphne and Allan Richardson Jones. In busses and cars, about 800 delegates and their wives were transported along the North Shore to Castle Hill in Ipswich where the clambake was served. This was followed by a fine outdoor concert, in which Mme. Jacqueline Latarjet of Paris, wife of one of the delegates, was among the soloists who entertained the group.

Friday evening, following a cocktail-reception at the Harvard Club, the official banquet of the Hematology Congress took place in the Louis XIV Ball Room at the Somerset Hotel.

The new president of the society, Dr. Giovanni DiGuglielino, announced that the next Congress will take place in Rome, Italy, in 1958. Following other official speeches, a dance was held for the delegates and their wives.

Over the week end a large group of the American hematologists left Boston and were replaced by the new group of blood transfusion delegates who came from all over the country. Most of the delegates who had come from other countries stayed over for the Sixth Congress of the International Society of Blood Transfusion and the Ninth Annual Meeting of the American Association of Blood Banks, which lasted from September 3 to 5.

Again, a very interesting scientific program, with 141 papers, was arranged for the delegates. The program consisted of presentation of the latest news in immunohematology, blood preservation, platelet and platelet derivatives, as well as hemolytic diseases of the newborn.

Also for this meeting an extensive program of special events was arranged, starting with a cocktail-supper reception at the Harvard Club on Sunday evening, followed by an official banquet on Tuesday evening, September 4. During this banquet the annual awards of the American Association of Blood Banks were presented. Dr. Philip Levine and Dr. Alexander Wiener received the Karl Landsteiner Award for their contribution in the field of blood group immunology, and Dr. Garrett Allen of Chicago received the John Elliott Award for his research work in connection with long-time storage of plasma at room temperature for the purpose of preventing transfer of serum hepatitis.

On Wednesday, September 5, the final papers were given, the meeting was brought to an end, and a group of exhausted Boston physicians could return to their laboratories and offices with the good feeling, I believe, that the meetings had been in every way successful and gratifying.

As usual, it was a very pleasant experience to meet with one's valued friends from all over the world. Fortunately, quite a number of them are still visiting with us.

Morten Grove-Rasmussen, M.D.,
Director, MGH Blood Bank

[Dr. Grove-Rasmussen has been elected Vice-President of the American Association of Blood Banks.——*Editor*]

Brief bits:—

After attending the conference of the American College of Surgeons in San Francisco, Dr. Oliver Cope will fly to Mexico City to give an address on "Adrenal surgery" at the celebration of the Tenth Anniversary of the Hospital de Enfermedades de la Nutrition on October 11.

Dr. Edwin O. Wheeler, who has been on leave of absence with the U.S. Public Health Service for the past eighteen months, has completed that service and is now back with our Cardiac Unit.

BIOGLETS

Dr. Carl N. Brownsberger, Assistant Resident in Medicine—born in India, May 11, 1930; grew up in Glendale, California; B.A., Yale University, 1951; M.D., Harvard Medical School, 1955; Intern IV Medical (Harvard) Service, Boston City Hospital, 1955-56; married.

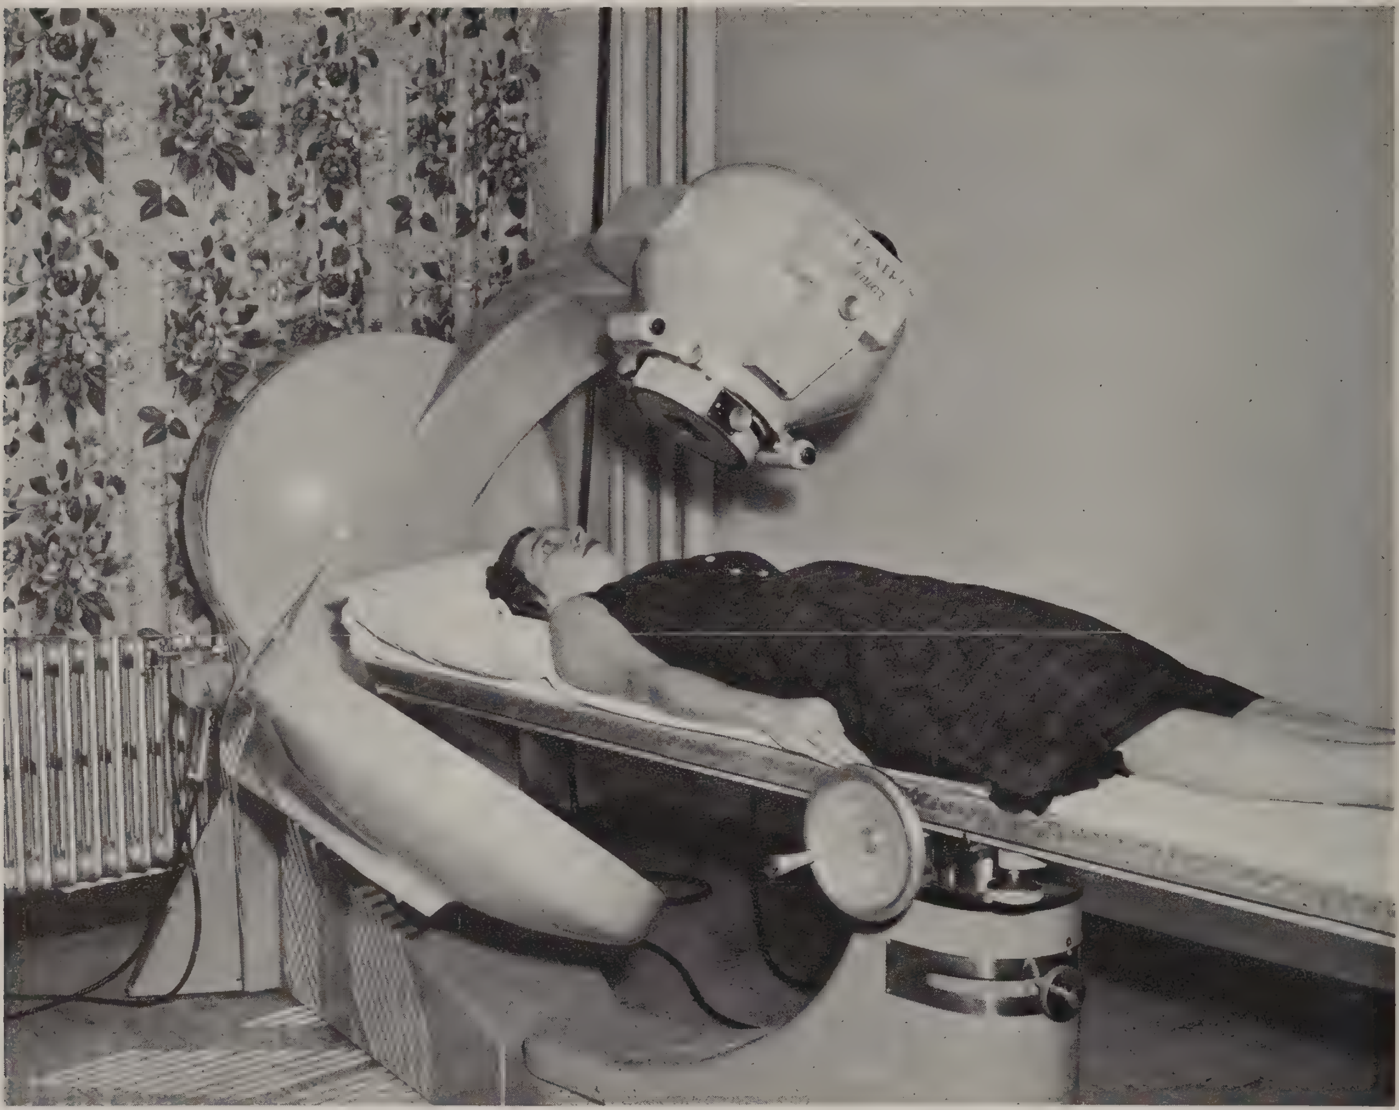
Dr. Richard F. Mayer, Assistant Resident in Neurology—born in Olean, N.Y., June 2, 1929; B.S., St. Bonaventure College, St. Bonaventure, N.Y., 1950; M.D., University of Buffalo School of Medicine, 1954; Intern in Medicine, Boston City Hospital, 1954-55; Fellow in Neurology, Mayo Foundation, University of Minnesota, Minneapolis, 1955-56.

Dr. William M. Thurlbeck, Assistant Resident in Pathology — born in Johannesburg, South Africa, September 7, 1929; B.Sc., 1949, M.B., Ch.B., 1953, University of Cape Town; Intern, Groote Schuur Hospital, Cape Town, 1954; Junior Registrar, Pathology Department, University of Cape Town, 1955; married; home: Cape Town, South Africa.

The Union of South Africa is a member of the British Commonwealth, is about twice the size of Texas, and has a population of some 14 million. About 2½ million of these are white, 1 million are of mixed blood or Asiatics, and about 11 million are Africans, i.e., negroes. About 60% of the whites are of Dutch extraction. They speak Afrikaans chiefly—a language peculiar to South Africa. The remainder of the whites are English-speaking.

At present there are 3 medical schools graduating students as doctors. The University of Cape Town and Witwatersrand University in Johannesburg are English-speaking schools, each with a class enrollment of about 110, of which some 20 are colored. The University of Pretoria is Afrikaans-speaking, graduates 50 students yearly, and is a segregated white school. A similar school exists at Stellenbosch University, and its first students will graduate in 1961. The University of Natal at Durban is a segregated school for coloreds, and its first students will graduate in 1959. The medical schools are modelled on the British schools. Students may enter medical school directly from high school and spend 6 years in training. However, about half of the students take some other degree before starting their medical training. The first year subjects are physics, chemistry, botany, and zoology. Anatomy, physiology, pathology, pharmacology, and an introductory course in clinical medicine occupy the second and third years. The last 3 years are spent in hospital training, with rotation through the various clinical departments, supplemented by regular — too regular — lectures to the whole class. The standard of medical training is probably equal to that of the English provincial medical schools.

Postgraduate training, also, is modelled on British lines. Some 25% of the graduates intern in a university hospital. About a fifth of these become the equivalent of residents and are called registrars. The time requirement for specialist training is longer, but it is not as carefully organized as here. The salaries are adequate and a long period of specialization is not a financial burden. The nature of the selection at intern and registrar levels ensures a fairly high standard of intellectual attainment. The majority of budding specialists go to England for a while and usually take a postgraduate degree there. Only a small number come to the United States, chiefly because of the expense and the difficulty of sterling-dollar conversion. Once properly qualified, the prospective specialist's credentials are examined by a government body —the South African Medical and Dental Council—and, if approved by them, he is entitled to charge higher fees and rise to a higher scale in government (Federal) and provincial (State) services. The percentage of certified specialists is low, and much work is done by general practitioners that would have a far happier



Our new "Theratron Junior" Cobalt 60 unit, ready for use in treatment of a malignancy in the larynx. Miss Glenn MacKenzie, Secretary in Radiation Therapy, posed for us as "the patient".

result in the hands of competent specialists.

The racial policy of the country produces a small fee-paying population and a large population unable to pay for adequate care. The white community is served by a system similar to that practised here, although it falls a good deal short of the efficiency of American medicine. Private practice exists to a limited extent in the non-white communities, but the patients generally can pay no more than office consultation fees and the bulk of the care of this group is in the hands of the provincial hospital services. Each of the 4 provinces has its own system which provides free care for those with incomes below a certain level. The doctors in these hospitals are full-time employees of the province concerned. The government hospital service provides free treatment and hospitalization for certain diseases, notably tuberculosis, venereal diseases, and mental disorders. The medical school hospitals are administered jointly by the province and the university concerned, and the majority of the staffs are full-time employees of the province. This produces the anomaly that to get the best available medical care one has to earn less than a stated amount.

There are few diseases peculiar to South Africa, but 2 notable examples are onyalai, a variant of thrombocytopenic purpura, and "nutritional heart disease", a form of idiopathic cardiac failure unrelated to beriberi. A number of nutritional diseases are seen relatively frequently, and scurvy, pellagra, beriberi, and kwashiorkor are not uncommon. Certain infectious diseases, such as tuberculosis, typhoid, schistosomiasis, and amebiasis are relatively common. Only part of the country has a subtropical climate and true tropical diseases rank among the exotica, but are seen occasionally. Other diseases have a varying and interesting racial incidence. Poliomyelitis, malignant lymphomas, coronary heart disease, diabetes mellitus, peptic ulceration, and appendicitis are rare in the African. Gout is almost unknown. An interesting genetic and anthropological fact is the low incidence of the sickle cell trait south of the Limpopo, as opposed to its incidence in the negro elsewhere. Kaposi's sarcoma, hypertension, melanocarcinoma, porphyria, and primary carcinoma of the liver are relatively common in the African.

This varying incidence of disease provides a fertile field for epidemiologic research, and it is a pity that there are only limited funds and personnel available. There is a fascinating and complicated background of nutrition, genetics, infection, and untold factors yet unexplored. A recent example of such research was the investigation of the racial incidence of coronary heart disease carried out by Bronte-Stewart, Brock, and Keys. The older work of Berman on liver cancer and of the Gilmans on cirrhosis and cytosiderosis is also worthy of mention. One feels that efficient research would lead to a much better understanding of the etiology and pathogenesis of many diseases of world-wide distribution.

William M. Thurlbeck, M.D.,
Assistant Resident in Pathology

♣ ♣ ♣

The July-August issue of The News reported the resignation of the Reverend James H. Burns as Protestant Chaplain to the Massachusetts General Hospital, and gave an outline of Mr. Burns's professional background and experience.

On the morning of August 31, a delightful coffee party was given in his honor in the Baker Lounge. Scores of Mr. Burns's friends came to express their appreciation of his services at the Hospital and to extend good wishes for his happiness and success in his future work as Head of the Departments of Social Relations and Pastoral Services of the Massachusetts Council of Churches.

THE NEWS

1811

No. 161 Boston, Mass. NOVEMBER 1956

DENTAL SERVICE AFFAIRS

The peculiar environment of the oral cavity controls to a great extent the early development in the soft tissues of the signs and symptoms of generalized disease. Because of the accessibility of the oral cavity, useful information may be obtained by examination of this area. To this end, emphasis has been placed on this aspect of mouth disease in the Dental Clinic. A sizable collection of data has been accumulated during the past several years. This material probably now represents one of the most comprehensive studies of mouth disease in this country. Frequently some of these findings have been presented to graduate dental as well as medical groups in various parts of the United States. The continued reputation of this Hospital to attract the oddity as well as the common, and the interest and training of the dental staff has made possible the collection of these data.

Most of the patients seen in our Out-Patient Department are adults. Consultation with the Medical Service is desirable. Proximity of the consulting service is important. The Dental Clinic is adjacent to the Medical Clinic and has been so situated for many years. However, when full-time staff members in both clinics became available, the freedom of consultation resulted in better ambulatory care for our patients. The inevitable benefit was better teaching and training for students and interns.

The number of patients in the Dental Clinic has been maintained at a good level. The number of patients admitted to our service in White and on the private floors was approximately 400 for the past year. Consultations on other services average about 300 for a year. Our number of fractured jaws treated is increasing. This past year we have had 40 admissions for treatment of fractures. All of these available experiences have made the internship attractive to graduates of dental schools in this country and we have been able to attract an excellent group of applicants.

Investigative activities have increased. Dr. Norman Trieger, a full-time member of the staff at the Hospital and an Instructor in Oral Medicine at the Harvard School of Dental Medicine, has been doing some studies on abnormal bleeders. Regardless of normal laboratory findings, one of the certain methods of determining abnormal bleeding is to carry out oral surgical procedures. Dr. Trieger, in collaboration with Dr. Joseph J. M. McGovern on the Pediatric Service, has recently published some studies on abnormal bleeding following tooth extraction. Dr. Trieger, through the offices of Dr. Benjamin Castleman, has been cataloguing oral surgical material in the Department of Pathology. This material should be of great assistance in the training of general pathologists as well as our own interns and students. Dr. Trieger has just completed the study of material on salivary glands and has collected this in the form of a monograph. It includes clinical findings, X-ray contrast studies, microscopic material, and references to the literature. Our interest in salivary gland disease is continuing. Because of some suspected abnormality of parasympathetic function, clinical trials with long-acting cholinergic drugs are in progress. Electrophoretic patterns of proteins of saliva are being studied on patients having diseases of the salivary glands. This study is being done at the Harvard School of Dental Medicine laboratory.

Our interest in precancerous lesions of the oral mucosa has been stimulated further, recently, by a two-year grant from the United States Public Health Service. The glycogen metabolism of human material has been studied by means of slice techniques. Our most recent finding, using C-14 labeled glucose, has demonstrated the ability of oral mucosa to synthesize glycogen. There is also some evidence suggesting that, clinically and microscopically, normal mucosa adjacent to leukoplakia shows some abnormality in glycogen concentration. This latter finding will be studied further. Because of our close association with the Tumor Clinic, most of the clinical material is obtained there.

Last but not least, the Dental Service was asked to assist in an emergency arising in some 30 polio patients last winter. Much time had passed since their admission. The teeth of most of these patients had become carious and in some instances rampant decay had occurred. All of these patients required restorative dental treatment. Many of them could not be removed from the respirators for long periods. All these patients could be transported only with great difficulty to dental offices. Our own Dental Clinic has never been equipped for restorative dental treatment, and our staff members have never been called upon to render this type of service in the Hospital. However, to meet this emergency the dental staff volunteered to care for these patients. Through the efforts of Miss Ruth M. Farrisey, R.N., Executive Officer for MGH Clinics, some equipment and supplies were obtained. Our staff members brought their own special equipment, and all of the polio patients were cared for. At least two lessons have been learned from this experience. One is the importance of planning for total care for patients, and the second lesson is the importance of being surrounded by a loyal and devoted staff. These men should be congratulated.

David Weisberger, D.M.D., M.D.,
Chief of Dental Service

* * *

Dr. Herbert E. Kaufman, Intern in Medicine, was awarded a prize at the annual meeting in September of the New England Society of Pathologists, as one of two winners who submitted papers on Pathology, in a contest sponsored by the Society, for medical students.

* * *

On October 5 a giant Red Feather flag was raised above the White Building, identifying the Massachusetts General Hospital as one of the 277 Red Feather agencies of Greater Boston that benefits substantially from the Community Fund.

On October 15 the 1957 MGH-Red Feather campaign was launched. I urge you to get behind the hard-working committee and the 350 solicitors in their effort to achieve—or exceed—the MGH quota of $9,750, our share toward the total Campaign goal of $6,567,000. The MGH quota this year, unlike those of previous years, excludes the Visiting Staff since they are to be solicited separately. This means we need redoubled efforts on the part of the rest of us.

The 1957 MGH-Red Feather Campaign Committee is headed by Mr. Joseph W. Degen and Mrs. Soma Weiss, co-chairmen, assisted by four vice-chairmen — Miss Louise Hatch (Gold Division), Dr. John W. Littlefield (Red Division), Miss Ruth Sleeper (Blue Division), and Miss Miriam Huggard (Displays).

It has been truly said, "Our eyes see and our hearts tell us that many of our neighbors need assistance, and we are aware that there are thousands more in need whom we cannot reach personally." Surely we who work in a hospital know this to be true. We also know that we can help these people through the United Community Fund. I urge you to give to the 1957 Red Feather Campaign — to give thoughtfully and generously.

Dean A. Clark, M.D.,
General Director

The Board of Trustees, at their meetings on September 7 and 21, voted:

To promote:

Dr. John A. Mannick to Third Assistant Resident in Surgery, beginning October 1;
Dr. Edwin W. Salzman to Third Assistant Resident in Surgery, beginning October 1.

To reappoint:

Dr. John D. Constable as Second Assistant Resident in Surgery, beginning September 1;
Dr. Donald J. Glotzer as Second Assistant Resident in Surgery beginning September 15;
Dr. Charles E. Huggins as Second Assistant Resident in Surgery, beginning September 1;
Dr. Herbert L. Kraut as Assistant Resident in Dermatology, beginning January 1, 1957;
Dr. Donald N. Wysham as Assistant Resident in Medicine, beginning February 1, 1957.

To appoint:

Dr. Morris H. Adler as Attending Psychiatrist at McLean Hospital;
Dr. Herbert S. Cline as Clinical Assistant in Psychiatry at McLean Hospital;
Dr. Jeannette A. Hovsepian as Second Assistant Resident in Radiology, beginning July 1, 1957;
Dr. Mary L. Scholl as Assistant Physician to the Children's Medical Service;
Dr. Maurice Vanderpol as Assistant Psychiatrist at McLean Hospital.

At their meetings during September and on October 3, the General Executive Committee voted:

To accept the resignation of:

Dr. Bryan Williams, Jr. from the position of Clinical Assistant in Medicine, assigned to Cardiology, as of October 15, with thanks for his valuable services during the absence of Dr. Wheeler.

To promote:

Dr. James F. Donovan to the position of Senior Resident on the Orthopedic Service for the period October 1, 1956 through December 31, 1957.

To extend the appointments of:

Dr. Howard S. Cameron as Assistant Resident on the Orthopedic Service from October 8 through December 31, and that he be promoted to Senior Resident for the term January 1 through June 30, 1957;
Werner Ritschard, Ph.D. as Research Fellow in Biochemistry, through November 30.

To reappoint:

Dr. Leo J. Cass as Clinical Assistant in Medicine for one year, beginning May 1;
Heinz Kohler, Ph.D. as Research Fellow in Biochemistry for one year, beginning September 1;
Mr. Alden V. Loud as Research Fellow in Medicine for one year, beginning July 1;
Audrey S. Mishler, B.S. as Research Fellow in Psychology for one year, beginning September 1;
Richard R. Peebles, Ph.D. as Research Fellow in Psychology for one year, beginning September 1;
Dr. John H. Sisson as Clinical Assistant in Medicine for one year, beginning May 1;
Dr. Ingrid Sondergaard as Clinical and Research Fellow in Psychiatry for one year, beginning October 15;
Dr. Edward J. Welch as Clinical Assistant in Medicine for one year, beginning May 1;
Babette S. Whipple, Ph.D. as Research Fellow in Psychology for one year, beginning September 1.

To appoint:

Prof. Eugene Bell, M.Sc. as Research Fellow in Biology, in the Department of Neurosurgery;
Dr. Richard B. Gresham as Clinical Fellow in Orthopedic Surgery, for the period October 1 through December 31;
Dr. Anthony J. Leonsins as Clinical and Research Fellow in Surgery for one year, beginning October 1;
Dr. Gilles G. C. Lyon as Clinical and Research Fellow in Neurology for one year, beginning October 1;
Dr. Chung H. Lyou-Kim as Clinical Fellow in Pediatrics, for the period September 4, 1956 through February 28, 1957;
Dr. Reginald S. Rilling as Graduate Student Assistant in Orthopedic Surgery, for the period September 4 through September 29.

MASSACHUSETTS EYE & EAR INFIRMARY

THE MICROCIRCULATORY LABORATORY

Microcirculation is related to observation of microscopic arterioles, capillaries, and venules and to the study of their functions. The main purpose of the Microcirculatory Laboratory is to learn more about the exchange of substances between circulating blood and the cells of living tissue. Such a concept is broad because cellular and humoral physiology is involved and it must, therefore, be approached by multiple routes. Anatomical, physiological, physical (such as electronics), and biochemical studies are all indicated, and require collaborative efforts with a number of laboratories located in the Massachusetts General Hospital, the Massachusetts Eye and Ear Infirmary, Harvard University, and the Massachusetts Institute of Technology. The Microcirculatory Laboratory, therefore, is well located.

This laboratory, like all others, started because someone had an idea. In 1948 Dr. Francis M. Rackemann felt that the Allergy Laboratory should engage in more kinds of basic investigation. He and Dr. Walter S. Burrage discussed the matter with Dr. Cecil K. Drinker who recommended the study of small blood vessels. Dr. John W. Irwin was sent to South Carolina to study under Dr. Melvin H. Knisely, who had devised the quartz-rod method of transillumination of living tissue and who is recognized for his studies of the circulation of the liver and the spleen. Dr. Irwin remained there for a year, and when he came back in the fall of 1950 a corner of the Allergy Laboratory on Domestic 5 was given over to the project. It was decided to observe the small blood vessels of the lungs of living mammals both before and during anaphylaxis. Equipment was difficult to secure because of the Korean War, and no funds were available. However, Dr. Burrage was successful in solving both problems, and work was under way within a few weeks. The early work showed that in anaphylactic shock in the guinea pig the blood vessels were involved quite as much as were the bronchial muscles, and that was an important advance in knowledge. Slowly the method and the findings attracted attention. In 1952 Dr. Francis L. Weille became interested in these techniques, and he considered that the method might be used to learn more about the circulation in regard to the spiral ligament in the cochlea of living guinea pigs. The projects gained impetus, and soon equipment filled the laboratory to such an extent that one had to thread one's way about the room. When the Massachusetts Eye and Ear Infirmary started new construction on its research wing, Dr. LeRoy A. Schall designated space for the Microcirculatory Laboratory. Movement of equipment to the new quarters on the fourth floor of the Massachusetts Eye and Ear Research Building commenced in late February 1956 and was completed by mid-July. These laboratory facilities are modern and designed for the studies at hand. Such excellent facilities are not only inspiring, but are greatly appreciated.

From 1950 to 1954 the vascular patterns of the small blood vessels of the lungs, the liver, and the cochlear spiral ligament of living mammals were studied with the aid of microscopes. It became apparent, at least under the experimental conditions, that blood flow was intermittent in any specific vessel of all these organs and that these small vessels all had the capacity to change the diameters of their lumina. During active anaphylaxis, changes in the calibers of vessels as well as alterations in the intravascular cellular elements were noted. It was possible to record observations on motion picture film, which has been used for several short movies. In 1955 the laboratory was asked to prepare an exhibit demonstrating the circulation of the spiral ligament for the Scientific Exhibits at the annual meeting of the American Medical Association. Our Art Department prepared the exhibit. The Certificate of Merit for its section was awarded, much to the satisfaction of all.

Since 1954 the hemodynamics of the pulmonary vascular system have been under investigation. Dr. Maurice B. Rappaport of the Sanborn Company redesigned a standard electromanometer which permits accurate measurements of both the systolic and diastolic pressures of the small pulmonary blood vessels. He donated his time very generously in instructing us in its use as well as in the use of the recording instruments. Without his constant aid it would not be possible to maintain the equipment in first class condition. By recording pressures of the carotid artery with large-bore cannulas as well as with micro-quartz cannulas, it was possible to show that pressures obtained with the micro-quartz cannulas were valid. These micro-cannulas have tips with an internal diameter of about 20 micra (1 micron=1/1000 of a millimeter). For comparison, a 25-gauge needle has an internal diameter of 0.3 of a millimeter. In other words, the micro-cannula is about 17 times smaller than the 25-gauge needle. Much time has been consumed in developing techniques which enable one to insert the tip (20 micra) of the micro-cannulas into the lumina of the small pulmonary blood vessels. All problems are not solved as yet, but some blood pressure curves have been recorded. Once the techniques are perfected, it should be possible to collect data of considerable interest.

The inner ear of mammals is a fascinating organ. Many of its secrets are still well guarded. The organ of Corti has not been proved to have any direct blood supply. It is bathed in endolymph whose exact origin is not known. Two groups of experimenters have found that the electrolytes of endolymph are present in the same concentrations as in intracellular fluid. In addition, the organ of Corti is one of the most active tissues of the body. The possibilities of fruitful investigation in this area appear great.

To date, techniques have been developed to expose the cochlea of a living guinea pig. In addition, a fenestration of about 250 micra is made in the bone over the scala media of one turn of the cochlea. The spiral ligament lies just under this bone. It has been possible to define with accuracy the vascular patterns of the spiral ligament. The question arises as to whether the endolymph is derived from the stria vascularis (capillaries in the spiral ligament) or from some other source. Pressure measurements of the spinal fluid and the endolymph of living animals are being made. Perhaps it will be possible to record the blood pressure within the capillaries (stria vascularis). Once valid data are secured, the pressure gradient may well give an indication as to the site of origin of endolymph.

Other irons are in the fire. In conjunction with the Acoustics Laboratory of the Massachusetts Institute of Technology, the so-called "floating room" (free of most vibrations and sound) will be staffed and equipped to study the microphonics of the inner ear of living mammals. Two fenestrae (each about 30 micra in diameter) will be made in the bone of the cochlea overlying the scala media and scala tympani. Through these windows minute microelectrodes will be inserted into the endolymph and perilymph. Dr. Moses H. Lurie's laboratory is equipped to check with serial sections of the cochlea the histological results of the experiments.

On the planning board are other experiments. It is hoped to develop a biochemical laboratory equipped with microtechniques which will facilitate the measurements of many of the substances in the endolymph. Such data may throw some light on the ability of the organ of Corti to function so well without a direct blood supply. If endolymph proves to be similar to intracellular fluid, the biochemical approach should be most interesting. Another problem of the ear is otosclerosis. This leads to the study of bone metabolism. Again, cooperation with other laboratories is indicated.

The Microcirculatory Laboratory looks forward to the future, and new ideas will always be welcome. Cooperation with all laboratories which have related problems will be continuously encouraged.

John W. Irwin, M.D.,
Director of Microcirculatory Laboratory
Francis L. Weille, M.D.,
Surgeon in Otolaryngology

The Board of Managers of the Massachusetts Eye and Ear Infirmary, at their meeting on September 26, voted to promote:

Dr. Julian F. Chisholm, Jr. from his present position of Assistant in Ophthalmology to Assistant Surgeon in Ophthalmology;
Dr. Richard B. Pippitt from his present position of Assistant in Ophthalmology to Assistant Surgeon in Ophthalmology.

* * *

I have recently returned to the Massachusetts General Hospital after spending three most rewarding and enjoyable years at the National Institutes of Health in Bethesda, Maryland. This stay was an enjoyable one not only because of the very stimulating scientific atmosphere which exists there, but also because it afforded an opportunity for the continued friendship and affiliation with many MGH alumni.

When I arrived in Bethesda in 1953, I was anxious to obtain training along fundamental lines so that I might eventually be able to bring some of the vast biochemical advances of recent years to bear upon clinical problems. I thus ventured into the realm of enzymology and into a study of the role enzymes play in some important biologic reactions. I should emphasize at the outset that such ventures were successful only through the advice and assistance of many superb scientists and investigators. Most notably, I am indebted to Dr. Gordon Tomkins and Dr. Herman Kalckar for their advice, assistance, and constant stimulation.

The studies which were carried out were concerned with the elucidation of three basic problems: 1) the manner whereby the body metabolizes and inactivates adrenal steroids, such as cortisone, into biologically inactive products; 2) the mechanism whereby such inactive steroid derivatives are further converted by the liver to their corresponding glucuronides; and 3) the determination of the metabolic defect in the disease galactosemia (galactose diabetes).

It has been known for some time that hormones, such as cortisone, are very rapidly metabolized by the liver to their corresponding "tetrahydro" derivatives (i.e., tetrahydrocortisone). In this process the liver adds four hydrogen atoms to cortisone, thus rendering it biologically inactive. It was of interest to us to learn exactly how this was achieved. We discovered at the outset that the liver possesses two very distinct enzymes—one converting cortisone to dihydrocortisone by the addition of two hydrogen atoms, and the other converting dihydrocortisone to tetrahydrocortisone by the addition of two more hydrogen atoms. But in what manner were these hydrogens added to the steroid molecule? They did not come directly from the atmosphere; neither did they seem to come from the hydrogen ions in the liver cells or their surrounding medium. Instead, it was found that the hydrogen atoms involved were those which were bound to a group of substances known as pyridine nucleotides. More specifically, the type of compound involved was the reduced form of triphosphopyridine nucleotide, or TPNH. It was observed that when TPNH was added to cortisone in the presence of the enzymes mentioned, the H (or hydrogen of TPNH) was transferred to the steroid molecule. In this manner cortisone was converted first to dihydrocortisone and then to tetrahydrocortisone. This proved indeed to be a very exciting and interesting mechanism.

We then proceeded to investigate how the liver further conjugates tetrahydrocortisone to its corresponding glucuronide (tetrahydrocortisone-glucuronide). It had been observed by others that, curiously enough, free glucuronic acid was not involved in this process. In a mechanism somewhat analogous to that described above, it was found that the reaction required a specific cofactor in which glucuronic acid was attached to a nucleotide. The cofactor in this case consisted of a molecule of uridine diphosphate (UDP) linked to a molecule of glucuronic acid to form the compound UDP-glucuronic acid. In the over-all reaction, the glucuronic acid was transferred to the steroid molecule, thus forming tetrahydrocortisone-glucuronide and leaving UDP. Again it was demonstrated that the liver possesses a specific enzyme to carry out this reaction.

We finally turned our attention to the disease galactosemia. This is a condition which occurs in infancy and childhood and in which milk cannot be tolerated. In fact, mental deficiency, cataracts, liver disease, and even death can result unless milk is removed from the diet. The symptoms occur because these patients cannot utilize the sugar in milk (galactose) and convert it—like the normal individual—into glucose and then energy. Such a disease would on the surface have no obvious relation to any of the above problems we were studying. However, the uridine nucleotides are also at work in helping the body convert galactose to glucose. Together with Drs. Herman Kalckar and Elizabeth Anderson, it was found in the investigation of this disease that these patients lack from birth a specific enzyme necessary for the normal metabolism of galactose. This enzymatic defect causes a galactose metabolite to accumulate in the body which is somehow involved in causing the numerous manifestations seen clinically.

As a result of these studies we have been able to devise a rather simple and yet specific blood test for the disease. This allows one to detect galactosemia without resorting to the potentially hazardous galactose-tolerance test which has previously been necessary in order to establish the diagnosis with certainty. We have, in fact, been able to diagnose the disease as early as in the delivery room by means of cord blood. As a result, patients with galactosemia can be placed on milk-free diets from birth in order to prevent the development of symptoms, especially the mental retardation.

Having arrived back at the M.G.H., the plan is to extend the investigations on the metabolism of galactose and glucuronic acid in normal and diseased states. In this direction, the Hospital and Dr. Bauer, as Chief of the Medical Services, have been most helpful in providing a laboratory and support, both moral and financial, to permit these problems to be pursued.

Kurt J. Isselbacher, M.D.,
Assistant in Medicine

The Massachusetts General Hospital Red Cross First Aid Course, which began on October 2 with an enrollment of 31, grew to include 38 members. Mr. Clinton L. Pendleton, Safety Engineer, Safety Department, New England Power Company, one of the ablest first aid instructors in this area, conducted the 18-hour course from 6 P.M. to 8 P.M., Tuesday and Thursday evenings during the month of October.

Graduation exercises and a demonstration of the skills that were acquired in the course will be held on Thursday, November 1, at 6 P.M. Mr. E. Forest Hallet, Director of First Aid and Accident Prevention, Boston Metropolitan Chapter, American Red Cross, will award certificates to the graduates.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

General Medicine

Novey, H. S., Irwin, J. W., Welts, J., and Burrage, W. S.
Removal of ragweed pollen from environmental atmosphere of patients: The evaluation of an electrostatic precipitator combined with an air conditioner.
J. Allergy 27:398-408.

General Surgery

Waddell, W. R., and Kunz, L. J.
Association of salmonella enteritis with operations on the stomach.
New England J. Med. 255:555-559.

Gynecology

Simmons, F. A.
Recent advances in infertility.
M. Ann. District of Columbia 25:415-418, 472.

Physical Medicine

Watkins, A. L.
Medical rehabilitation in a general hospital.
Rhode Island M. J. 39:440-442, 456, 458, 459, 470.

Surgery—Reconstructive

Murray, J. E., and Cannon, B.
Skin grafts for chronic wounds of the lower extremity.
J.A.M.A. 161:1462-1465.

* * *

More than 12,000 hospital leaders from the United States and Canada gathered in Chicago, September 17 through 20, for the 58th Annual Convention of the American Hospital Association.

The theme of the 1956 meeting was "Planning for the future". Among the features of the Convention, whose sessions were held at the International Amphitheatre, were the hospital merchandise mart containing about 500 exhibits, and the 50 round tables on various phases of a hospital's operation.

The 9th Annual Conference of Hospital Auxiliaries was held in conjunction with the American Hospital Association Convention and drew approximately 1,000 representatives of the more than 1,000,000 volunteers working in hospitals. Other groups holding meetings during the Convention were the American College of Hospital Administrators, the American Association of Hospital Consultants, the American Association for Hospital Planning, and the American Association of Nurse Anesthetists.

The American Hospital Association House of Delegates, a 101-member policy-making body of the Association, convened on Monday morning. Ray E. Brown, President of the Association and Superintendent of the University of Chicago Clinics, presided.

Citations of accomplishment, on the 10th anniversary of the Hill-Burton Hospital Survey and Construction Program, were awarded to the authors of this legislation, Senator Lister Hill of Alabama and Associate Justice Harold H. Burton of the United States Supreme Court, and others.

Honorary memberships in the Association were conferred on Dr. Theodore G. Klumpp, Chairman of the Hoover Commission's Task Force on Medical Services; Dr. George F. Lull, Secretary and General Manager of the American Medical Association; and Dr. Emroy W. Morris, President and General Director of the W. K. Kellogg Foundation.

The Association's Distinguished Service Award was presented to Dr. Charles F. Wilinsky of Boston.

Among the speakers at the various sessions were Marion B. Folsom, Secretary of the Department of Health, Education, and Welfare; Dr. Theodore G. Klumpp; Dr. Jack R. Ewalt, Director of the Joint Commission on Mental Illness and Health and Commissioner of the Massachusetts Department of Mental Health; Dr. Lowell T. Coggeshall, Special Assistant for Health and Medical Affairs to the Secretary of Health, Education, and Welfare; George Bugbee, President of the Health Information Foundation; Harrison M. Sayre, President of the Columbus (Ohio) Hospital Federation; J. Stewart Baker, President of the Chase Manhattan Bank of New York City; Nathan J. Stark, Board Member of the Kansas City Area Hospital Association and Vice-President of the Rival Manufacturing Company; Dr. Alan E. Treloar, Director of Research, American Hospital Association; Dr. Howard A. Rusk, Chairman of the Department of Physical Medicine and Rehabilitation, New York University-Bellevue Medical Center; Dr. Joseph N. Schaeffer, Associate Medical Director of the Institute of Physical Medicine Rehabilitation, Peoria, Illinois; Dr. Leonard O. Bradley, Administrator of the Winnipeg General Hospital; Dr. Daniel Blain, Medical Director of the American Psychiatric Association; Samuel Cardinal Stritch, Archbishop of Chicago; Major General Silas B. Hays, Surgeon General, Department of the Army; Dr. Dwight H. Murray, President of the American Medical Association; William S. McNary, Executive Director, Michigan Hospital Service; Dr. Norman A. Welch, Chairman of the Blue Shield Commission; Dr. James A. Shannon, Director of the National Institutes of Health; and Dr. Albert W. Snoke, Director of the Grace-New Haven Community Hospital, New Haven, Connecticut.

Dr. Snoke was installed as President of the American Hospital Association.

Massachusetts General Hospital, of course, was well represented at the Convention. Dr. Dean A. Clark spoke on "Planning for the field tests" at the Session on "Planning for disaster". Mrs. Oliver Cope, Chairman of our Coordinating Committee, under the topic "Foreign aid", described the activities of the Reception Center for Professional Visitors run by the Massachusetts General Hospital Staff Wives Association. This was a part of the "Project parade" at the Hospital Auxiliaries Conference. Miss Ruth Sleeper, R.N., Director of our School of Nursing and Nursing Service, was one of the speakers at the General Session on "Hospital professional relations". Mrs. Soma Weiss, Consultant for Community Relations, conducted an Auxiliary Round Table Session on "Auxiliary-community relations". Others from the Hospital who attended the Convention were Mrs. Floyd H. Blackman, Joseph W. Degen, Frederick D. Foster, Edward Hallinan, Joseph Hill, Daniel A. Pettengill, and E. Michael White.

♣ ♣ ♣

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

Concerts in the Chapel were resumed on Wednesday, October 24, at 3 P.M., after a year's silence unavoidably caused by construction of the new corridor outside the Chapel.

The Staff Wives Music Committee was happy to open its fifth season with one of its own members, Anne Talbot, mezzo-soprano, performing, accompanied by John Woodworth, pianist. Mrs. Talbot has been one of our most well-received performers. Not only the patients, but Hospital personnel and visiting audiences have appreciated her talent.

The second concert will be on November 7, at which time Homer Whitford, organist at the McLean Hospital, will again play for us.

All are most cordially invited to attend these free concerts.

Volunteers are needed to convey the patients from their rooms for these half-hour periods of music. Those interested in assisting should telephone Mrs. Daniel J. Holland, Jr. at Bigelow 4-3020.

The concerts have been planned for every other Wednesday, and will generally be held in the Chapel. However, it is hoped that we may take the music to the various floors where patients are restricted to their beds, and also to the children's floors. Such a concert will then replace the regular Chapel concert planned for that week.

Watch for notices outside the Chapel, at the Front Desk, the Reception Center, in the dining rooms, and also in this column.

♣ ♣ ♣

Brief bits:—

Dr. Edwin L. Cantlon (*E.S.* 1935) has been elected President of the Nevada State Medical Association.

Dr. Oliver Cope will speak to the St. Paul Surgical Society in St. Paul, Minnesota, on November 21. The subject of his address will be "Cushing's disease".

Dr. Wyland F. Leadbetter addressed the American College of Surgeons at their symposium on October 10 in San Francisco. His topic was "New methods of urinary diversion". From October 21 to 27 Dr. Leadbetter was Visiting Professor of Urology at the Indiana University Medical Center.

At the last meeting of the American Goiter Society, which was held in May of this year, Dr. Jacob Lerman, Associate Physician and a senior member of our Thyroid Laboratory, was elected First Vice-President for 1956-57. The President is Dr. Brown M. Dobyns, a former member of the MGH staff.

Dr. Vernon P. Williams spoke before the Ohio Academy of General Practice on "Psychotherapy in General Practice" on September 20 in Columbus, Ohio, at the Academy's Scientific Assembly.

New addresses:—

Dr. Charles R. Campbell (r.p. *Path.* 1955), Peninsula Hospital, Burlingame, Calif.; Mills Memorial Hospital, San Mateo, Calif.
Dr. Herbert S. Cline (a.r.p. *Psychiat.* 1956), 416 Marlborough St., Boston, Mass.
Dr. Robert C. Coe (*S.* 1951), 1115 Columbia St., Seattle 4, Wash.
Dr. Horace B. Frost (*E.S.* 1897), Lavonia Hotel, Lavonia, Ga.
Dr. Dorothy H. Henneman (res. fel. *An.* 1956), Anesthesia Laboratory, Peter Bent Brigham Hospital, 721 Huntington Ave., Boston, Mass.
Dr. Irving H. Itkin (clin. a. *M.*), 36 Pleasant St., Worcester, Mass.
Dr. Joan Kazanjian (r.p. *C.M.* 1956), 3200 Shorewood Drive, Mercer Island, Wash.
Victor V. Koningsberger, Ph.D. (res. fel. *Biochem.* 1956), Van't Hoff Laboratory, Sterrenbosch 1 G, Utrecht, Netherlands
Dr. Monroe A. McIver (*E.S.* 1922), Shiraz Medical Center, Nemazee Hospital, Shiraz, Iran
Dr. Donald B. Martin (*M.* 1955), c/o Dr. George Thorn, Peter Bent Brigham Hospital, 721 Huntington Ave., Boston, Mass.
Dr. Walter T. St.Goar (*M.* 1950), c/o Dr. Myles P. Baker, 262 Beacon St., Boston, Mass.
Dr. Jack E. Tetirick (*S.* 1952), 2922 Ruhl Ave., Columbus 9, Ohio
Dr. Frederick H. Verhoeff (cons. c. *Oph.*), 403 Commonwealth Ave., Boston 15, Mass.
Dr. Earl J. Waddington (a. dn. s.), 6 Haverhill St., Shawsheen Village, Andover, Mass
Dr. C. Gene Wheeler (*S.* 1956), Walker River Hospital, Shurz, Nev.
Dr. Ralph C. Williams, Jr. (*M.* 1955), New York Hospital, 525 E. 68th St., New York, N.Y.
Dr. William E. Wood (*Dn.* 1940), 1832 Connecticut Ave., N.W., Washington 9, D.C.

BIOGLETS

Dr. Reynout Donner, Assistant Resident in Pathology—born in Rotterdam, Netherlands, April 1, 1920; Arts degree (M.D.), University of Leiden, Netherlands, 1946; Assistant in Pathology, University of Utrecht, Netherlands, 1947; Red Cross service in Indonesia, 1948; Resident in Surgery, General Hospital, The Hague, 1949-54; Doctor of Medicine, 1954; Master of Surgery, 1954; Research Fellow, Postgraduate Medical School, University of London, 1955.

Dr. Robert P. Fornshell, Assistant Resident in Orthopedic Surgery — born in Cleveland, Ohio, July 3, 1925; Western Reserve Academy, Hudson, Ohio, 1943; Staff Sergeant, 94th Infantry Division, Third Army, ETO, 1943-46, A.B., Harvard College, 1948; M.D., Harvard Medical School, 1952; Intern and Junior Assistant Resident in General Surgery, Peter Bent Brigham Hospital, 1952-55; Assistant Resident in Orthopedic Surgery, Children's Medical Center, Boston, Massachusetts, 1955-56; married; home: formerly Kent, Ohio, now Brookline, Massachusetts.

Dr. John W. Grover, Intern in Surgery—born in Moorefield, West Virginia, June 21, 1927; U.S. Navy: Electronics Technician, Washington, D.C., 1945-49; A.B. in Biochemistry, Harvard College, 1952; M.D., Harvard Medical School, 1956; married.

Dr. Dale G. Johnson, Intern in Surgery—born in Salt Lake City, Utah, September 27, 1930; B.S., University of Utah, Salt Lake City, 1953; M.D., University of Utah, 1956; married; two children.

Dr. Theodore van Ravenswaay, Assistant Resident in Pathology—born in Boonville, Missouri, July 29, 1927; 2nd Lieutenant, U. S. Infantry, 1945-47; A.B., University of Missouri, 1949; M.D., Washington University School of Medicine, St. Louis, Missouri, 1953; Intern in Medicine, Barnes Hospital, St. Louis, 1953-54; Assistant Resident in Pathology, University of California, 1954-55; Fellow in Infectious Disease, Washington University School of Medicine, 1955-56; married; two children.

Since I share with Holly Smith the dubious honor of being farthest along the sunset slope in years of service on the house staff, I, too, have been asked by the vigorous editor of The News for some memoirs.

All of us house men can reflect on a pretty rich collection of Hospital lore before we have spent many years here, and there have been a great many changes since I came from Chicago in 1948 and first walked awestruck up Grove Street to the foot of the sparkling White Building.

The surgical interns' quarters at that time were in the most dismal and distant corner of dear old No. 9 Parkman Street — a swaying tinderbox where we were no doubt placed because of the surgeon's supposed ability to move quickly in an emergency. That old building was said to have crumbled easily with a slight push by one small workman when Fruit Street was closed off and the Bartlett dormitory built. Many more changes, including the erection of the new Research Building with all the activity which it reflects, have occurred since then. Soon the office building and out-patient development will follow. Such evidences of the strength and adaptability of our Hospital are a clear source of pride to all of us.

But only last year when I had an opportunity to travel abroad and to work in an English laboratory did I come to fully realize the international character of this institution's influence. I was originally attracted to the idea of breaking off my clinical training for a year of research by reading the published accounts of the work of Professor P. B. Medawar of University College, London, in the field of transplantation immunity. It was he, with his colleague R. E. Billingham, who had beautifully demonstrated the ablation of the "homograft reaction" between unrelated animals of the same species by injecting the prospective recipient animal while still *in utero* with a cell suspension derived from the donor strain. This permanent "acquired tolerance" has been the background for much more work in what has become a tremendously expanding field.

As my wife and I flew from Boston on a cold day in September 1951 I was eagerly looking forward to an opportunity for some firsthand experience with British experimental biology. But there was certainly much more than this to being abroad, for we were immediately thrilled

No. 61 in a series of Staff photographs

Dr. John W. Irwin, Assistant in Medicine, M.G.H.—Director of the Microcirculatory Laboratory

with all the rich sights of old London. We were fortunately able to find, with only a moderate amount of footwork, a small flat along the Thames near Kew Gardens. Our first child insistently chose that moment to arrive ahead of schedule, but all went well on the midwifery service at the Middlesex Hospital, and as parents of one of Her Majesty's subjects we felt more at home.

By now it was time to report to my new chief, whom I found with some difficulty in a converted warehouse out behind the magnificent central building of University College. I thought that surely such a makeshift must have been due to bomb damage which had left so many scars in that part of the city. In his charming manner the professor told me, however, that Starling and Bayliss had worked in the same building. We all know of the reputation in America of English and Continental scientists working with few of our accustomed chromium-plated adjuncts. The distinction is an important one, though, because it seemed to pervade the entire thinking of the group with which I was fortunate enough to be associated. Everything they planned had an elegant simplicity which seemed to be appropriate for their unostentatious surroundings and, of course, with the full tradition of British biology.

Some of the marks of the past round the College were quite curious, however. For example, its founder, Jeremy Bentham, who died in 1832, still sits in a glass-faced cabinet in the front lobby of the main building for all to see. This phenomenon, made a little more lifelike by virtue of a skillfully modeled wax head made by the original Madame Tussaud, was provided for in detail by the will of the old "utilitarian", who felt that his guiding influence was too good a thing to end.

Coming directly from the urgent clinical world, it was strange to find myself part of a Department of Zoology where the top subjects of conversation might be parthenogenetic fish or Devonian fossils. The small group working on transplantation immunity was absorbed in its experiments but was right up to date on a wide variety of advances in the international world of ideas, from the sexing of patients by studying the blood smear to the inside story of the Dead Sea scrolls.

I was put to work on several projects, including some experiments with adrenal homografts between pure strain mice, an effort to learn more about the mechanism of Addisonian pigmentation, and finally a project on wound healing. In spite of this activity, I would get out my map of the London tube and bus routes whenever possible and make pilgrimages to the various ancient centers of medical learning round the city. Each one invariably had its boosters of the M. G. H., as I was constantly finding more and more Englishmen who had visited or worked here or had some special interest in us. One particularly fine fellow — John Anderson, a medical man from Durham — is now here working with Dr. Alex Leaf. In addition, there were quite a few other MGH-ers over there on missions similar to mine. George Richardson, Howard and Jane Rasmussen, John Burke, B. W. Cobbs, Ed Ferguson, Walter and Anne St.Goar, Billy Peete, and Dick Currie's sister Ruth were all there at one time or another. They all seemed to be having profitable and enjoyable experiences.

Most of us managed a vacation trip either through the British Isles or to the Continent of Europe. We took our Continental junket in the month of May and found it an ideal time, particularly in southern France and northern Italy.

Altogether the year sped by very quickly. I found that such a multitude of new experiences provided sound food for reflection and a handsome complement to my clinical background here at the Massachusetts General Hospital.

Paul S. Russell, M.D.,
Resident in Surgery

This short but welcome note has come from Dr. Chiu-chen Wang (r.p. *R.* 1952):

> I am now serving with Uncle Sam. I would appreciate it if you would send my News to me at U.S. Army Hospital, Fort Chaffee, Arkansas. I look forward to reading each issue with great pleasure.
>
> I am now the chief of the radiology service at this installation. The equipment is quite adequate and the work load is sufficient to keep me occupied.
>
> My best regards to all my friends and associates at the M.G.H.

[Dr. Wang, in a recent letter to Dr. Clark, says he has received his permanent Massachusetts medical license.—*Editor*]

THE NEWS

1811

No. 162 Boston, Mass. December 1956

UROLOGY SERVICE

Since the establishment of the Urology Service at the Massachusetts General Hospital in 1911, great changes have occurred affecting this special field of diagnosis and therapy. Emphasis in the early days was on the treatment of venereal diseases and their urological complications. The Out-Patient Department was filled with patients treated by urethral irrigations and instillations given for urethritis. Prostatitis, prostatic abscess, epididymitis, and urethral stricture were common sequelae. A urologist was a man who used a cystoscope. Urological surgery was considered unattractive and was, in fact, done in a rather rough and ready fashion by men, perhaps in many instances, inadequately trained to perform a few rather stereotyped procedures. Convalescence from prostatic, bladder, and kidney surgery was protracted and attended by a high morbidity. Consequently, many patients preferred catheter existence rather than the risk of the hazards of surgery.

All this has changed. The advent of specific antibiotic therapy has all but eliminated venereal disease from the Out-Patient Department. Irrigation equipment has all but disappeared from the Out-Patient Department, which now functions as a clinic in which the diagnosis of urological conditions is carried out and which, in effect, acts as a point from which cases are admitted to the ward for surgery and to which patients are discharged from postoperative care. The diagnosis and treatment of female urological conditions, particularly urethritis and cystitis, have become an important part of urological work. At the same time, although actual cure of urinary tract infection may not be regularly possible, control of infection has largely eliminated deaths from pyelonephritis following prostatic, bladder, and kidney surgery. This, together with earlier surgery, better preparation, and proper blood replacement has reduced morbidity and hospital stay of the urological patient to that of the average general surgical patient. Death from these operations is now a rare occurrence.

Although the cystoscope remains the main diagnostic tool, diagnostic methods have been and are continuing to be developed and refined to a point where exploration for diagnostic purposes is rarely necessary. Aortography, nephrotomography, and retroperitoneal air insufflation have provided means for study of the renal circulation and the differential diagnosis of various retroperitoneal tumors and associated lesions.

Urological surgery is now a broad field. The correction of congenital lesions — hypospadias, epispadias, exstrophy, vesical neck obstruction, neurogenic dysfunction, and ureteral and pelvic renal abnormalities — is one of the most interesting phases of urological surgery and encompasses a wide variety of operative procedures. Surgery of prostatic obstruction involving benign and malignant lesions includes special operative techniques which, because of the increasing numbers of older individuals in our population, becomes of great importance. Instead of the usual two-stage suprapubic prostatectomy of the old days, the urologic surgeon is now called upon to do conservative and radical perineal procedures, transurethral prostatectomy which was introduced in 1928, and conservative and radical retropubic prostatectomies. Suprapubic prostatectomy is now done in one stage, often with primary closure of the bladder. Rarely seen on the wards are the large numbers of patients with draining abdominal wounds which were so unsavory. Transurethral surgery has led to the development of difficult and exacting techniques with therapy of prostatic and bladder lesions which require much special training and skill. The radical surgery of bladder neoplasms calls for fortitude in performance of radical cystectomy and urinary diversion operations, which require extensive experience in large and small bowel surgery. Surgery of renal and testicular cancers involves experience in thoracic surgery. Corrective surgery for renal calculi and obstructive lesions involving the renal pelvis calls for fine technical conservative surgery. Experience with vascular lesions and the possibility of renal transplantation which is already an established practice between identical twins is involving the urologist in vascular surgical techniques. Much work is being done to rehabilitate patients with neurogenic bladder dysfunction, which bids fair to allow us to replace all or part of the bladder with segments of the small bowel. Ureters have been replaced with segments of ileum quite satisfactorily, which obviates cutaneous ureterostomy and nephrostomy in many patients. Incontinence of urine in the female is amenable to proper surgical therapy, and efforts are being made to solve this distressing problem in the male.

It has been thrilling for those of us who have engaged in urological work over the past 25 years to watch the developments in urologic surgery and to see how much can now be done for patients afflicted with urinary tract disease. It is likely that we have by no means exhausted the possibilities, particularly along preventive lines, in regard to cancer and urinary tract calculi. In spite of the relative effectiveness of antibiotics, we are a long way from being generally able to cure urinary tract infections.

The Urology Service at the Massachusetts General Hospital is trying to keep abreast of developments and, in a small way, make contributions to progress in this field. Perhaps its greatest contribution, aside from the immediate care of patients, is the training of our resident staff. As indicated above, developments in urologic surgery necessitate a rather long period of training in order to develop individuals who are not only familiar with the diagnostic and the therapeutic aspects of urological work, but who will be able to contribute to the progress in this field through experimental or clinical investigative work. The American Board of Urology now requires 3 years of clinical training in urology which must be based on a sound preliminary surgical experience. Our plan is to take men with 2 or 3 years of general surgical training for a 3-year period. A junior assistant resident rotates between the Baker, Phillips House, and White 10, learning the fundamentals of diagnosis and the care of patients on the wards, and being introduced to urological operative work. Experience in the Out-Patient Department is very valuable. Out-Patient service is stressed because here the resident has a chance to see the results of previous therapy and to acquaint himself with the principles of office diagnosis. Here he performs a very useful function, in that most of the work on the ward, of course, comes from the Out-Patient Department, and the work of the residents in the Out-Patient, therefore, becomes very fundamental to the service. I think we can say that our work in the Out-Patient Department is reasonably satisfactory at present. During his second and third years, graduated responsibility is assumed by the resident until, during his last year, he has control of the ward service on White 10 under the guidance of visiting men and the Chief. The variety of diagnostic and operative work has been quite satisfactory, particularly if we include the very important teaching material derived from private patients seen in the Baker and Phillips House. During 1955 there was a total of 1,373 urological patients admitted to the Massachusetts General Hospital. Five hundred thirty-seven came to White 10. There were 437 operative procedures done on these ward patients and 491 on private patients — a total of 928. Thirteen hundred twenty cystoscopic procedures were done — 723 on ward patients and 597 on private patients. Thus it can be seen that a large volume of diagnostic and operative work is being done in the Hospital. The house staff, even with the help of residents rotating through from surgery, are barely able to keep pace with the load.

Urological Grand Rounds are held the first and third Fridays of each month in the Bigelow Amphitheatre on White 3-A. All residents and students are invited, and visiting physicians are always welcome. In addition, ward rounds on White 10 are held at 4 P.M. on Tuesday and Friday of each week by the Chief of Service. Pathological material is reviewed twice monthly, and a Journal Club is held once each month. Our Tumor Clinic on White 2 each Wednesday morning allows the visiting and resident staffs to follow cancer patients cared for on the ward. Our Out-Patient schedule has been changed to afternoons, to allow better resident and visiting coverage. This is extremely important, since Harvard students attend regularly.

Lastly, an effort is being made to encourage investigative work, which is a significant aspect of a training program and of particular importance to the individual who may wish to engage in academic work after completing his residency. This is now difficult in view of the demands on the residents' time imposed by clinical work and may necessitate still further lengthening of the period of training in individual cases.

We have been fortunate in having visitors from many foreign countries, several of whom are well known. Usually, these men have made rounds with the residents and have brought them new ideas from many sources.

Wyland F. Leadbetter, M.D.,
Chief of Urology Service

* * *

Dr. Arthur W. Allen (*W.S.* 1915), formerly the Chief of the East Surgical Service and currently on our Board of Consultation and a member of our Board of Trustees, was awarded the Henry Jacob Bigelow Medal of the Boston Surgical Society at a meeting held on November 5. This high honor has previously been given to only thirteen recipients in some thirty-one years of its existence. It is worthy of note that the idea of the medal was conceived by Dr. William Sturgis Bigelow in honor of his father, who was not only one of the leading surgeons of his time (1818-1890) but also did much for surgery in this Hospital. In his honor the Bigelow Amphitheatre was built, where Dr. Bigelow's bust, conspicuous for its magnificent beard, dominates the room from a high round niche.

Essentially international in the manner of its bestowal, the medal has been given to four other surgeons associated at one time or another with this Hospital, including Dr. Edward D. Churchill (*W.S.* 1922), our Chief of Surgical Services. It is quite fitting, in this regard, that Dr. Allen should be a recipient of the medal. The effect of many of his studies in the fields of gastrointestinal and vascular surgery has been felt around the world. His influence upon American surgery and medicine through the medium of the American College of Surgeons, the Massachusetts Medical Society, and other associations of which he has been president, has been very important. But perhaps, as Dr. E. Everett O'Neil, the President of the Boston Surgical Society, pointed out, Dr. Allen's greatest contributions have been in the field of teaching and leadership within the walls of the M.G.H., to the many students, residents, and young doctors who have been fortunate enough to have worked with him.

After receiving the medal, Dr. Allen addressed the Society on the subject of "The development of surgery for lesions of the stomach and duodenum". Despite the difficulties of presenting this address to a mixed audience of over 300 people, Dr. Allen delighted his hearers by an extraordinary number of facts and stories about surgical leaders of many generations, presented in a witty and highly entertaining manner. Many persons from the Massachusetts General were able to attend the dinner, enjoy Dr. Allen's speech, and see him receive this high award, which he can add to the many he has received in the past.

Lamar Soutter, M.D.,
Clinical Associate in Surgery
Secretary, Boston Surgical Society

* * *

Dr. Joseph C. Aub was elected President of the Massachusetts Division of the American Cancer Society at the annual meeting of its directors, held in Boston on October 24.

Earlier in the year, Dr. Aub received the Bertner Foundation Award for outstanding contribution in the field of cancer research.

* * *

Francis O. Schmitt, Ph.D., Professor of Biology at Massachusetts Institute of Technology and a member of our Board of Trustees, has been named as one of two winners of the 1956 Albert Lasker Awards for "pioneering studies of the biochemical components of connective tissues, contributing to new understanding of arthritis and rheumatic diseases".

* * *

About 125 guests were invited to attend the unveiling of Dr. Stanley Cobb's portrait on Wednesday afternoon, October 31. Charles Hopkinson, who did the portrait, spoke of the pleasure he had derived from working with Dr. Cobb as a subject. Mr. Phillips Ketchum, President of our Corporation, acted for the Trustees in accepting the portrait, which is to be hung in the Herman Room on the third floor of the Bulfinch Building.

A tea and coffee social hour followed the unveiling ceremony.

* * *

Mr. Joseph T. Prekup, Assistant Director of McLean Hospital, has received the honor of being elected to membership in the American College of Hospital Administrators.

In 1947, prior to his career in hospital administration, Mr. Prekup entered the field of nursing and, after completing a three-year course, received his R.N. He continued in nursing as a charge nurse and in a supervisory capacity until 1950, when he was chosen to study hospital administration under Dr. W. Franklin Wood, then Director of McLean Hospital. At the same time, he studied at Boston University. Soon after receiving his Bachelor of Science degree in nursing, he was appointed Assistant Director at McLean by the Trustees of Massachusetts General Hospital.

Among other affiliations, Mr. Prekup is a member of the Massachusetts Hospital Association.

The Board of Trustees, at their meetings on October 5 and 19, and November 2, voted:

That leave of absence of Dr. Edwin O. Wheeler be terminated and that he be reinstated as Assistant Physician, effective September 1.

To reappoint:

Dr. Shen K. Wang as Assistant Resident on the Orthopedic Service, for the period January 1, 1957 through June 30, 1957.

To appoint:

Dr. Scott Adler as Assistant Resident in Orthopedic Surgery for one year, beginning September 11, 1957;
Dr. Gerald Caplan as Associate Psychiatrist;
Dr. Lincoln D. Clark as Assistant Psychiatrist, beginning March 1, 1957;
Dr. James H. Duxbury as Assistant Resident in Urology for one year, beginning July 1, 1957;
Dr. Thomas C. Hall as Assistant in Medicine;
Dr. William H. Harris as Assistant Resident in Orthopedic Surgery for one year, beginning February 4, 1957;
Dr. John R. Huckell as Assistant Resident on the Orthopedic Service for one year, beginning July 1, 1957;
Dr. William F. Murphy as Attending Psychiatrist at McLean Hospital;
Dr. Austin F. O'Malley as Assistant Resident in Urology, for the period January 1, 1957 through June 30, 1957;
Dr. Anne Parsons as Assistant Sociologist at McLean Hospital;
Dr. Narendra M. Purandare as Visiting Pathologist pro tempore, for the six-month period beginning September 24;
Dr. John B. Tallon as Assistant Resident in Orthopedic Surgery for one year, beginning April 18, 1957.

At their meetings on October 10, 17, and 24, the General Executive Committee voted:

To rescind the appointment of Dr. Ernest E. Musgrave as Clinical Fellow in Medicine, effective as of August 20.

To extend the appointments of:

Dr. Tucker A. Barth as Assistant Resident in Orthopedic Surgery, from January 1, 1957 through March 31, 1957;
Dr. William R. Shanahan as Clinical Fellow in Medicine to December 12;
Dr. Charles V. Treat as Clinical Fellow in Medicine to July 15, 1957.

To reappoint:

Mary D. Albert, Ph.D. as Research Fellow in Medicine for one year, beginning November 1.

To appoint:

Dr. Manik S. Kanvinde as Graduate Student Assistant in Pathology for one year, beginning September 24;
Dr. Marie-Louise Levy as Clinical Fellow in Anesthesia, beginning October 29;
Dr. Marc P. Moldawer as Clinical Assistant in Medicine, beginning October 15;
Allan U. Munck, Ph.D. as Research Fellow in Medicine for one year, beginning July 1.

The General Executive Committee also voted to appoint the following as Graduate Student Assistants in Medicine, assigned to Cardiology, for one year, beginning October 1:

Dr. Tsung O. Cheng	Shanghai, China
Dr. Roderick W. Childers	Dublin, Ireland
Dr. Alvaro Currea	Bogotá, Colombia
Dr. Louis R. Dinon	Drexel Hill, Pa.
Dr. Lee Ehrlich	Phoenix, Ariz.
Dr. Alberto J. Guinand-Baldo	Caracas, Venezuela
Dr. Aldo Jacono	Naples, Italy
Dr. Elbridge E. Johnston	St. Johnsbury, Vt.
Dr. Jayme Maltz	Pôrto Alegre, Brazil
Dr. James T. Moy	Wichita, Kan.
Dr. Kappiareth Nair	Bombay 5, India
Dr. Lawrence B. Reppert	San Antonio, Tex.
Dr. Jesus I. Sarkis	Alajuela, Costa Rica
Dr. Kenneth L. Stuart	Jamaica, West Indies

* * *

Dr. Paul C. M. Zamecnik, Physician on our staff, has been appointed Collis P. Huntington Professor of Oncologic Medicine at Harvard and Director of the J. Collins Warren Laboratories of the Huntington Memorial Hospital here at Massachusetts General Hospital. He succeeds Dr. Joseph C. Aub who retired last summer but who is carrying on his research work in quarters in the new Warren Building. Dr. Zamecnik will also serve as Chairman of the Executive Committee of the Departments of Medicine at Harvard Medical School.

Dr. Zamecnik was born in Cleveland, Ohio. He received his A.B. degree (*magna cum laude*) at Dartmouth College in 1933 and his M.D. at Harvard Medical School in 1936. He is a member of *Phi Beta Kappa.* Immediately after graduation he became a medical resident and research fellow at the Collis P. Huntington Memorial Hospital. He interned in medicine at the University Hospitals in Cleveland. Since then he has been closely associated with Dr. Aub.

During 1939-1940 Dr. Zamecnik was a Moseley Travelling Fellow from Harvard Medical School and Visiting Investigator at the Carlsberg Laboratory in Copenhagen, Denmark. On his return to the United States, he served from 1940 to 1942 as a Finney Howell Research Fellow at the Rockefeller Institute for Medical Research in New York. He rejoined the Huntington Memorial staff in 1942, was appointed Instructor in Medicine at the Harvard Medical School, and, at the same time, was named Assistant in Medicine at the Massachusetts General Hospital. In 1946 Dr. Zamecnik was named as Associate in Medicine at Harvard Medical School and, in 1947, a Tutor in the Biochemical Sciences at Harvard. He became Executive Secretary of the Committee on Research and an Assistant Physician at Massachusetts General in 1948. In 1949 he was appointed Assistant Professor of Medicine at the Massachusetts General Hospital, Harvard Medical School, and in 1952 an Associate Professor of Medicine. From 1951 to 1954 he was also an Associate Physician at the Homberg Memorial Infirmary, Massachusetts Institute of Technology. Our Board of Trustees, on July 20, 1956, voted to promote Dr. Zamecnik to the position of Physician on our staff.

In 1946 and again in 1950, Dr. Zamecnik shared the John Collins Warren Triennial Prize, given every three years at Massachusetts General Hospital. The Prize, founded by the late Dr. J. Mason Warren in memory of his father, is awarded to the author (or authors) of the best dissertations on some subject in Physiology, Surgery, or Pathological Anatomy. In 1946 Dr. Zamecnik shared the award with Dr. Fritz Lipmann, and in 1950 with Dr. Ivan D. Frantz, Jr., a former member of the Hospital staff, and Dr. Mary L. Stephenson, a member of his laboratory staff.

Since 1910 both cancer research and teaching concerned with the clinical care of cancer patients at the Harvard Medical School have been centered in the Huntington Memorial Hospital and the Warren Laboratories. The hospital-laboratory combination was one of the first established in the United States dedicated to cancer research and the care of cancer patients. For more than two decades the Hospital and Laboratories were located at the intersection of Huntington Avenue and Shattuck Street in Boston, adjacent to the Harvard Medical School. This building is now occupied by a portion of the offices and laboratories of the Harvard School of Public Health. Since 1942, when the University decided that the care and treatment of cancer patients and research into the causes of the disease could better be served within a large general hospital, the Huntington Hospital and Warren Laboratories have been a physical part of the Massachusetts General Hospital. Since 1951 the hospital and laboratory services have been located in the new Research Building here.

Beyond his contributions as a medical investigator, Dr. Zamecnik has won high regard as a physician and teacher. He is regarded by his colleagues as "one of those rare persons who combine both these disciplines with great success."

In his investigations of chemical processes in both normal and tumor or cancer cells, Dr. Zamecnik has directed his major attention to the incorporation of amino acids into proteins — the building of proteins by body cells.

Proteins — one of the most important constituents of living matter — are formed by the linkage of amino acids (the so-called building blocks of the body), of which 22 are known to exist. The amino acids are joined in intricate patterns by chemical bonds to form peptide chains and the more complicated protein structures. Proteins form the fibres that provide the contracting elements in muscles; they spread as a shield over the skin surfaces to protect tissues lying beneath; as enzymes, they aid in the digestion of foodstuffs and synthesis of the constituents of new cells; as hormones, they direct the rate of body metabolism; and as antibodies in the blood stream, they protect the body against viral and bacterial diseases.

Suspecting there might be a linkage between the abnormal growth of cells (as in cancer) and the formation of proteins, Dr. Zamecnik and his group, in recent investigations, have observed that the rapid conversion of amino acids to proteins takes place in the microsomes — finely granular elements of protoplasm — and in tumor cells at a much higher rate than in cells of normal tissue from which they originated.

Much of Dr. Zamecnik's successful research has been through the use of radioactive "tagged" amino acids. He was one of the early researchers to use these nuclear tools in the study of normal and abnormal tissue growth. By replacing non-radioactive carbon in the amino acid molecule with Carbon 14, which is radioactive, Dr. Zamecnik and his group have been able to study not only the incorporation (synthesis) of the amino acids into proteins, but the rate of synthesis as well.

His current work is concerned with the chemistry involved in the formation of the linkages — peptide bonds — between the amino acids in the formation of proteins. It is a field in which a fundamental abnormality of cancer may well be involved.

Dr. Zamecnik is a member of the American Academy of Arts and Sciences, the American Association for Cancer Research, the Association of American Physicians, and the American Society of Biological Chemists.

* * *

The following letter was sent to all members of the Staff on October 9:

As you know, we are proud of the fact that the Massachusetts General Hospital has not had to increase room and board or Clinic rates in nearly five years, in spite of the fact that our annual expenses (excluding research) have gone up from $7.5 million to nearly $10 million and our annual free service from $1 million to $1.5 million during that time. We are at the moment charging the lowest board and room rates among the teaching hospitals of Boston. This has been made possible not only through rigid economies but also, in large part, with your greatly appreciated help, by the increase in occupancy over this period and, in addition, in the past year, by the magnificent support given the Hospital by the National Foundation for Infantile Paralysis.

We have now reached the point where no substantial increase in occupancy is either desirable or possible. Meanwhile, we have had substantial increases in salaries and wages and in the price of food, drugs, and general supplies, the full effect of which will not be felt until the current fiscal year which began October first, just past. Consequently, we have no choice now but to increase charges.

The Board of Trustees, at its meeting of October 5, 1956, authorized an average increase of $3 a day in room and board rates in all units of the Hospital, and of 50 cents per Clinic visit, effective October 15, 1956. This will bring our Ward rate for room and board to $19 a day and our Clinic rate to $3 a visit. These rates are comparable to those already being charged by other teaching hospitals in the city. We shall, of course, continue the policy of adjusting these charges downward for individuals in need.

All of us are sorry to have to make these increases, but the Board is confident you will understand the reasons for them and will join in our efforts to keep the occupancy as level as possible and to practice the strictest economy consistent with high standards of service.

Sincerely yours,
Dean A. Clark, M.D.,
General Director

MASSACHUSETTS EYE & EAR INFIRMARY

This year marks the 10th anniversary of the Boston Eye Bank. During these 10 years the services of the Eye Bank have played a vital role in providing eye tissue for the rehabilitation of nearly 200 blinded individuals through corneal transplantation. In addition, many eyes, which could not be used for transplantation, have been distributed for research studies into the causes of other blinding diseases, notably glaucoma and separation of the retina.

To accomplish this goal of providing necessary eyes for these vital purposes, a continuing program of education of the public and of the medical profession in general has been carried out. All modern means of communication have been utilized — such as TV, radio, newspapers, magazines, and posters. Talks before groups, illustrated by a technicolor moving picture with sound, have proved very popular and instructive. The success of the program has been due to the wonderful help, financial and otherwise, of many individuals and groups. Special credit is due to the young women who have so capably filled the position of Executive Secretary, with its many great responsibilities. The Boston Junior League gave unstintingly in time, effort, and finances, in the first years of the Eye Bank, thus assuring much of its success over these 10 years.

The Eye Bank is a nonprofit organization, dependent on voluntary contributions, and finances have been a major source of concern on many occasions. Along with public education and appeals for donation of eyes have gone appeals for financial contributions. The Eye Bank takes justifiable pride in the great good it has helped to accomplish for the blinded, while carrying on its services on a remarkably low budget. However, finances remain a major problem.

At the present time, nearly 70 hospitals throughout New England are affiliated with the Eye Bank, in the program of making eyes available. Without the interest and cooperation of the personnel of these institutions, the Eye Bank could not function. In this connection, special thanks are due the staff of the Massachusetts General Hospital.

Transportation of eye tissue has been accomplished through the voluntary and cooperative efforts of the airlines, railroads, and the Red Cross Motor Corps. This has simplified what could well be a major problem, and these agencies have earned the sincere gratitude of the Eye Bank.

With the ever-widening horizon of transplantation surgery, advances in operative technique and the accumulating knowledge from research, it is evident that the Eye Bank has come to occupy a most important position in the field of visual restoration and rehabilitation.

Aside from the necessary financial support, the future success of the Eye Bank rests on the receipt of eye tissue which, in turn, depends upon an informed public and interested medical profession. A program of continuing information and education is necessary.

Garrett L. Sullivan, M.D.,
General Director of the Boston Eye Bank

On October 15, the Executive Committee of the Massachusetts Eye and Ear Infirmary voted that:

Dr. Endre A. Balazs of the Retina Foundation, formerly a Fellow in Ophthalmology, be given the title of Biochemist in Ophthalmology;

Dr. Edward C. Ferguson be appointed as Fellow in Ophthalmology;

Dr. Kevin Hill be appointed as Fellow in Ophthalmology, retroactive to January 1;

Marie A. Jakus, Ph.D. of the Retina Foundation, formerly a Fellow in Ophthalmology, be given the title of Biologist in Ophthalmology;

Harold Kern, D.Sc. of the Howe Laboratory of Ophthalmology be given the title of Biochemist in Ophthalmology;

Jin Kinoshita, Ph.D. of the Howe Laboratory of Ophthalmology be given the title of Biochemist in Ophthalmology;

Dr. Pei-Fei Lee be appointed as Fellow in Ophthalmology;

Leona Zacharias, Ph.D., formerly a Fellow in Ophthalmology, be given the title of Biologist in Ophthalmology.

Ether Day was observed this year with the customary awarding of Service Pins. The occasion took place in the Moseley Rotunda, with Dr. Clark acting as master of ceremonies and awarding the pins. In his opening remarks Dr. Clark spoke of the "oneness of the Hospital", with every department working for the Hospital as a whole. Mr. Ralph Lowell brought greetings from the Board of Trustees and expressed the appreciation of the Board for the years of faithful service on the part of so many who are associated with the Hospital. Mr. David C. Crockett gave us a word panorama of the genesis of the new Warren Building, from the original introduction of the idea in 1903 to the present 12-story building on Charles Street.

Of the nonprofessional group, 144 received pins for 5 years of continuous service at M.G.H., 49 for 10 years, 8 for 20 years, and 9 for 30 years.

Members of our professional staff who received 25-year pins numbered 9 this year.

Three members of the Ladies' Visiting Committee were given special recognition for 50 years of volunteer service to the Hospital. They are Mrs. Richard W. Hale, Mrs. Arthur D. Hill, and Mrs. Sherman Miles.

Following these ceremonies, refreshments were served and all were invited to go on a tour of the new building.

* * *

The Reverend William B. Spofford, Jr. began his duties as Supervisory Protestant Chaplain at Massachusetts General Hospital on October 15, succeeding the Reverend James H. Burns.

The son of an Episcopal clergyman, Mr. Spofford comes to Massachusetts General from the position as Director of the Western Extension Center of the National Town-Country Church Institute of the Episcopal Church in Weiser, Idaho. Prior to that, he was Chairman of the Department of Sociology at Park College, Parkville, Missouri, and Associate in Research and Community Relations at the Roanridge Training Center in Missouri.

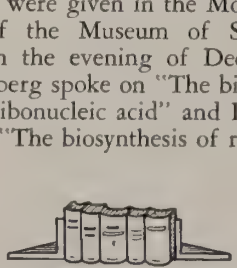
Mr. Spofford is a graduate of Antioch College, the Episcopal Theological School in Cambridge, Massachusetts, the University of Michigan School of Social Work, and the Yale School for Alcohol Studies. He was the first recipient of the General Service Fellowship of the Department of Pastoral Services of the National Council of Churches. He did his clinical training at the Topeka State Hospital and the Kansas Boys' Industrial School in Topeka, Kansas. His first assignment following ordination in 1944 was as Rector of the Church of the Good Shepherd in Boston, and Assistant Social Service Secretary of the Diocese of Massachusetts.

Mr. Spofford's major claim to fame, he states, is that he is the father of five sons, three of whom are triplets. He says his ambition is to sell them as a complete infield to the New York Yankees a few years hence, and then to spend the winter months helping the venerable Casey Stengel continue to produce world champions.

* * *

The Warren Triennial Prize Lectures of the Massachusetts General Hospital for 1956 were shared between Dr. Arthur Kornberg, Professor of Microbiology, Washington University School of Medicine, and Dr. Severo Ochoa, Professor of Biological Chemistry, New York University College of Medicine.

The lectures, which took the form of a symposium on the biosynthesis of nucleic acid, were given in the Morse Auditorium of the Museum of Science in Boston on the evening of December 5. Dr. Kornberg spoke on "The biosynthesis of deoxyribonucleic acid" and Dr. Ochoa spoke on "The biosynthesis of ribonucleic acid".



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Cardiology

Currens, J. H.
Medical treatment of hypertensive vascular disease.
Am. Pract. & Digest Treat. 7:1237-1241.

General Surgery

Cavanagh, C. R., and Parkhurst, E. C.
The management of acute cholecystitis.
Ann. Surg. 144:188-190.

Churchill, E. D.
General education in Surgery. (Editorial)
Ann. Surg. 144:506.

McDermott, W. V., Jr., Wareham, J., and Riddell, A. G.
Bleeding esophageal varices: A study of the cause of the associated "hepatic coma".
Ann. Surg. 144:318-335.

Sweet, R. H.
A consideration of certain benign lesions of the esophagus.
Surgery 40:447-458.

Brief bits: —

Dr. Edward B. Benedict attended the first meeting of the season of the New England Roentgen Ray Society, held in Cambridge on October 19. He discussed a paper by Dr. Bernard S. Wolf entitled "Lesions of the lower esophagus". Dr. Benedict has been appointed a member of the Board of Advisors of the Boys' Clubs of Boston.

On October 19, Dr. Edward D. Churchill gave the 7th Annual Alfred A. Strauss Lecture, at the University of Washington School of Medicine, Seattle, Washington. His subject was "The nature of wounds and wound healing". On returning from Seattle, Dr. Churchill gave a glowing account of the MGH graduates in that area. Among others, he saw Dean Crystal (*W.S.* 1942), Chuck MacMahon (*E.S.* 1938), Frank Milam (*S.* 1949), and, of course, Bob Coe (*S.* 1951), who had just arrived in the Northwest.

On October 28, Dr. Erich Lindemann addressed the Josiah Macy, Jr. Conference on Medical Administration. His topic was "Mental health and medical administration".

On October 18, Dr. Richard H. Sweet addressed the Academy of Medicine of New Jersey, at Newark, New Jersey, on the subject "The diagnosis and treatment of mediastinal tumors".

On October 16, Dr. Arthur L. Watkins gave the Lawrence Barnes Hayward Memorial Lecture, at the University of Vermont College of Medicine, in Burlington, Vermont. His address was titled "Electromyography as a diagnostic tool". Dr. Watkins also addressed the third year medical class at the University on the subject "Physical Medicine and rehabilitation".

Dr. James C. White was appointed a member of the National Institutes of Health Neurology Study Section, by the Surgeon General, last July.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

The recent tea, given by the MGH Staff Wives on October 17 in Bartlett Hall, was most gratifying. The feeling of general good will was something that all the Staff Wives and our visitors from other lands will long remember. Fifty-nine different countries were represented at the tea. It is remarkable that the Hospital has attracted such an international group, and we all benefit from this cosmopolitan association.

Mrs. Daniel S. Ellis was chairman for this occasion, ably assisted by Mrs. Robert R. Linton as her vice-chairman. Working with these two ladies were Mrs. Henry K. Beecher, Mrs. Chester N. Frazier, Mrs. Charles B. Burbank, and Mrs. Claude E. Welch.

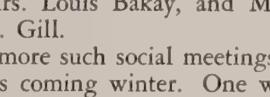
The members of the Ladies' Visiting Committee who poured were Mrs. Floyd H. Blackman, Mrs. Reginald Jenney, and Mrs. Morrill Wiggin. The Staff Wives who poured were Mrs. Howard Ulfelder and Mrs. Leland S. McKittrick.

Special hostesses for the tea were Mrs. Robert S. Shaw, Mrs. Richard C. Austin, Mrs. John P. Bunker, Mrs. John W. Cass, Jr., Mrs. Jackson M. Thomas, Mrs. Bartlett H. Stone, Mrs. C. Miller Fisher, Mrs. Laurence L. Robbins, Mrs. Victor A. Politano, Mrs. Louis Bakay, and Mrs. Benjamin F. Gill.

Two more such social meetings will be held this coming winter. One will be a morning coffee on Tuesday, January 15, and the other a tea on April 10. The Staff Wives hope that all will join us in the effort to make our visitors from other countries feel at home at the Massachusetts General Hospital.

The Morning Chorale, a group of 28 women from Belmont, Brookline, Cambridge, Lexington, and other surrounding towns, directed by Mary Loud of Lincoln, will once again sing a Christmas program in the Chapel, on Wednesday, December 12, at 3 P.M.

Watch for further announcements from the Music Committee, as they plan a series of interesting programs for the coming season. Mrs. John D. Crawford, Chairman of the Music Committee, is doing a very thorough job in making these arrangements.



This interesting letter, beginning "Dear folks", has come from Captain Oscar S. DePriest, III (*S.* 1955). His address is 279th Station Hospital, APO 742, c/o Postmaster, New York, N. Y.

To begin with, after leaving Boston in the middle of June, my family and I motored home

No. 62 in a series of Staff photographs

Dr. Paul C. M. Zamecnik, Physician — newly appointed Director of the J. Collins Warren Laboratories of the Huntington Memorial Hospital at the Massachusetts General Hospital

by way of Washington. We had a much needed rest, but the vacation was all too short and was followed by an almost unbelievable experience at Fort Sam Houston, Texas.

I arrived at San Antonio on July 5, at 8:30 A.M. The temperature was 105 degrees. At this point I was certain I had made a mistake in volunteering for the Army. Nevertheless, after regaining my breath, I managed to find my way out to the Fort and was assigned barracks, field equipment, mess units, etc., all at once. My barracks — and they were indeed barracks — were renovated, but I use the word "renovated" very loosely. They were enlisted men's quarters which apparently had not been opened since World War II. They were located one mile from the quadrangle of the Army Medical Service School, and we grew so fond of them that we called the area Andersonville. There were 40 of us in the barracks, with bathroom facilities for 3. The one good aspect about the place was that there was a swimming pool right outside, and if you did not mind the risk of chloride poisoning (the water was very heavily chlorated) you could have a fairly enjoyable time there.

When I say it was hot in Texas, I mean it was really hot. The pleasantest time of the day was between 6 and 7 A.M. After that, the temperature rose rapidly, reaching great heights round 4 in the afternoon and staying there until 9 or 10 at night. Happily, at the time when the temperature reached its peak, the Officers' Club opened. Since this was one of the few air-conditioned places on the Base it was, needless to say, heavily and constantly patronized. The only other air-conditioned place was the theatre, and under these conditions even "Rock around the clock" looked good. I could give you more about some of the experiences in Texas while training to be a soldier, but. . . . On these matters I could write volumes — for instance, concerning the infiltration in close combat course at Camp Bullis — so you can perhaps imagine how pleased I was to be assigned to Germany. At that time I would have been pleased to have been assigned anywhere outside of Texas. On the day I left San Antonio it was 104 degrees, thus you have some idea of the mean summer temperature.

My next stop was at Fort Dix, New Jersey, and, after spending several miserable humid days there, we left for Germany. By this time I realized that I had been assigned to Berlin and, in view of the stories I had heard, I was not particularly overwhelmed with joy. Sixteen hours later, after a very ragged ride in a Navy Mats plane which lacked quite a few of the basic essentials of comfort, we landed in Frankfurt. From there a train took us through the Iron Curtain and we arrived in Berlin on 30 August at 7:30 A.M.

To say that I am surprised at and pleased with my assignment in Berlin would be a great understatement. This is perhaps one of the most beautiful cities I have ever seen. The people are friendly and courteous, and appear to be very appreciative of all we have tried to do for them. This is in contrast with some of the impressions we have received outside this Command. My job is Assistant Chief of Surgery, and the work here is very interesting. Our major procedures are in the category of thyroidectomies, and otherwise most of our work consists of the ever-present pilonidal sinuses, hernias, appendectomies, ingrown toenails, and a multitude of strains, sprains, and backaches. Nevertheless, I enjoy every minute of it. In addition to this, I am Chief of the Laboratory Service, and I have spent a great deal of time trying to reorganize the blood bank on the basis of the system we have at the M.G.H., thanks to the help of Drs. Rasmussen and Shaw. Our progress in this field is slow but steady.

With regard to the fact that we are the only American unit behind the Iron Curtain, one really does not notice it. We do not bother the others and they do not bother us. The town is so large that you never get the feeling of being restricted. The contrast between East and West Berlin is so great and so unbelievable that any discussion I might attempt would be so hard to believe I will not even make the effort.

I forgot to mention that Walter Klingensmith and Frank Austen also shared my trials and tribulations in Texas. Walter is now in Italy and Frank is at Walter Reed. One of the pleasantest coincidences is the fact that Jan Koch-Weser is now assigned to this hospital with me. Needless to say, this is like a breath from home, and together we are seeing Berlin.

⁂

THE MOSELEY PLATEAUS

While climbing the Matterhorn this past summer, my guide drew my attention to two small plateaus called the "Lower and Upper Moseley Platten". He told me that in 1879, in the vicinity of these two plateaus, Dr. William O. Moseley of Boston had fallen to his death. Dr. Moseley was an Intern on our West Medical Service in 1878. By the attachment of his name to these two plateaus Dr. Moseley's name is perpetuated in Switzerland, as it is in Boston by the Moseley Building of the Massachusetts General Hospital.

Dr. Moseley was one of the first to climb the Matterhorn, which had first been ascended in 1865 by a group of eight mountaineers, four of whom perished during the descent. The two "Moseley Platten" are located a short distance above the upper Matterhorn Hut, a small shelter at a height of 13,100 feet and 1,700 feet below the summit. Each of the two plateaus is reached by a nearly vertical climb in a so-called chimney. The two plateaus jut out slightly from the mountain, so that one looks directly down, thousands of feet, to the Matterhorn glacier. Moseley, according to the records at the Massachusetts General Hospital, on his way from the summit, slipped and fell down 2000 feet. A guide had accompanied him, but he had declined to be tied to the guide by a rope.

Walter F. Lever, M.D.,
Associate Dermatologist

THE NEWS

No. 163 Boston, Mass January 1957

DEDICATION OF THE NEW WARREN BUILDING

Our new 12-story, $4 million Warren Building was dedicated on the afternoon of December 3. Invited guests assembled in the lobby of the building at 2:45 for the dedicatory exercises. Seated on the platform were Right Reverend Robert P. Barry, Dr. Edward D. Churchill, Dr. George Packer Berry, Dr. Dean A. Clark, Dr. Wilder G. Penfield, Mr. Phillips Ketchum, Mr. Ralph Lowell, and Mr. Francis C. Gray, Chairman of our Board of Trustees, who acted as Chairman for the occasion.

Mr. Gray asked Monsignor Barry, a trustee of the Hospital since 1941, to offer the invocation, after which Mr. Gray opened the exercises with the following remarks:

We have asked you here today to thank you, and through you the thousands of other donors who could not come, and also to see this superb building which your interest, generosity, and belief in medical science has made possible. The building as originally planned was for pathology, neurology, psychiatry, and dermatology. Then the neurosurgeons made a strong case to be included and that added another floor. Later still, the trustees became convinced that some additional private and semi-private beds were greatly needed, as well as doctors' offices. So it grew to its present height — but your contributions went only to the five medical science floors. To those floors came gifts from far and near — from corporations and foundations, the United States Public Health Service — and above all from the friends of the Hospital. It may be of interest to note that charitable foundations outside the Commonwealth showed their confidence in the Hospital by contributing over one-third of the sum required.

The building houses not only the marvels of modern scientific equipment, brilliant doctors and scientists, but also your hopes and ours, that from the studies and investigations that take place within its walls, will emerge sources of knowledge to bring lasting benefit to mankind.

So let me, on behalf of the trustees and the staff, express our heartfelt gratitude to you — one and all — and to the warm and generous friends of the M.G.H. wherever they may be.

Following his opening remarks, Mr. Gray said that Mr. Phillips Ketchum, President of the MGH Corporation, and Mr. Ralph Lowell, a member of our Board of Trustees since 1940 and Chairman of the Building Committee, were not going to address the audience, but he asked them both to rise and take a bow.

Mr. Gray then introduced Dr. Churchill with these words:

Chief of the Surgical Services of this Hospital and John Homans Professor of Surgery at the Harvard Medical School, Dr. Churchill was Consulting Surgeon for the Mediterranean Theatre in World War II. His judgment and knowledge are constantly sought by foreign governments as well as our own, and, incidentally, he has just returned from a trip to the Middle East for the Defense Department in Washington. But today we ask him to turn historian and tell us of the contribution, so deeply woven into the fabric of the M.G.H., by generations of the distinguished Warren family for which this building is named.

Dr. Churchill's address:

My contribution to these exercises will be confined to the recording of an incident in the life of J. Collins Warren, a prime mover in the building of the present Harvard Medical School, and a revered member of the surgical staff at this Hospital. In 1867 young Coll Warren, in the course of medical studies abroad, had spent the spring semester in Vienna. He was looking forward to a summer in Switzerland and then to a return to Vienna for more advanced work in surgery and pathology. On July 25th, 1867, the work of the term having been completed, he left Vienna and reached Munich the following day. An event then occurred which threatened to cut short this important phase of his professional education. A not wholly unexpected cable message was relayed to Munich and through prompt action of the German police force reached Coll Warren at his hotel around midnight. The cable asked that he return home immediately because his father's illness had become critical. By four in the morning Coll was aboard the Vienna-Paris express on his homeward journey.

By catching the steamer, *City of London,* sailing out of Liverpool on the 31st, he arrived in Boston in time to see his father, J. Mason Warren, several days before his death. This occurred on August 19th, 1867.

Coll Warren was now twenty-five years of age and in his own words, "At the very outset of my career I was suddenly deprived of aid and counsel such as only a father can afford." An immediate decision had to be made whether to remain at home and at once take up the established practice of his father, or to return to Europe and go ahead with plans to obtain a well-rounded education. The opportunity to step into a going practice was a strong temptation to the young Warren. Young surgeons seeking to perfect themselves are ever pressed by curious friends as to when their seemingly endless preparation will come to an end and they will start the business of life.

Faced with this decision, young Coll sought the advice of Oliver Wendell Holmes, an old neighbor and friend of the family. The Autocrat was not a man to waste words in such circumstances. "A Warren," he said, "does not measure his professional success by patronage, as does a corner grocer."

"This was the keynote which persuaded me," Dr. Warren wrote in his reminiscences many years later. "I decided to return to Europe and complete the plan of education which had been formulated a year previously." Passage was booked on the Cunard steamer *China*. and he left Boston on October 25th.

The associations with Billroth, Langenbeck, Virchow, Cohnheim, and ultimately with Joseph Lister gave lasting form to his professional life. I have told elsewhere of the friendship with Henry P. Bowditch which developed in Paris during the spring of 1869 at the Collège de France. These two men brought scientific medicine to Harvard and through their efforts the present Medical School came into being.

And so the pattern of the life of J. Collins Warren was shaped by the proud standards of the Warren family. A friend of the family wrote in 1854: "On one occasion I saw in the surgical amphitheater three generations of Warrens, John C., J. Mason and J. Collins, the latter a boy of twelve." Holmes once spoke of the wisdom which accrued to a family doctor from being able to "triangulate" a family, meaning to observe it through three generations. Possibly he was thinking of his advice to young Coll.

The standards and values that were so productive in the life endeavor of J. Collins Warren as an individual and in the many works of the Warren family are equally valid for the Hospital. Against the background of our highly materialistic society these standards are likely to be confused or lost altogether. Today in giving the Warren name to this building the Hospital has again expressed a conviction that its own professional distinction cannot be measured by patronage. The Hospital is not a corner grocery. It has again given evidence of its intent to press ahead with educational undertakings and carry its share of the advancement of the healing arts. It is fitting that the name Warren once again be given to a major building of the Hospital. It is especially appropriate that the building which will carry this honored name is not primarily for the extension of practice, but provides space and gives emphasis to medical science and teaching.

Then followed Mr. Gray's introduction of Dr. Berry, with these words:

The Harvard Medical School was started in 1783. Thirty-eight years later the M.G.H. opened its doors and there began an affiliation, the benefits of which to the progress of this Hospital are incalculable. No forward step such as the opening of this building would be complete without the presence of the Dean of the School, and we are happy to have George Berry — a friend held high in our affection and regard — who, in the seven short years he has been the Dean, has brought strength to the School, to its teaching hospitals, and to the advancement of medicine.

[We regret that, since Dean Berry spoke from notes, we are unable to give the full text of his deeply moving address. However, he kindly sent us a copy of this portion of his speech. —— *Editor*]

At Colorado Springs, at the opening session of the 1956 Institute on Evaluation of the Student: The Appraisal of Applicants to Medical Schools, I tried to focus on the essential quality of the good teacher — his capacity to give of himself. For emphasis I chose some lines from *The Prophet* by Kahlil Gibran.

Several participants at the Institute asked me to send them the lines quoted. I take this convenient way of complying, and because I was also asked about Kahlil Gibran, I add a word about this remarkable man.

Kahlil Gibran (1883-1931) — poet, philosopher, artist — was born in Lebanon, a land that has produced many prophets. He came from a family of wealth and culture. Millions of Arabic-speaking peoples familiar with his writings in that language regard him as the genius of our age.

He visited the United States when he was twelve, but returned shortly to pursue his education in Syria. As a young man, he went to Paris to study at the Collège de Beaux Arts. He lived for the last twenty years of his life in New York City.

Gibran's earlier prose poems were written in Arabic, but by the time he was twenty he had adopted English as his medium. Before his untimely death in 1931, his fame and influence had spread far beyond the Near East. His poetry has been translated into more than twenty languages. His drawings and paintings have been exhibited in the great capitals of the world. Auguste Rodin compared his work to that of William Blake.

The Prophet was published in 1923. Since then, the American edition, published by Alfred A. Knopf of New York, has been reprinted more than three score times. This charming edition contains twelve illustrations reproduced from Gibran's mystical drawings. In *The Prophet,* the poet discusses particularly Man's relation to his fellow Man. Many find in his majestic language an expression of the deepest impulses of Man's heart and mind. In a later poem, *The garden of the Prophet,* published in 1933, Gibran deals with Man and Nature.

The lines from *The Prophet* quoted at Colorado Springs come from the eighteenth section, "On teaching":

"Then said a teacher, Speak to us of Teaching.

"And he said:

"No man can reveal to you aught but that which already lies half asleep in the dawning of your knowledge.

"The teacher who walks in the shadow of the temple, among his followers, gives not of his wisdom but rather of his faith and his lovingness.

"If he is indeed wise he does not bid you enter the house of his wisdom, but rather leads you to the threshold of your own mind.

"The astronomer may speak to you of his understanding of space, but he cannot give you his understanding.

"The musician may sing to you of the rhythm which is in all space, but he cannot give you the ear which arrests the rhythm nor the voice that echoes it.

"And he who is versed in the science of numbers can tell of the regions of weight and measure, but he cannot conduct you thither.

"For the vision of one man lends not its wings to another man.

"And even as each one of you stands alone in God's knowledge, so must each one of you be alone in his knowledge of God and in his understanding of the earth."

Mr. Gray then introduced Dr. Clark as follows:

Ten thousand people cross the threshold of the Hospital every day, 23,000 patients are cared for during the year, emergencies such as the polio epidemic of a year ago have to be met, and new buildings must be built. All in all, the M.G.H. is a busy place and its General Director a busy person, not only in the running of the Hospital but also in responding to requests from the outside — such as his service on a Presidential Commission a few years ago to survey the health needs of the nation. I suspect that this new building is the apple of Dr. Clark's eye, and we have asked him to tell us what it will mean to the Hospital.

Dr. Clark's address:

The Warren Building is a reality today. The months and years of planning and construction are over and the activities in the new building are progressing steadily. The vision, cooperation and generosity of many people, both within the Hospital and outside, have made possible this latest achievement in the development of the Massachusetts General Hospital.

Even as we contemplate this most recent accomplishment with just pride and gratitude, we realize that we cannot stand still, we must constantly move forward to advance the tradition of service to humanity to which the Massachusetts General Hospital has been dedicated for nearly a century and a half.

Although the physical plant of the Hospital has grown from a single building to more than twenty, each designed and equipped for its particular function, the original objectives of the Hospital remain unchanged today except as they are expanded to meet the broader horizons of present-day medical care. These objectives are to care for the sick, to provide for the training and teaching of future doctors, nurses, and other professional workers in the health field, to encourage research, to advance the development of new knowledge and methods of preventing disease, to extend the Hospital's services into the community, and to assist the disabled to independence through rehabilitation.

The very age of some of the buildings points to the necessity for constant modernization. In June of 1950, at the request of the President of Harvard University for a description of future financial requirements, the Massachusetts General Hospital reported needs totalling $21,100,000. A survey made this past summer shows a total of $44,500,000 as a more accurate figure for future building and endowment requirements based on 1956 building costs. Of this only $1,000,000 would be utilized for new or additional beds. The balance is essentially for renovation and adaptation of the Hospital to its changing role in the community.

Mr. Gray then gave this introduction of Dr. Penfield:

We consider ourselves especially fortunate to have as our chief speaker on this occasion Dr. Wilder Penfield, Director of the Montreal Neurological Institute, whose work on the physiology of the brain has received worldwide recognition. In his earlier years and before he moved to Canada, Dr. Penfield played on the Princeton football team, was a Rhodes Scholar, was blown up on the *Sussex* during World War I, and received his training in the Presbyterian Hospital in New York. In his spare time he writes historical novels and currently is preparing one on Hippocrates. A member of the Royal Society in England and recently the recipient of the Order of Merit from Queen Elizabeth II, beloved and respected by all who know him, Dr. Penfield is universally regarded as the most distinguished neurosurgeon in the British Dominions.

Dr. Penfield's address:

The Reverend Robert Barry has asked a blessing on this new building and on the hands of those who work in it. What is there that I can say? My thoughts were expressed so well 3,000 years ago by the writer of Proverbs, in words that will never die:

Wisdom hath builded her house, she hath hewn out her seven pillars:

I wisdom dwell with prudence, and find out knowledge of witty inventions.

Come, eat of my bread, and drink of the wine which I have mingled.

For by me thy days shall be multiplied, and the years of thy life shall be increased.

There are many paths that lead to the house that wisdom builds. Walter Cannon in the last years of his life spoke of the wisdom of the body. It is this wisdom that we must hope to understand. But animal physiology is not enough. There is a wisdom, too, of the mind.

Some say that the mind and the body are one, and some say that they are two but joined together in a mysterious union. But whatever the monist may believe, and however the dualist may integrate biological fact with religious belief, each must approach his scientific work objectively, without prejudice or bias. For both of them, I believe, the final words of the author of Proverbs have deep meaning:

The fear of the Lord is the beginning of wisdom.

And there is another wisdom that we should consider carefully in these troubled times—the wisdom of man's behaviour. Considering this, medicine may well look abroad to wider horizons, taking her proper responsibility with religion and education, law and politics. Behaviour and misbehaviour are, in certain sense, no more than function and derangement of function in body and mind.

These three things we must study and must learn to understand: Man's body, his mind, his behaviour — three aspects of one central problem, a problem that belongs in the house of the seven pillars where wisdom may be found, even medical wisdom. It is for us to gather knowledge of normal structure and function. We must analyze disease, unreason, misbehaviour.

In this new building for medical science, certain special disciplines have places of their own. Pathology maintains the laboratory to which all clinicians should come to see their problems in retrospect. Neurologists, including, of course, neurosurgeons, may make direct approach to the brain, psychiatrists to mind and behaviour. The dermatologist will find his own peculiar pathway to the truth. His conclusions may also be profound, though his observations are only skin deep.

Sir William Osler gave the Shattuck Oration to the Massachusetts Medical Society in Boston in 1893. Afterward he wrote about the evening, as follows: "While the President was anointing the orator — looking over the 1200 men in the big Mechanics Hall, I received the impression that never before had I seen so large a collection of doctors with faces indicating breeding and pasture."

Yes, "breeding" and the ability to get the best out of your lovely New England pasturage characterize the men and the women in many walks of life here. We offered our best inducements, not long ago, to your brilliant neurologist and neuropathologist, Raymond Adams, hoping he would move to Montreal. Our plan of abduction failed, alas. But we understand many reasons why he preferred to remain here and wish him well, with James White and William Sweet and our other friends as they enter each on his own work in a sort of clinical institute in this new building so well integrated into the service of this great General Hospital.

It was in 1821 that Bostonians and their wives drove in horse and buggy along the banks of the Charles to see this Hospital open its doors for the first time — doors that have never been shut to the public, day or night, since then. How all the best people who had helped to build it must have admired the Bulfinch Building, with its curving dome and graceful white pillars rising above the river. It was a splendid monument to the generosity of those who could "indulge in the true luxury of wealth, and the pleasures of charity". This quotation is from the letter of James Jackson and John C. Warren — a letter described by James White, in a terse negative, as "too good not to quote."

It was more than a century later, in 1912, that the Hospital trustees opened the doors to medical science. They altered the East Wing then and established a "full-time teaching and investigative medical clinic" under the leadership of David Edsall. Edsall selected, from among the men he found on service, those who might serve his purpose: Walter Palmer, James Means, Paul White, George Minot. Those are illustrious names in the history of medicine now. Then, they were no more than house officers. If academic medicine had entered the Hospital at some earlier date, would it have discovered interns of the same potential ability? Must greatness depend on lucky chance and opportunity? Other brilliant names appeared in Edsall's department and in allied departments: Fritz Talbot, James Gamble, Joseph Aub, Louis Newburgh, Homer Wright, Roger Lee, Walter Bauer, Fuller Albright. Scientific medicine had moved in with "bag and baggage".

Ten years later, in 1922, came another memorable day, when a teaching and investigative clinic was established, and Edward Richardson as Surgical Chief set about farming out the well-selected young men who stood in his way. He sent them for special training in the basic sciences, as Edsall had done: Churchill, McIver, James White, Linton.

Then, after a short period, Richardson handed on his responsibility as Surgical Chief to Edward Churchill, and Churchill carried the plan along with great distinction, making physiology, pathology, bacteriology, endocrinology the part-time preoccupations of active operating surgeons. The plan has worked well, as Cope and Lyons, Allen, Smithwick, Freeman. McKittrick and other equally distinguished surgeons soon proved.

A special assignment scheme also met with remarkable success. Thus, Henry Beecher has brought basic research into anesthesia, Joe Meigs into gynecology. But the names that I should mention are far too numerous. Some have come to be household names among surgeons throughout the world: Jason Mixter. neurosurgeon; Smith-Petersen, orthopedist.

Was it a revolution during the last half century that I have been describing? Or was it the inevitable flowering of a hospital with a great tradition, backed by people who have always sought in all sincerity the best in life and thought?

The adoption of a satisfactory form of full-time practice for clinicians, called the Harvard Full-Time Scheme, certainly paved the way for better hospital practice. The planning of the trustees and their selection of the hospital directors — Howard, Washburn, Bigelow, Faxon, and Clark — were likewise most important.

But the outstanding feature of the introduction of medical science into medical practice here has been the remarkable cooperative effort of the Harvard Medical School with the Massachusetts General Hospital. It is not clear to me whether this means infiltration of Hospital by University or whether it is appropriation of University funds by Hospital! It is clear that no hospital could have done this without university aid and guidance, and no university could have introduced such effective research and medical teaching without such hospital opportunity and cooperation.

I have watched it all from afar. But at the same time I am no stranger here. Once, while I was in the process of deserting one mistress and was beginning to woo another, I spent a summer studying in the Dissecting Room at Harvard. The purpose of this apparent misuse of the summer months was to make me free to coach the Princeton football team in the autumn, without falling behind in my first year of medical training at Oxford. It was my good fortune to have Dr. Robert Green as my instructor. He introduced me to human anatomy and after the first week he coached me in Greek as well, doing it because he took such delight in the language. And so we had an hour of Greek each morning before we turned our attention to the cadaver.

Where else could a young man have found a physician who would prepare him for a Greek examination, as well as teach him anatomy? Educators sometimes seem to forget that medical science should not stand alone without the arts. All by itself, science is subject to a serious deficiency disease due to a lack of the vitamins which are found only in the humanities. It might be called Academic Avitaminosis.

And physicians in other places forget the importance of what Osler described as "breeding and pasture". I do not mean the indolence that is sometimes referred to as "graceful living". But "breeding and pasture" with plenty of hard work may help the doctor to do a good job in medical practice and to enter the house that wisdom builds.

I have other memories of Boston. I served a golden year as surgical intern in the Peter Bent Brigham Hospital while Mrs. Penfield, living near by, brought our second child into the world. I have given a series of University Lectures at Harvard — a terrifying challenge that turned into a very pleasant experience. Finally, most of my friends in medicine persist in living here in spite of everything that I can do: Stanley Cobb, Francis Hall, James White, and so many others!

Boston culture has provided leadership for American life and thought through strange and devious channels. In 1848, while anesthesia was having its difficulty with this city, Horatio Alger, Jr., the son of a Unitarian minister, was preparing to enter Harvard College. On admission he was shocked by the sin and saddened by the way of life in college. But he made a great discovery. Pluck and luck would bring any good boy to fame and fortune. It was a reasonable enough hypothesis, but little proof was produced and no scientific evidence. Also, it was somewhat overpublicized by 20 million copies of 135 juvenile novels! Many a self-made businessman who bears the name of Horatio Alger, Jr. on his crest might make a modest claim that his success proved the Alger, Jr. Thesis. But what of the control experiments? A scientist might ask whether some good Alger boys did fail.

The Massachusetts General Hospital was not always what it is today. It was luck with a good deal of pluck, rather than staff study, that led to the first use of ether in the operating room under the dome of the Bulfinch Building. It was a tribute to the character of Professor Warren that Morton came to him, of course. But there was no basic preliminary study, nothing like the years of thoughtful analysis that later led Lister, who might be called the first scientifically trained surgeon, to the secret of infection in the operating room.

Look into the Bulfinch operating room. A group of medical onlookers were present, expecting to jeer at humbug; Warren, dressed in sober morning coat, with mingled feelings of hope and mistrust in his heart; and Morton, the genius, in flamboyant waistcoat, with small mustache and glistening well-combed hair. He was a genius, no doubt of it, since he saw something to which the others were blind.

Chauncey Leake has told the story in cadenced verse:

"In silence and in awe they watched the Death of Pain, and were convinced.

"Said Warren, 'Gentlemen, this is no humbug.'

"Morton did not tell what he had used. Next morning all of staid old Boston was excited, for the news was in the papers,

"Yet Morton did not tell what he had used."

What a great discovery! and how badly handled!

Contrast with that the great discovery worked out by William Jason Mixter and his associates here just over a decade ago. They found the secret of the cause of the agony of sciatica and cervical neuralgia. But Mixter perfected the surgical cure quietly, modestly, scientifically. With no fanfare in the public press, he taught other neurosurgeons what to do. Here was the opening of a new field in surgery that has brought relief of pain to thousands. It was made possible by the scientific organization of this Hospital.

The discovery of the uses of ether in the Massachusetts General Hospital might seem to have been an accident. But I believe that Fate was marking out this Hospital for greatness. The compelling tradition of that discovery has been a potent influence in the subsequent evolution of this Chosen Hospital.

The future

It is my own belief that, in the future, it will be impossible to preserve the formal separation between medicine and surgery. Time was, of course, when the physician was superior in intellect and authority. He made the diagnoses and he directed the treatment. The surgeon, with reputedly clever and willing fingers, did what he was told. That time has passed. Physicians now conceal their feeling of superiority, except, I am told, in the privacy of "medical rounds".

Let me prophesy: In the future, hospital practice will be forced by the progressive advances, made possible by specialization, to pattern itself more and more according to the functional systems of the body.

For example: 1. The reproductive system — for clinician and basic scientist; 2. The respiratory system with physicians, surgeons, laboratory men; 3, 4, 5, etc. The visual and auditory systems; metabolism and endocrine systems; infant growth and care; digestive system; circulatory system; urinary system; bone-joint-muscle structures with arthritologist, operator, and gymnast; skin; and, finally, the nervous system.

You may build special institutes here and there. And I believe you should do so for the nervous system, since its problems are so vast and so important for the future of mankind. But, always, such institutes and such special units should be closely integrated into the body of a general hospital as you are proposing to do in this medical science building. Every practising specialist must strive for perspective so that he may understand what others can do. He must himself treat the whole patient, not the system alone.

These system units will develop according to the compelling force of the patients' needs, in the light that comes from the questioning of medical students in a teaching hospital, while the whole is cemented by the social service worker with the cement of human kindness.

Beyond that there will be an ever-increasing need for the general practitioner and family physician who is alert to every valid service that specialists can provide. This is a difficult role and he must be wise and alert. With national and local organization and development of recurring orientation courses for practitioners, they will return to the place of primary importance as family guides and advisors. Most of the ills and worries, from the cradle to grave, are better treated outside our hospitals.

There are many paths that lead to the house where wisdom "hath hewn out her seven pillars". Practitioner, Medical Scientist, Good Samaritan, and Educator must enter there where they may see the needs of fellow men in wise perspective.

[At one point, Dr. Penfield interrupted his address to say that at the Neurological Institute in Montreal they had succeeded in growing a few seedlings taken from the tree* under which Hippocrates carried on his teaching, and that he would be glad to send two of the seedlings to us at M.G.H., if we cared to have them, as he felt sure they would grow in our climate. He turned to those seated on the platform to get their reaction to his offer, and their nodded acceptance of this most unusual gift was underscored by hearty applause from the assembled guests. —— *Editor*]

*plane tree from Island of Cos off coast of Asia Minor

Following Dr. Penfield's address, Mr. Gray rose for his closing remarks. He said:

In closing this meeting may I say

First — we believe the most valuable contribution this Hospital can make is to march strongly forward under a staff having determination and vision and supported by modern facilities and equipment;

and

Secondly — we are ever mindful that bricks and mortar, laboratories and techniques are for one purpose and one purpose only — the patient, his care and his cure.

When the ceremonies were ended, the guests were invited to go on conducted tours of the new building. The building was also open for inspection from 10 A.M. to 6 P.M. the following day.

DEPARTMENT OF PATHOLOGY

Elsewhere in this issue are recorded the highlights of the dedicatory exercises of the Warren Building, in which the Department of Pathology is now comfortably ensconced. During the past month, it seems that all I have heard has been: It's about time; it was a long time in coming; you certainly deserve it; what a contrast; and many other similar remarks. Although we lived in the Allen Street building for sixty years, we were really not unhappy there. To be sure, there were no modern appointments, but there was a homeliness and intimacy that only age can bring. The benches were always full of microscopic slides. There was a mustiness and flavor that seemed to insure the correct diagnosis! Studies that have become medical classics were carried out in those rooms under James Homer Wright and Tracy Mallory. I trust we can carry on in their tradition.

To commemorate their names, the dedication of the James Homer Wright Pathology Laboratories and the Tracy Burr Mallory Memorial Library were held on Saturday, December 15. The main addresses were delivered by Dr. Fred W. Stewart, Pathologist at the Memorial Center for Cancer and Allied Diseases in New York City, and Dr. William Boyd, Professor of Pathology, *Emeritus*, University of Toronto. The portrait of Dr. Mallory was unveiled by Dr. James Howard Means. Greetings from the Trustees were presented by Dr. Arthur W. Allen; for the Hospital by Dr. Dean A. Clark, General Director; for the Harvard Medical School by Dr. Arthur T. Hertig, Shattuck Professor of Pathological Anatomy; and from the Armed Forces Institute of Pathology in Washington by its Director, Captain William M. Silliphant. These exercises were preceded by a morning scientific program presented by members of the Pathology staff. It was extremely pleasant to greet so many returning alumni of the laboratory.

Approximately 65% of the space in the three floors occupied by Pathology is for the routine diagnostic services — surgical pathology, post-mortem pathology, neuropathology, and cytology. The remaining 35% of the space provides us with what we woefully lacked — research laboratories. The latter can be classified into four general types: experimental (animal) pathology, histochemistry, microbiochemistry, and electronmicroscopy.

The experimental pathology laboratories are located in the basement, adjacent to the animal quarters. Here Dr. Winfield S. Morgan is expanding his studies on the Golgi apparatus. Dr. Morgan became interested in the Golgi apparatus when he spent a year with Dr. John Baker at the Zoological Laboratories at Oxford. Neutral red, when injected into the mouse, collects as granules in the acinar cell of the pancreas. These granules have the staining reaction of the Golgi apparatus. Dr. Morgan hopes to be able, by means of differential centrifugation to separate these granules and perhaps learn something about their biochemical properties and their relationship to the mitochondria and other cell elements.

Dr. Robert Scully became interested in the muscle changes following the repair of vascular injuries in soldiers during the Korean War. For example, the muscle injury caused by ischemia may be aggravated by sudden return of full circulation. He has already been able to produce changes in the dog similar to those in man. Histological and histochemical methods have been used so far, and it is anticipated that correlation with physiological methods will be used soon.

Dr. Scully has continued to maintain his special interest in gynecological pathology. Recently he has been concentrating on hyperplasia of the ovarian stroma, the response of the latter to the growth of neoplasm within the ovary, and the functional significance to both of these phenomena.

Dr. Austin Vickery continues his active interest in the thyroid, in which field there has been a stimulating and profitable association with the Thyroid Clinic. In particular, he has been studying the long-term post-radiation histological changes in the thyroid following I^{131} therapy for thyrotoxicosis and other non-neoplastic medical indications; the correlations of physiology and histology of metastasizing functional thyroid carcinomas and their response to radioactive iodine and other therapeutic agents; and, with Dr. Farahe Maloof, the mode and sites of action in the thyroid of isotope-labeled antithyroid drugs by their histological localization with special autoradiographic techniques. A collaborative investigation of nodular goiters is planned, with particular reference to relationships of biochemical function and histology of various nodules and the development and clinical detection of malignant tumors.

For some years, Dr. Castleman has been interested in the relationship of the thymus gland to myasthenia gravis, and has felt that this is probably an endocrine disease although extracts of the gland have not yielded any clues. Recently, Wilson in England conducted experiments which indicated the presence of a neuromuscular blocking agent elaborated by the thymus of myasthenia gravis patients. Dr. Sumner Zacks and Dr. Richard Cohen in our laboratory have repeated this work, using an isolated frog sartorius nerve muscle preparation to test the acetone extract of the thymus gland removed surgically from many myasthenia gravis patients. They obtained similar results, but showed that the potassium elaborated from the cells in the extract was really the agent responsible for producing the muscle inhibition. Because of considerable evidence in the literature suggesting a circulating or humoral blocking agent in myasthenia gravis, they are planning to continue the work, utilizing other methods of extraction and also testing sera of myasthenia gravis patients.

The Histochemistry Laboratories on the first floor are occupied by Dr. Agnes Burt Russfield and Dr. Richard Cohen. Dr. Russfield is studying the histological changes in the endocrine glands in patients with different types of cancer and various endocrine diseases. So far, attention has been concentrated on the changes of ratios of the various cell types in the pituitary associated with these diseases and on the changes produced in these ratios by hormone therapy. Histological findings in the pituitary have been correlated with gross and microscopic findings in the other endocrine glands. With our better equipped laboratory, it is planned to extend this research on an intracellular level, using histochemical methods correlating observations made with the light and electron microscopes and separating protein fractions of fresh glands by electrophoresis. The availability of animals may permit bioassay of glands and investigation of the physiological significance of anatomical findings.

Dr. Cohen is studying the relationship between adrenal cortical hyperplasia, benign neoplasia, and malignant neoplasia, utilizing routine morphologic and a series of histochemical techniques. Analogous studies in mice and rats have been planned. In both the human and animal material emphasis will be placed on investigation of transitional stages, if they exist, between hyperplasia and neoplasia. It is hoped that these investigations on the human and animal adrenal cortex may shed some light on similar relationships existing between hyperplasia and neoplasia in other endocrine organs, such as the parathyroid, thyroid, and pituitary.

The Microbiochemistry Laboratory is also located on the ground floor. Here, Dr. Edgar B. Taft, in cooperation with Dr. Jesse F. Scott of the Huntington Laboratories, will expand their microbiochemical studies of phosphorus metabolism in the rat liver to include the study of human liver and especially tumors of the liver. They have developed techniques which are, in essence, histologically controlled biochemistry. Sections of fresh frozen tissue are made in a cryostat, and certain of these are fixed and stained to serve as histological control for chemical and enzymatic measurements. They are able to measure ribose- and desoxyribose-nucleic acids, various phosphorus compounds in the acid-soluble fraction of tissue, and protein of these sections, as well as the activities of many hydrolytic enzymes. In addition, they can measure the dry weight of these sections. Using these methods, they have found a most interesting relation expressed in terms of protein between the ribosenucleic acid and the easily hydrolyzable organic plus the inorganic phosphates of the rat liver. This relation holds for all normal rat livers and all the non-tumorous changes induced in the rat liver by the azo dye butter yellow, but it does not hold for any of the tumors which result from the feeding of this dye. They have shown that this relation also holds for regenerating liver, for fetal liver, for liver from two-week-old rats, and for livers of rats in various states of metabolic stress. Thus, this difference appears to be a real means of differentiating tumors arising in the liver from non-tumorous, normal, and abnormal liver. They plan to investigate this relation in human liver disease. They are already embarked on an investigation of the metabolic significance of this relation in rat liver.

The field of analytic cytology embracing the techniques of electronmicroscopy, as well as polarization optics, x-ray diffraction, and analytical and physical chemistry, is making increasingly more numerous and important contributions. In view of the available knowledge concerning the above techniques and the structure and chemistry of many normal tissue components, it seems very timely to apply these methods to the study of fundamental aspects of cytology as related to pathology.

Realizing that this was one avenue along which pathology had to develop, we were very fortunate that Dr. David Spiro joined our staff two years ago while still working at M.I.T. Dr. Spiro, trained as an orthodox pathologist, decided to "tool up" and learn some of these newer methods of tissue study with Dr. Francis O. Schmitt of M.I.T. The aim of the program, therefore, is to set up an electron microscope laboratory devoted to the study of tissue ultrastructure, particularly as it bears on pathology. This is a long-range program, and at the outset it is planned to extend current work on the fine structure of muscle in order to support further Dr. Spiro's model of striated muscle. This model, which was the subject of Dr. Spiro's Ph.D. thesis, suggests a supercoiling of undenatured protein macromolecules as the basis of muscular contractility. An investigation of smooth muscle and several types of pathological muscle lesions will be initiated, and work on the developmental and other aspects of striated muscle continued. It is also planned to work on the kidney, with special reference to the elucidation of the ultrastructure of the renal glomerular basement membrane in both normal and pathological states.

The laboratory housing the electron microscope, located on the basement floor, was built with funds given to the Hospital by Mrs. Edwin S. Webster and has been named the Edwin S. Webster Memorial Laboratory in honor of her husband. The electron microscope and other major equipment were financed by the National Heart Institute of the U.S. Public Health Service.

All members of the Pathology Department were very pleased when Dr. Joseph C. Aub, now retired and free from administrative loads, joined our group. He now has a laboratory on the first floor, where he is investigating cell surfaces in cancer cells. He believes that some aspects of tumor cell growth can be explained in terms of abnormality to their surfaces. Following leads from studies of bacteria, he plans to study changes brought about on cell surfaces by the various families of detergents. Radioisotopes will be used to study changes in the permeability of cell membranes. He will use mouse and rat ascites tumor cells in these studies, as well as normal liver cells prepared by mechanical disruption of liver slices. It is really wonderful to have Dr. Aub with us!

At the other end of the age spectrum are two Harvard Medical School students who, after finishing their second year, are taking a year off to spend it in the laboratory as pre-doctoral fellows of the U.S. Public Health Service. They are learning what goes on in a pathology laboratory of a teaching hospital, and are spending more than half of their time on research projects. It is hoped that in this way some of the top students will be attracted to a career in academic pathology.

Benjamin Castleman, M.D.,
Chief of Pathology Department

On December 5, the laboratory staff of the Department of Dermatology presented an informal program covering the research projects in the laboratories. This was attended by guests representing the scientific staffs of industries and government agencies especially interested in problems of the skin. The meeting was held in the new laboratories of the department in the Warren Building.

During the day, the guests inspected the laboratories and had personal interviews with members of the staff concerning their work.

Following are the subjects discussed in the group meetings:

"Action of detergents on the skin", Irvin H. Blank, Ph.D.; "Enzymes of the epidermis", Robert D. Griesemer, M.D.; "Use of tissue-culture techniques in dermatology", Sabino J. Sinesi, M.D.; "Keratinization of the epidermis", A. Gedeon Matoltsy, M.D.; "Action of some topical antiseptics on the bacterial flora of the skin", Irvin H. Blank, Ph.D.; and "Clearing factor production by the intravenous administration of lipid emulsions", Walter F. Lever, M.D. and Edmund Klein, M.D.

* * *

Miss Ruth Sleeper, Director of our School of Nursing and Nursing Service, was honored at the Annual Dinner of the Massachusetts League for Nursing on November 14, at the Hotel Somerset.

Miss Sophie Nelson, formerly Director of Nursing at the John Hancock Life Insurance Company and formerly President of the National Organization of Public Health Nursing, was Toastmistress. She introduced the following guests at the head table, each of whom paid high tribute to Miss Sleeper: Dr. Oliver Cope, representing the Surgical Services, Massachusetts General Hospital; Miss Florence Flores, President of the Massachusetts State Nurses Association; Miss Ruth Freeman, President of the National League for Nursing; Miss Catherine Garrity, President of the Massachusetts Practical Nurses Association; Miss Stella Goostray, formerly Director of Nurses, Children's Medical Center, and formerly President of the National League for Nursing Education; Mr. Francis C. Gray, Vice-President of the Massachusetts General Hospital Corporation and Chairman of our Board of Trustees; Dr. Chester M. Jones, representing the Medical Services, Massachusetts General Hospital; Dr. Frederick M. Meek, Pastor at Old South Church; Dr. Ellsworth T. Neumann, Administrator, Massachusetts General Hospital; Dr. Howard F. Root, President of the Massachusetts Medical Society; Dr. Daniel A. Rubenstein, Deputy Commissioner representing the Massachusetts Department of Public Health; Mr. Dan Traner, President of the Massachusetts Hospital Association; and Miss Margaret Varley, President of the Massachusetts League for Nursing.

The highlight of the occasion was the awarding of the following citation to Miss Sleeper:

"The Massachusetts League for Nursing hereby honors Ruth Sleeper for outstanding leadership and distinguished service in nursing. Nationally and internationally, she is recognized as one who works for the improvement of nursing education and nursing services, that the needs of the people may be met. Generous in understanding, thoughtful of human values, steadfast in principles, sound in judgment, unbiased in her decisions, Ruth Sleeper is an able administrator and teacher, a wise and friendly counselor, and an effective interpreter of nursing."

A scientific exhibit entitled "Radiotherapy of carcinoma of the accessory nasal sinuses with consideration of an intracavitary multiple source treatment procedure" by Drs. Paul M. G. St. Aubin. Edward W. Webster, and Milford D. Schulz of our Department of Radiology won a Certificate of Merit at the Annual General Meeting of the American Roentgen Ray Society held in Los Angeles, California, on September 25-28.

Dr. Joseph W. Gardella, Assistant in Medicine on our staff, has been named Assistant Dean for Student Affairs in the Faculty of Medicine, Harvard University. Dr. Gardella will be responsible for academic and nonacademic aspects of student activities in the Medical School. He will work with faculty committees concerned with the revision of teaching programs and with the details of student loans and scholarships, military affairs, and student health.

Dr. Gardella succeeds Dr. William F. Ketchum, who is returning to private practice.

The Board of Trustees, at their meetings on November 16 and 30, voted:

To accept the resignation of Dr. Jerome K. Merlis from the position of Clinical Associate in Neurology;

To permit Dr. Joseph S. Barr, Chief of the Orthopedic Service, to appoint two men in excess of his present quota of resident staff, for the year beginning January 1.

To promote:

Dr. Phillips Hallowell from the position of Assistant in Anesthesia to that of Assistant Anesthetist, effective as of June 1, 1956.

To appoint:

Dr. Henrik H. Bendixen as Assistant Anesthetist, effective January 16, provided he obtains a permanent Massachusetts license;

Dr. Kiyokazu J. Momose as First Assistant Resident in Radiology, for the period November 1, 1956, through March 31, 1957;

Dr. Robert G. Ojemann as Second Assistant Resident in Neurosurgery for one year, beginning July 1;

Dr. E. William Rosenberg as Assistant Resident in Dermatology, beginning July 1;

Dr. Clinton B. Seeley as Second Assistant Resident in Radiology, beginning October 1;

Dr. Thorkild Waino-Andersen as Assistant Anesthetist.

At their meetings on October 31 and during November, the General Executive Committee voted:

That, as Dr. Charles M. Shugg would be returning to Australia soon after December 15, his appointment would be terminated as of that date, with thanks for his valuable services to the Hospital and best wishes for his continued success and happiness in Tasmania;

To change Dr. Melvin J. Glimcher's title from that of Clinical and Research Fellow in Orthopedic Surgery to that of Clinical Assistant in Orthopedic Surgery, with the privilege of assisting the patients of Dr. Joplin in the Baker Memorial.

To promote:

Dr. John P. Connelly to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Sylvia A. Davies to the position of Out-Patient Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Nathan H. Fearer to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Nathan T. Griscom to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Gerhard Nellhaus to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Renee B. O'Sullivan to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Philip J. Porter to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1.

To continue the appointment of:

Dr. William R. Buchanan, Jr. as Out-Patient Resident on the Children's Medical Service for one year, beginning July 1, 1956.

To extend the appointment of:

Dr. Yee P. Moon as Graduate Student Assistant in Orthopedic Surgery through November 30, 1956.

To reappoint:

Dr. Albert I. C. DeFriez as Clinical Assistant in Medicine for one year, beginning December 15, 1956;

Dr. Alexander N. Drescher as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1;

Dr. Susanne J. Lamdin as Assistant Resident in Anesthesia for one year, beginning September 20, 1956;

Dr. John T. Sharp as Clinical and Research Fellow in Medicine for one year, beginning December 1, 1956;

Dr. James L. Vanderveen as Clinical Fellow in Anesthesia for one year, beginning August 15;

Dr. Thomas J. Whitfield, III, as Chief Resident on the Children's Medical Service, through December 31.

To appoint:

Dr. Mary Bertucio Arnold as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1, 1956; her previous appointment as Assistant to the Children's Medical Service terminated as of June 30, 1956;

Dr. Mary P. S. Coley as Clinical Fellow on the Children's Medical Service, beginning October 25, 1956;

Dr. Luis L. de Mola as Graduate Student Assistant in Pathology, beginning November 1, 1956, and that he be appointed, in addition, as Clinical Fellow in Pathology if and when he obtains a temporary license to practise medicine in this State;

Dr. Hugh R. Dudley, Jr. as Clinical Fellow in Pathology, for the period October 18, 1956, through June 30, 1957;

Dr. Prisco T. Evangelista as Graduate Student Assistant in Surgery, for the period November 12, 1956, through June 14, 1957;

Dr. Marcia K. Iddles as Clinical Fellow on the Children's Medical Service, beginning November 1, 1956;

Dr. Zvi Laron as Clinical and Research Fellow on the Children's Medical Service, beginning November 10, 1956;

Dr. Haruo Matsuyama as Research Fellow in Neuropathology, for the period November 6, 1956, through February 28, 1957;

Dr. Richard A. Mayo as Clinical Assistant in Orthopedic Surgery for one year, beginning January 1;

Dr. Guan B. Ong as Graduate Student Assistant in Surgery, for the period November 12, 1956, through May 10, 1957;

Dr. Philip I. Salib as Graduate Student Assistant in Orthopedic Surgery, for the period October 29, 1956, through November 17, 1956;

Dr. José R. Solis as Graduate Student Assistant in Surgery, for the period November 12, 1956, through May 10, 1957.

* * *

Massachusetts General Hospital had reached 100% of its Red Feather quota by November 1 this year. When the campaign was over, 2,431 MGH donors (including 273 student nurses) had contributed a total of $10,811.39.

Due to the excellent work of the MGH-Red Feather Campaign Committee and solicitors, plus the usual spirit of the Hospital family, our goal was reached early.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Cardiology

Richards, D. W., Bland, E. F., and White, P. D.
A completed twenty-five-year follow-up study of 456 patients with angina pectoris.
J. Chron. Dis. 4:423-433.

Richards, D. W., Bland, E. F., and White, P. D.
A completed twenty-five-year follow-up study of 200 patients with myocardial infarction.
J. Chron. Dis. 4:415-422.

Dermatology

Matoltsy, A. G., and Herbst, F. S. M.
Observations on urea-extractable substance of the human abdominal epidermis.
J. Invest. Dermat. 27: 263-270.

Endocrinology

Benedict, P. H.
Use of estrogens in women after the menopause: Clinical note.
J. Am. M. Women's A. 11:399-402.

General Surgery

Waddell, W. R.
Effect of antrum exclusion on gastric secretion.
J. Appl. Physiol. 9:222-226.

Laboratory Science

Schmid, K.
Purification and properties of an a_2-glycoprotein derived from normal human plasma.
Biochim. et Biophys. Acta 21:399.

Waksman, B. H., and Adams, R. D.
A comparative study of experimental allergic neuritis in the rabbit, guinea pig, and mouse.
J. Neuropath. & Exper. Neurol. 15:293-333.

Waksman, B. H., and Bullington, S. J.
A quantitative study of the passive arthus reaction in the rabbit eye.
J. Immunol. 76:441-453.

Waksman, B. H., and Groupé, V.
Suppressive activity of xerosin on allergic and other inflammatory reactions of the skin in guinea pigs.
J. Immunol. 77:47-51.

Neurology, Neurosurgery, and Psychiatry

Benda, C. E., and Hoessly, G.-F.
Postnatal and natal cerebral injuries: Neuropathological and neurosurgical aspects.
A.M.A. Arch. Neurol. & Psychiat. 76:236-246.

Ophthalmology

Donahue, H. C.
An unusual case of an intraocular foreign body.
Am. J. Ophth. 42:642-645.

Orthopedic Surgery

Rowe, C. R.
Prognosis in dislocations of the shoulder.
J. Bone & Joint Surg. 38-A, no. 5:957-977.

Proctology

Hayden, E. P.
Medical progress: Proctology.
New England J. Med. 255:809-814, 854-860.

Surgery—Reconstructive

Cannon, B., and Murray, J. E.
Plastic surgery: Tissue and organ homotransplantation.
New England J. Med. 255:900-904.

Miscellaneous

Churchill, E. D.
The Harvard Medical School, 1906-1956.

MASSACHUSETTS EYE & EAR INFIRMARY

THE OCULAR MOTILITY CLINIC

Orthoptics is a relatively new branch of ophthalmology in this country. It deals with defective visual habits, defective binocular vision, and defective ocular motility. It is properly defined as the teaching or restoring of single binocular vision by means of graded exercises. Single vision, or fusion, is the ability of the brain to blend two separate images of a single object, seen by each eye simultaneously, into one image, resulting in binocular depth perception or stereopsis.

Orthoptic training can, by no means, be considered a cure-all for strabismus (or more properly, squint), but rather, a part of the treatment, which may include the wearing of glasses and/or surgery on the extra-ocular muscles.

This is a direct quotation from an article describing Orthoptics in "Orthoptic Clinic", which appeared in the October 1954 issue of THE NEWS. Since that time, there have been major physical changes in the clinic and it has acquired a new name — the Ocular Motility Clinic. This change of name was made in an attempt to eliminate the long-standing confusion resulting from the similarity between the words orthoptic and orthopedic.

The Orthoptic Clinic of the Massachusetts Eye and Ear Infirmary was opened in 1942, under the direction of Dr. Edwin B. Dunphy, Chief of Ophthalmology. It has grown steadily. All patients with strabismus (cross-eyes) who come to the Eye Clinic are referred to the Ocular Motility Clinic for evaluation. Disposition of each case rests with the Chief of the clinic. In 1948, a training school for orthoptists was started in conjunction with Simmons College. Since that time, twelve students have successfully passed the examinations of the American Orthoptic Council.

Originally, the clinic cared only for registered out-patients, but in June 1954, a private clinic was established, to which members of the visiting staff could refer their patients for evaluation, and for treatment, if indicated. The number of patients seen each year, both clinic and private, shows a steady increase. At the present time, the staff of the clinic consists of two full-time orthoptists, a student, and, for three afternoons each week, a resident in Ophthalmology.

With the growth of the clinic, the corresponding increase of staff and the addition of students, expansion of clinic facilities became necessary. The outstanding problems were lack of privacy during the examination of patients and lack of a teaching room. We were unable to obtain additional floor space, but during the past year an effective reorganization of the existing space was achieved.

The walls between the rooms were removed and sliding plywood panels were substituted, which, when drawn to their fullest extent, separate the area into five private examining rooms, each twenty feet in length — the standard length for vision testing. When these panels are pushed back, an area large enough to seat fifteen to twenty persons becomes available. Because of the small rooms, it was formerly impossible for the student orthoptists to have desks, but the reorganization provides a built-in counter of three student desks. The combination waiting room and secretary's office is separate.

The entire clinic was redecorated, the ceiling soundproofed, and bamboo draperies were hung at the windows, thus making the clinic a pleasanter place for patients and staff.

Pegboard equipment panels were installed on the wall of each vision lane, thus eliminating many tables and putting the equipment within easy reach of the orthoptist.

A helpful addition to clinic equipment is an improved device for after-image testing. This was devised by Dr. Trotter. The after-image test has long been employed as a method of determining the presence or absence of normal retinal correspondence — that is, whether or not the patient with strabismus could achieve single binocular vision if his eyes were straight. Formerly, this test was made by requesting the patient to cover one eye and fixate for thirty seconds the center of a horizontal lighted filament. The patient was then instructed to cover the other eye and once again fixate, this time on the center of a vertically positioned filament. In persons with a normal relationship between the two eyes, whether or not the eyes are straight, this test produces an after-image seen as a cross. If an abnormal relationship exists, the two lines of the after-image are separated. In such cases, establishment of single binocular vision after operation is much more difficult and often impossible. Because unwavering fixation on the center of the filament was required for a fairly long period of time, this test was often unsuccessful and unreliable with young children (the majority of our patients).

An electronic flash tube replaces the filament in our new test. Thus, only a split-second's fixation on the center of the flash tube is required; even inattentive young children can now cooperate. The after-image produced by this means is of such intensity and lasts so long (about twenty minutes) that the young patient can usually draw on a blackboard what he sees.

Dr. Trygve Gundersen has most generously given us a fifty-gallon aquarium, with a beautiful selection of tropical fish, for the waiting room. This is an unending source of delight and interest to the waiting children and their parents.

Ann E. Stromberg,
Orthoptist

VOLUNTEER GROUPS

MGH Staff Wives Association

The Music Committee of the MGH Staff Wives Association has arranged for two concerts in January, to be given in the Chapel. On Wednesday, January 9, at 3 P.M., three New England Conservatory students — Betsy Sheerin, soprano, Mary Monks, contralto, and William McKim, pianist — will offer a program of solos and duets. On Wednesday, January 23, at 3 o'clock, the MGH Nurses Glee Club, directed by Miss Margot Warner, will sing.

Distaff Club

Newly elected officers of the Distaff Club are:

President:	Mrs. Charles F. McKhann, III
Vice-President:	Mrs. Harold C. Urschel
Secretary:	Mrs. William L. Morgan, Jr.
Treasurer:	Mrs. Robert S. Harper

December was a busy month for the members of the Distaff Club. A bake sale was conducted early in the month and on December 18 Club members met to help wrap Christmas gifts for the patients in the Hospital.

The annual Christmas punch party for husbands and wives was given on December 12 in the Penthouse. This was a good opportunity for all of us to meet informally at a festive time of the year.

January plans include another evening devoted to getting acquainted. There are many new members who have recently been married or who are new to Boston. Therefore, the first meeting of the new year has been planned to provide an opportunity to welcome these new members.

New addresses:—

Dr. Charles B. Burbank (*W.S.* 1939), 94 Pleasant St., Arlington, Mass.; 270 Commonwealth Ave., Boston, Mass.

Dr. Evan Calkins (c.r.p. 1952), 74 Webster Rd., Weston, Mass.

Dr. Fa-Chi Dunn (a.r.p. *D.* 1954), 280 W. MacArthur Blvd., Oakland, Calif.

Dr. John B. Hartwell (*W.S.* 1905), 1520 Culebra Ave., Colorado Springs, Colo.

Dr. Edwin C. Hoodless (a.r.s. *Or.* 1952), Suite 415, Medical Arts Bldg., 1105 Pandora Ave., Victoria, British Columbia, Canada

Dr. Thomas C. Leinbach (a.r.s. *Or.* 1956), 1121 Penn Ave., Wyomissing, Pa.

Dr. Madan M. Singh (*M.* 1952), Gaya, Bihar, India

Dr. Louis L. Weiss (a.r.p. *An.* 1956), 1304 N. Delaware St., Indianapolis, Ind.

Dr. Alfred Yankauer (*C.M.* 1941), 84 Holland Ave., Albany 8, N. Y.

Brief bits:—

On October 3, at the Hotel Statler, Dr. Edwin F. Cave spoke before the Association of Surgeons of the New York Central Railroad on the subject "Recent advances in fracture management". On October 5, he addressed the New England Surgical Society, meeting at Poland Springs, Maine, on the subject "Delayed union and non-union of long bones".

Dr. Oliver Cope is to participate in the Postgraduate Course in Surgery at the University of Kansas Medical Center, Kansas City, January 21-24. He will speak on "The risk of surgical treatment related to the nutrition of the patient" and on "Recent developments in the treatment of burns".

Dr. Nathan B. Talbot delivered the Brenneman Lectures before the Los Angeles County Medical Society on November 7 and 8. His subjects were "Application of homeostatic principles to the care of patients with limited renal function", "The management of thyroid disorders in children", and "What does one see in a pediatric endocrine clinic?".

This short note from Brigadier General Richard Collins (*E.S.* 1933) will be of interest to his many friends:

> Thank you very much for writing in order to get my address and present condition of servitude correctly on the record. The above address — 202 West Glendale Avenue, Alexandria, Virginia — is my legal one and has been for the last five years or so. I would not go so far as to say that I have retired. It is true that I no longer practise medicine, but I am still on the active rolls of the Army.
>
> At present, I am in the Pentagon as Deputy Director of the Joint Staff for Intelligence. In short, I am the intelligence officer for the Joint Chiefs of Staff. The work is both important and interesting, so that I feel myself very fortunate. It is possible to get some very dull assignments in the Army.
>
> My best wishes to the Hospital and those who serve her.

* * *

The real meaning of Christmas could be felt in every corner and corridor of the Hospital during the entire holiday season this year. Special festivities included concerts and organ music in the Chapel, caroling in the halls and on the wards by glee clubs from local colleges and schools and our own nurses' groups, Christmas parties for children and grown-ups, and the student nurses' formal dance. The Beacon Hill Bell Ringers played Christmas music on the wards, and the nurses held their impressive Candlelight Service in the Moseley Rotunda.

Christmas is, perhaps, the most unfortunate time of the year to be in a hospital as a patient; but with all these activities, plus the Christmas decorations and gifts for every patient, as much of a home atmosphere as possible permeated every room and ward in Massachusetts General.

THE NEWS

1811

No. 164 Boston, Mass February 1957

PSYCHIATRY DEPARTMENT

We of the Department of Psychiatry are fortunate indeed to be able to look forward to an expansion of our research activities, as we expect to move the psychiatric laboratories to the sixth floor of the new Warren Building some time next summer. There it will be possible to develop our research program with adequate facilities, instead of being crowded together in the very small number of rooms on the third floor of the Bulfinch Building. At the present time much of our work is carried on by psychiatric interview techniques dealing with patients suffering from psychosomatic disorders. Drs. Blom and Long of the Child Psychiatry Division are seeking new information concerning the emotional aspects of asthma and rheumatoid arthritis in children, and Dr. Nemiah has investigated what type of personality predisposes to retarded convalescence of patients with orthopedic injuries. We also have a one-room unit for work in experimental psychology, in which Dr. Talland, together with Dr. Victor from the Neurology Service, studies changes in cognitive and other mental functions of chronic alcoholic patients. Finally, Drs. Saslow and Joseph Matarazzo are carrying out measurements of social interaction in a two-room unit located in the Clinics Building. As we obtain additional space in the Warren Building, it will be possible to develop a more comprehensive research program proceeding along four avenues:

1. Human ecology in psychiatry, where we are concerned with the distribution of mental illness and mental health in different types of populations.
2. Social science in psychiatry. Here we investigate the influences on mental health and illness emanating from other members of the groups in which one is forced to live and work—such as family, neighborhood groups, and work teams.
3. Psychophysiology, in which we study the internal milieu of the organism as it affects the central nervous system and behavior. Measurement of hormone levels in body fluids together with measures of cerebral irritability and of psychological functions will be made in the new laboratory, to secure much-needed information about the physiological control of behavior.
4. An expanded program in experimental psychology will help to develop methods of objective measurements of psychological performance and skills, which then will be of use not only in psychiatry but also to other departments of the Hospital—neurology, neurosurgery, and pediatrics.

It may be important to recall that under Dr. Stanley Cobb's leadership the Department of Neuropathology of the Harvard Medical School and the Department of Psychiatry at the Massachusetts General Hospital were combined into one unit. When Dr. Cobb retired, Dr. Raymond Adams, Head of the Neurology Service of the Massachusetts General Hospital, became Professor of Neuropathology at the Harvard Medical School, and a new Chair of Psychiatry was created by the University to make possible more vigorous development of the psychological and social sciences and their contributions to behavioral science in medicine. In order to implement such a program, we have developed preliminary plans for our work on the new research floor as follows:

1. Human ecology

Staff members involved in this program are, in addition to Dr. Lindemann, Dr. Gerald Caplan, Associate Professor of Mental Health at the Harvard School of Public Health; Dr. Peter Sifneos, a psychiatrist; Mrs. Laura Morris, M.A., a community organization worker; Dr. A. Paul Hare, a social psychologist; and Dr. Donald Klein, a clinical psychologist. Drs. Sifneos and Hare and Mrs. Morris are at present engaged in studying the population in the neighborhood of the Hospital. This group has four major objectives:

a. Studies in the distribution of mental ill health in certain areas of Metropolitan Boston, particularly in the so-called West End.

b. The development of screening methods for the appraisal of personality and mental health in the patient population of the Hospital and in the healthy population to which these patients give access.

c. Systematic studies of interpersonal behavior in groups of patients and healthy individuals with respect to the appraisal and development of social skills. This work will utilize the small group observation room to be described below.

d. The relationship of child rearing behavior of mothers of families in the neighborhood to the emotional development of their healthy and their sick children. We hope that this study will be correlated with the work in the Child Psychiatry Group and the Family Health Service.

2. Small group behavior study

At the present time research in the study of small groups is greatly hampered by the lack of adequate facilities. The new laboratory will provide space for research in group therapy, and for more systematic studies of the interaction of individuals in a small group setting. Group therapy is becoming an increasingly effective psychotherapeutic device, and research in group therapy will be applied to a wide variety of patient groups from the ward and clinic. The studies of interaction of individuals in groups are designed to provide basic information on the behavior of individuals in social situations, the roles they take, the skills they use, and the way in which individual personalities influence the group.

This laboratory will be used by psychiatrists and psychologists engaged in research in group therapy. Fellows and members of the staff will arrange to use the room one or more hours a week for this purpose. It is intended, however, that this work will merely provide a background for more specific research under the direction of our social psychologists: Dr. Hare and Dr. Talland.

The unit will consist of an experiment room and a long observation room adjoining it. The rooms will be entered from opposite directions, and there will be a one-way mirror and adequate soundproofing and sound equipment.

3. Biochemistry and human physiology

The Department of Psychiatry has been interested for some time in various aspects of psychosomatic research. We have, for instance, studied such illnesses as asthma, ulcerative colitis, rheumatoid arthritis, and neurodermatitis. We believe that the hypotheses we have developed should be further tested, not only by further separate but by combined psychological and physiological studies. The new research floor on Warren 6 will, therefore, have laboratories where physiological and associated biochemical studies can be carried out in conjunction with the psychological investigation. Recent advances in instrumentation make adequate laboratory space essential for this type of coordinated research.

The biochemical laboratory will be designed for flexibility so that a wide variety of procedures can be carried out, but it is not intended to provide space for basic research in neurochemistry. Recent developments in endocrine physiology and in neuropharmacology, however, make it highly desirable to have biochemical facilities available to a psychiatric service so that certain endocrine and drug effects can be studied. The laboratory will be used for a variety of routine determinations, using methods that have already been developed, but which will provide an essential service to the physiological investigation. In addition, space will be available for certain small-scale pilot studies that may appear to be fruitful, without demanding valuable laboratory space from other laboratories in the Hospital. This may be illustrated by a study now being pursued by Dr. Jack Mendelson.

A wide variety of hypotheses has been proposed to explain the fundamental mechanisms by which narcotics, convulsants, and hallucinogens are enabled to induce a number of stimulatory, depressant, or inhibitory activities. Results obtained in many investigations suggest two conceptual approaches to the factors (related to structural changes in the system) which are associated with the effective action of these compounds—the "physical" approach and the "chemical". The physical factors involve surface, membrane, and permeability phenomena; the chemical factors deal with the interrelationships and kinetics of energy-consuming reactions. On the basis of the data available at the present time, it would appear that the most logical view is what might be called "physicochemical". By the use of this term it is suggested that physical effects of drugs on the nerve cell membrane (Mullins, 1954), for example, are associated with and may be forerunners of chemical alterations in neuronal metabolism.

Numerous investigations have been carried out concerning the chemical alterations occurring in neuronal metabolism during narcosis and stimulation. However, relatively little information has been obtained on the effects of cerebral depressants and stimulants on the lipoprotein components of neuronal and mitochondrial membranes. The purpose of the present investigations will be an attempt to correlate the biological activity of a group of narcotics, convulsants, and hallucinogens with their effect on brain thromboplastin activity. Initial data have been reported demonstrating inhibition of brain thromboplastin activity (Schecter and Harrison, 1953) during narcosis. Thromboplastin has been selected as the initial lipoprotein for study because its activity in blood coagulation can be employed as a useful method of bioassay. In addition, specific thromboplastin components may be prepared from brain mitochondria and it is also possible to fractionate thromboplastin preparations to electrophoretically homogeneous units (Chargaff et al., 1949).

The basic experimental design consists of both *in vitro* and *in vivo* studies. The *in vitro* studies involve determination of changes in activity of total brain thromboplastin, brain mitochondrial thromboplastin, and fractionated brain thromboplastin in the presence of varying concentrations of narcotics and convulsants possessing differential biological activities. These studies will be coupled with electrophoretic and infrared studies to gain, if possible, information regarding changes in molecular structure. It is hoped that such coupled studies of bioassay and biophysical phenomena will aid in understanding the mechanism of action of narcotics and convulsants. The *in vivo* studies consist of injection of varying concentrations of the same drugs used in the *in vitro* experiments and administration of similar thromboplastin preparations with determination of any changes in activity. The experimental animals used for these studies are rabbits and mice.

The physiology laboratories will also be designed to be as flexible as possible. There will be a shielded room which will permit the use of sensitive recording devices, a general laboratory for observers and equipment, and rest rooms designed to make the patients comfortable during periods of observation and while waiting.

As an example of the type of work that is planned we might cite the investigation of the psychic effects of hyper- and hypothyroidism by Drs. Gardner Quarton and Howard Hermann. Such patients have been studied clinically, but there is no satisfactory explanation at present for the well-known changes in behavior seen with both overactivity and underactivity of the thyroid. The phenomena observed in myxedema are probably in part due to reduced cerebral metabolic rate. However, recent studies of hyperthyroid individuals seem to indicate that the cerebral metabolic rate is not elevated above normal. This means that we must consider other mechanisms. It may be that the phenomena are due to an augmentation of epinephrine or to effects on the sympathetic nervous system by the hormones of the thyroid. Some recent work suggests a synergistic action of thyroid and adrenal cortical hormones. We would like to develop a set of measures, some psychological and some physiological, that would permit the testing of these hypotheses. These measures must first be shown to discriminate between normal and thyrotoxic states. The search for such measures appears to be an ideal area for cooperation between psychology and physiology.

4. Experimental psychology

An experimental psychological laboratory is an essential unit in a psychiatric and neurological research center. Its primary purpose there is to test the validity of clinical observations, and of hypotheses derived from them, by applying more rigorous control than is practicable in the interview situation. The experimental psychologist's work in this setting may concern itself with diagnostic problems and the closer definition of nosological categories, with the principal and incidental effects of therapeutic methods and agencies, and with the patients' subjective responses to their various experiences in the course of hospitalization. This program includes basic psychological research, as well as projects especially designed round a closely circumscribed psychiatric or neurological problem—projects which are likely to be joint undertakings of experts in several disciplines.

The psychological program which is being developed at present by Dr. Talland is geared primarily to research in perceptual and cognitive processes. In studying mental illness, this means focussing on impaired capacities, e.g., accuracy of judgment, memory, ability to find solutions for problems, or consistent deviations from the norm which are of a habitual nature or learned, as well as those which are constitutionally determined. Characteristic traits in interpersonal behavior, as observed in the experimentally-created group, are also included in the research of our psychological laboratory. This kind of study includes analyses of the patient's self-perception in various roles and relationships, and also the more traditional study with the tachistoscope and similar instruments, along with tests of problem solving, learning, concept formation, and motor skills. A psychological study of Korsakoff's psychosis, conducted under the sponsorship of the Department of Neurology, and aimed at breaking down the clinically-observable symptoms of this disease into more basic psychological defects, offers an example of the type of research based on the experimental laboratory. We are planning a major research project on somewhat similar lines, with a view to determining the effects of aging on various perceptual and cognitive processes—a research so designed as to develop into a longitudinal laboratory study. Experimental techniques tested in these research projects will also be employed in studying the effects of addiction, of drug therapy, and of neurosurgery on perceptual and cognitive functioning.

The rest of the available space will be for offices for the individuals engaged in research. The space will permit five small offices, a secretarial office and waiting room area, and a conference room. The conference room will be divided by accordion walls so that it can be used most of the time as office space for research fellows.

As we develop our investigative program we will be much concerned with the training of young research psychiatrists who are well-versed in scientific methods and feel comfortable in working shoulder to shoulder not only with psychologists and social scientists, but also with clinical investigators in the fields of internal medicine and surgery and with the men who carry on studies in the basic biological sciences.

Erich Lindemann, M.D.,
Chief of Psychiatry Service

* * *

Friends of Miss Eleanore A. Lewis gathered in the Trustees' Room on the afternoon of January 4 for an informal reception given in her honor. Miss Lewis retired as Librarian of Treadwell Library the first of the year.

Dr. Dean A. Clark returned on January 14 from a 24-hour survey of damage to the Budapest Medical University and its related hospitals which resulted from the recent uprisings in Hungary. Dr. Clark went as a member of a 3-man team, at the request of the Rockefeller Foundation. Accompanying him were Dean Rusk and Dr. John Maier, President and European Medical Representative of the Foundation, respectively.

Reports of their findings as to medical needs in Hungary have been submitted to the Foundation; and Dr. Clark's impressions of conditions in Hungary, as given in an interview with the local press, are most interesting and enlightening—particularly when we realize that Dr. Clark is one of the few Americans to be permitted to pass through the Iron Curtain into Hungary.

* * *

An Open House, to meet the staff of the Medical Records Department and to inspect the new facilities and equipment of the Department, was held on the afternoon of January 15.

The Board of Trustees, at their meetings on December 14 and 28, voted:

That the title of Dr. Thorkild Waino-Andersen be that of Associate Anesthetist rather than Assistant Anesthetist, as previously recommended, effective as of November 16, 1956.

To reappoint:

Dr. W. Hardy Hendren, III, as First Assistant Resident in Surgery, beginning January 1;
Dr. Federico Mora as Resident in Neurosurgery, for the period January 1 through June 30.

To appoint:

Dr. F. Harold Brown as Acting Anesthetist at McLean Hospital;
Dr. David A. Drachman as Assistant Resident in Neurology for one year, beginning July 1;
Dr. Richard A. Field as Assistant in Medicine, beginning January 1;
Dr. William E. Karnes as Resident in Neurology for one year, beginning July 1;
Sidney Leskowitz, Ph.D. as Associate Immunologist in the Department of Medicine, effective as of October 1, 1956;
Dr. Paul R. McHugh as Assistant Resident in Neurology for one year, beginning July 1;
Dr. Hugo W. Moser as Assistant Resident in Neurology for one year, beginning July 1;
Dr. Lloyd H. Smith, Jr. as Assistant in Medicine, beginning January 1;
Dr. Walther T. Weylman as Second Assistant Resident in Radiology for one year, beginning January 1, 1958;
Dr. Irving Zieper as Assistant Resident in Neurology for one year, beginning July 1.

At their meetings on November 14 and 21, and during December, the General Executive Committee voted:

To conclude the services of Dr. Richard L. Rovit as First Assistant Resident in Neurosurgery, as of December 31, 1956. He goes to Lahey Clinic. It is assumed he will return on July 1.

To promote:

Saul Aronow, Ph.D. from the position of Research Fellow in Physics to that of Assistant Physicist (Medicine), effective as of December 1, 1956;
Dr. Roy J. Barry to the position of Resident in Radiology for one year, beginning January 1;
Dr. William R. Blade to the position of First Assistant Resident in Radiology for one year, beginning January 1;
Dr. John F. Burke to the position of Resident in Surgery, beginning January 1;
Dr. Ruth K. Freinkel to the position of Resident in Dermatology for one year, beginning January 1;
Dr. Egbert Mueller to the position of Resident in Psychiatry for one year, beginning July 1.

To extend the appointment of:

Dr. Soren Jorgensen as Clinical Fellow in Anesthesia for an additional three months, ending March 31.

To continue the appointments of:

Dr. Raymond N. Kjellberg as First Assistant Resident in Neurosurgery, for the period January 1 through June 30;
Dr. Alfred J. Luessenhop as First Assistant Resident in Neurosurgery at the V.A. Hospital, for the period January 1 through June 30;
Dr. John Mealey, Jr. as Second Assistant Resident in Neurosurgery, for the period January 1 through March 31, and as Assistant Resident in Neurosurgery at the V.A. Hospital, for the period April 1 through December 31;
Dr. Dagoberto Sosa as Second Assistant Resident in Neurosurgery at the V.A. Hospital for the period January 1 through March 31.

To reappoint:

Dr. H. Arto Aprahamian as Clinical Fellow in Anesthesia for one year, beginning January 1;
Dr. Gerald E. Davidson as Clinical and Research Fellow in Psychiatry for one year, beginning January 1;
Dr. Thomas P. Hackett as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Jack H. Mendelson as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Olcay R. Neyzi as Clinical and Research Fellow on the Children's Medical Service, for the period February 1 through June 30.

To appoint:

Dr. Carl J. Bridge as Clinical Fellow in Neurology for one year, beginning January 1;
Dr. Walter C. Cotter as Resident in Neuropathology, for the period January 1 through June 30;
Dr. Nancy A. Durant as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. John R. Hills as Fellow in Neuropathology for one year, beginning July 1;
Dr. Zenos McP. Linnell as Clinical Fellow in Psychiatry, for the period December 1, 1956 through June 30, 1957;
Dr. Fleming McConnell as Clinical Fellow in Radiology, effective January 1;
Dr. Naomi M. Morris as Clinical Fellow on the Children's Medical Service for one year, beginning January 2;
Dr. Frank Cesare as Clinical Assistant in Surgery, assigned to Gynecology, with the privilege of caring for Dr. Langdon Parsons's private patients in the Baker Memorial and Phillips House, effective as of November 1, 1956;
Dr. Edward J. Rosen as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Dr. Richard H. Smith as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;
Albert H. Soloway, Ph.D. as Research Fellow in Neurosurgery, effective as of November 1, 1956;
Dr. Alfred D. Surtees as Clinical Fellow in Anesthesia for one year, beginning May 1;
Dr. Franz Wendlberger as Clinical Fellow in Anesthesia for one year, beginning August 1.

A vote of September 5, 1956 was delayed in reaching us. On that date the General Executive Committee voted to appoint Dr. Walter Frommhold as Clinical Fellow in Radiology, effective January 1, 1957.

* * *

INFECTIOUS DISEASE LABORATORY

The Infectious Disease Research Laboratory was reopened last spring, following a hiatus of three years after the departure of Dr. Thomas F. Paine, Jr. to accept a post at the University of Michigan Medical School. The laboratory is located on the top floor of the Domestic Building, two floors above the Bacteriology Laboratory. The activities of the unit fall into two main categories: 1. Consulting service to the various departments in the Hospital concerning problems of infectious disease; 2. Research in the biochemistry of the host-parasite interrelationship.

The clinical work of the unit is closely integrated with that of the Bacteriology Laboratory, under the direction of Dr. Lawrence Kunz. One of our very first "challenges" was a Hospital outbreak of salmonellosis which involved the private services of the M.G.H. The alertness of Drs. Rita Kelley and Thomas Gephart in picking up the first cases and informing us, and the very excellent work of the Bacteriology Laboratory personnel under Dr. Kunz, led to the early detection of the cause of the outbreak and to its control. In an institution as large as the Massachusetts General many problems in preventive medicine inevitably arise—e.g., in the areas of food handling, water supply, laundry, cross infection, isolation techniques, etc. The Hospital administration has recently appointed Mr. Sumner Waitz to the position of Hospital Sanitarian to aid in the management of these problems.

Each month one of the assistant residents on the Medical Service rotates through the Infectious Disease Unit. In this way he gets an opportunity to see the problems of infection that occur on the various services. Visits to the infectious disease rounds of Dr. Finland at the Boston City Hospital and the rounds of Dr. Weinstein at the Haynes Memorial Hospital serve as valuable instruction for both the resident and the writer. The Boston area offers much in the way of infectious disease pathology—exotic as well as common. In the past few months the "unusual" has included cases of leprosy, anthrax, echinococcosis, North American blastomycosis, malaria, and typhoid fever, to mention a few.

Every year seems to bring to the fore at least one or two new antibiotics. Because of the large number of such antimicrobial agents now available, their selective usage has become somewhat complicated. In hospital practice the problem of antibiotic resistant organisms has become a very important one. Every six months a survey of the sensitivities of staphylococci and urinary pathogens isolated from Hospital patients is made and distributed to the staff. In this way it is hoped that we can keep abreast of any changes in "our MGH flora".

In studying the host-parasite interrelationship a model system that has been found to be extremely helpful is that of *E. coli* and the T group of bacteriophages (viruses which attack bacteria). Many of the fundamental steps in viral attack on a host cell in animal tissues may find their parallel in this experimental system. The mechanism of virus attachment to the bacterial cell, and, of even more interest, the means by which the virus usurps the control of the host cell's metabolic machinery, may be studied in such a system. We are particularly interested in the changes in certain small nucleotides which occur in the coli cell during the early stages of infection. The rapidity with which changes are produced in the bacterial cell is striking. Between 20 and 30 minutes after the phage particle has attacked, the host cell ruptures and approximately 200 new phage particles are released. They then proceed to infect other susceptible bacterial cells. What biochemical changes enable the phage particle to stop protein and ribonucleic acid synthesis of the coli cell and convert that cell to making primarily phage desoxyribonucleic acid are fascinating problems.

Although at first glance this type of problem seems far removed from clinical medicine, it is becoming clearer and clearer that some of the bigger problems in infections stem not so much from the inherent virulence of the pathogen but, rather, from the reaction of the host. This is true of certain bacterial infections such as tuberculosis, staphylococcal disease, brucellosis, typhoid, etc. By learning more about the intracellular changes which occur in such infections, perhaps the effectiveness of our attacks on these diseases will be improved. While talking about bacteriophages, it might be of interest to point out that one disease of man is known that is directly related to bacteriophage. Strains of Corynebacterium diphtheriae that produce the diphtheria toxin are all suffering from a latent bacteriophage infection. In some way this latent infection alters some of the metabolic products of the diphtheria organism, and one of these is the toxin that produces the clinical manifestations of diphtheria.

In collaboration with Dr. John Benson of the G.I. Group and Dr. Morton Weber of the Bacteriology Department at Harvard Medical School we have undertaken a study of the role of the intestinal flora in the macrocytic anemia which occurs in patients and also can be produced experimentally in rats following surgical production of blind loops of the small intestine. It is thought that the anemia, in some way, is due to an abnormal bacterial flora in the loops. We are studying the various microorganisms in the loops and assaying their ability to incorporate or split folic acid and vitamin B-12.

In summation, we might say that the seed of an Infectious Disease Laboratory has just barely begun to germinate. We hope to be able to gradually increase our services, in this area of medicine, to other departments in the Hospital.

Morton N. Swartz, M.D.,
Head of Infectious Disease Laboratory

Brief bit:—

Dr. Oliver Cope is to participate in the Congress on Medical Education and Licensure, to be held February 9-12 at the Palmer House in Chicago, under the auspices of the American Medical Association.

New addresses:—

Dr. David W. Allen (*M.* 1955), c/o Professor Linus Pauling, California Institute of Technology, Pasadena 4, Calif.

Dr. Richard C. Batt (r.p. *R.* 1940), 206 Glen St., Glens Falls, N. Y.

Dr. Germain J. Bouchard (clin. a. *U.* 1956), 9 Central St., Lowell, Mass.

Dr. Howard S. Colwell (*E.M.* 1916), 158 Whitney Ave., New Haven 10, Conn.

Dr. Ruth C. Haynes (a.r.p. *An.* 1955), 131 S. Grant Ave., Columbus 15, Ohio

Dr. Walter M. Haynes, Jr. (*S.* 1952), 131 S. Grant Ave., Columbus 15, Ohio

Dr. John F. Heggie (*M.* 1956), 20 Cleveland Ave., Glen Head, Long Island, N. Y.

Dr. Lucius C. Kingman (*W.S.* 1905), 130 Slater Ave., Providence 6, R. I.

Dr. A. Gedeon Matoltsy (assoc. biol. *D.* 1956), Rockefeller Institute, 66th St. and York Ave., New York 21, N. Y.

Dr. Richard A. Mayo (sr. r.s. *Or.* 1956), 264 Beacon St., Boston, Mass.

Dr. W. Pierce Smith (r.p. 1956), Veterans Administration Hospital, 150 S. Huntington Ave., Boston, Mass.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
A comparison of two systems of anesthesia for thoracic surgery: Ether versus thiopental-succinylcholine.
J. Thoracic Surg. 32:419-423, 474-480.

Beecher, H. K.
Evidence for increased effectivenesss of placebos with increased stress.
Am. J. Physiol. 187:163-169.

Dermatology

Tilley, R. F.
Medical intelligence: Contact dermatitis from chlorpromazine hydrochloride.
New England J. Med. 255:1046-1047.

Laboratory Science

Griesemer, R. D.
Change in enzyme activity and ribonucleic acid concentration within the epidermal cell of the rat during the growth stage of the hair cycle.
J. Biophys. & Biochem. Cytol. 2:523-530.

Orthopedic Surgery

Rowe, C. R., and Detwiler, R. C.
Fractures in the aged.
J.A.M.A. 162:1517-1522.

Physical Medicine

Watkins, A. L.
Medical progress: Physical medicine and rehabilitation.
New England J. Med. 255:1233-1239.

Psychology

Talland, G. A.
Role and status structure in therapy groups.
J. Clin. Psychol. 13:27-33.

BIOGLETS

Dr. Gardner F. Fay, Assistant Resident in Orthopedic Surgery — born in Boston, Massachusetts, May 1, 1926; Phillips Exeter Academy, 1941-44; U.S. Navy: Pharmacist's Mate 3/c, Okinawa, 1944-46; A.B., Harvard College, 1949; M.D., Columbia College of Physicians and Surgeons, 1953; Intern in General Surgery, Presbyterian Hospital, New York City, 1953-54; Assistant Resident in Surgery, Veterans Hospital, Boston, Massachusetts, 1954-55; Assistant Resident in Orthopedics, Children's Medical Center, Boston, 1955-56; married; one daughter.

Dr. Jack J. Greenberg, Intern in Surgery — born in New York, N.Y., April 5, 1931; A.B., Harvard College, 1952; M.D., Harvard Medical School, 1956; married; two sons; home: Miami Beach, Florida.

Dr. Nathan T. Griscom, Intern in Children's Medicine — born in Philadelphia, Pennsylvania, June 21, 1931; B.A., Wesleyan University, 1952 (*Phi Beta Kappa*); M.D., University of Rochester School of Medicine and Dentistry, 1956 (AOA); married; home: Marlton, New Jersey.

Dr. Robert S. Harper, Assistant Resident in Pathology — born in Worcester, Massachusetts, June 14, 1929; A.B., Harvard College, 1951; M.D., University of Pennsylvania, 1955; Intern, rotating, Pennsylvania Hospital, Philadelphia, 1955-56; married; home: Boston, Massachusetts.

Dr. John W. Josse, Intern in Medicine — born in Minneapolis, Minnesota, February 20, 1930; Pillsbury Academy, Owatonna, Minnesota, 1947; U.S. Army: Sergeant, Korea and

Japan, 1947-49; B.A., University of Minnesota, 1953; B.S., University of Minnesota, 1954; M.D., University of Minnesota, 1956; married.

Dr. Arnold M. Katz, Intern in Medicine — born in Chicago, Illinois, July 30, 1932; B.A., University of Chicago, 1952; M.D., Harvard Medical School, 1956; home: Chicago, Illinois.

Dr. Herbert E. Kaufman, Intern in Medicine — born in Brooklyn, N.Y., September 28, 1931; Peddie School, Hightstown, New Jersey; A.B., Princeton University, 1952; M.D., Harvard Medical School, 1956.

Dr. John Mealey, Jr., Assistant Resident in Neurosurgery — born in Providence, Rhode Island, August 30, 1928; A.B., Brown University, 1949; M.D., Johns Hopkins University School of Medicine, 1952; Intern in Surgery, Johns Hopkins Hospital, 1952-53; Captain. MC, USAF, Assistant Surgeon USAF Hospital, Loring AFB, Maine, 1953-55; Clinical Fellow in Neurosurgery, Harvard Medical School and Massachusetts General Hospital, 1955-56; married; one son.

Dr. Gerhard Nellhaus, Intern in Children's Medicine — born in Stettin, Germany, September 16, 1923; immigrated to U.S.A., July 1936; AAF gunner, then Air Force Aerial Intelligence (commissioned) and OSS, Italy and Austria, 1943-46; A.B., Harvard College, 1946; M.A. in Comparative Literature, Harvard University, 1946; served with the American Friends Service Committee at the Student Center, Freiburg, Germany, 1948; Fulbright Scholar, Sorbonne, University of Paris, France, 1949-50; M.D., Western Reserve University School of Medicine, Cleveland, Ohio, 1956; married; two children; home: Boston, Massachusetts.

Dr. William M. O'Brien, Intern in Medicine — born in Bethel, Maine, February 26, 1931; University of Maine, 1948-49; B.S., Tufts College, 1951; M.D., Yale Medical School, 1956; home: Bethel, Maine.

Dr. Philip J. Porter, Intern in Children's Medicine — born in New York City, September 15, 1931; graduated from Princeton University, 1952; M.D., University of Pennsylvania, Philadelphia, 1956; married.

Dr. Raymond L. Robillard, Assistant Resident in Neurology — born in Montreal, Canada, July 10, 1927; B.A., University of Montreal, 1947; M.D., University of Montreal, 1952; Intern, Hôtel-Dieu Hospital, Montreal. 1952-53; Graduate Research Fellow of the Canadian Research Council, 1953-54; Assistant Resident in Medicine, New England Medical Center, 1954-55; Assistant Resident in Neurology, New England Medical Center, 1955-56; married; one daughter; home: Outremont, Province of Quebec, Canada.

* * *

Of all the seagoing birds and mammals, whales are the most completely adapted to aquatic life. Although they must breathe air at the surface, they are capable of diving hundreds of fathoms at once, and of remaining submerged continuously for upwards of an hour. This performance is all the more remarkable considering the whale's huge oxygen requirement. Some facts and figures (from Scholander) will help to illustrate this: a 27 meter, 12,200 kg. (or middle-sized) whale has a surface area of 275 square meters, and a vital capacity of 3050 liters. His basal oxygen requirement is 36 liters per minute (or 179 liters of air per minute). If he dives without bestirring himself, and if he can use all his oxygen, he should be able to stay under water for a maximum of 17 minutes. His observed submersion for an hour is therefore impossible except by some sort of special adaptive mechanism.

Whales must be met and studied in their own habitat, and consequently next to nothing is known about them from direct observation. It seems unlikely that they will ever find their way into a laboratory, especially a dry-land laboratory. In fact, a whale out of water promptly dies, as his great bulk collapses his lungs when the buoyancy of the ocean is removed.

Dr. Lot B. Page and friend

Fortunately, the whale is not the only warm-blooded animal in the sea. There are diving birds and other mammals such as beavers, muskrats, and seals. Of these, the seal is the closest kin to the whale, and is capable of physiological acrobatics that are nearly as impressive as those of the whale. A small seal, weighing 25 or 30 kg., can submerge for 15 minutes with ease, and up to 30 minutes under stress, emerging at the end of that time unruffled and only a little dyspneic. This feat is made possible by the activation of a "diving reflex" which, as shown by Scholander and Irving, is shared by all the aquatic birds and mammals. In the seal, the reflex is well developed and has widespread effects: heartrate drops to 10 or 15 beats per minute; peripheral blood flow stops, and visceral blood flow is reduced to a trickle. Only the cerebral blood flow remains unimpaired. Hence, for the duration of the dive, the seal becomes a "heart-brain" preparation.

There are many intriguing facts about the diving mechanism which are still unexplained and unexplored. The water balance of seals and the effects of diving on kidney function formed the basis of studies which have been carried out by Dr. Homer Smith's department of physiology at N.Y.U. I joined this department in 1950 and spent several summers at Mount Desert Island, together with other members of the department, pursuing seals both in and out of the laboratory.

The animals which we used for our experiments were the harbor seals, which are abundant along the coast of Maine. These seals are of no commercial value, and are regarded as major nuisances by fishermen because of their habit of tearing up nets in their pursuit of fish.

During the first summer, the seals were provided for the laboratory by the Sea and Shore Fishery Station at Boothbay Harbor. After that, we began to catch them ourselves, or rather, to let them catch themselves. The technique of capturing seals is a little absurd. It consists of finding a colony of seals, and stringing a stout net in the water somewhere close by. This is done as conspicuously and noisily as possible. The young seals gather round and watch while this is going on. When the net is left alone, they can hardly wait to examine it, and get themselves all tangled up in it. As soon as a seal is caught, the net begins to lurch and splash. The seal must then be extricated as quickly as possible to make room for another one. A seal that is left in the net for more than 4 or 5 minutes seems to forget his diving reflex and is usually drowned.

It is only the young seals that are caught in this way. The adults are either too wary or too lazy for this kind of game. This is fortunate, since the adults attain a weight of 400 to 600 pounds and would make quite a netful to handle if captured. Our captured seals were brought back to the laboratory dock, where they were kept in wooden cages partly immersed in the ocean, and provided with platforms for sunbathing. The "trained seals" of circuses are, of course, not seals at all, but sea lions. They are the intellectuals of the phocine world, and the true seals, by comparison, are moronic. In captivity they spend most of their time basking in the sun, or floating lump-like in the water. They are easily scooped out of the cages with a large dip net, which they stare at vacantly and without recognition even after months of captivity. In fairness to the seals, it should be added that their eyes are refracted for underwater vision, and they see less well on the surface. Perhaps they are not stupid — just nearsighted.

Most young seals are quite tame, and never offer any complaint except a wailing cry that sounds like "No! No!". A few, especially the older ones, are quite treacherous and will bite without warning or provocation. However, they are quite helpless out of water and, with a little practice, it is easy to handle them in a way which makes biting impossible. During my first summer at the laboratory we had a particularly large, active, and vicious seal — a yearling female, to which everyone was very respectful. Each time she was taken out of the cage and brought to the laboratory, 4 men were required to keep her neutralized until she could be put in restraints on an animal board. One day, late in the season, no one was available to help me when the time came to take her out of the cage. Full of confidence from several months of experience with handling seals, I reached in with the dip net and started to hoist her out. Instead of settling into the bottom of the net as the others did, she climbed over the rim and pitched herself out as I brought her toward the dock, knocking both of us into the ocean. I had my arms around her as though dancing when we fell, and in the skirmish that followed I got a scissors and headlock on her from behind. We had a long and disagreeable fracas, during which she wanted to go under water and out to sea, and I wanted to go up to the top and back to shore. She had the

No. 63 in a series of Staff photographs
Dr. Morton N. Swartz—Head of Infectious Disease Laboratory

tide on her side and most of the time we were in 8 or 10 feet of water. Fortunately, help finally arrived and our side won.

As experimental animals, seals are far from ideal. Despite their remarkable viability in the water, they seem to be quite fragile, and often curl up and die with the least provocation. Our experiments usually involved venepunctures, bladder catheterization, and passage of a Levin tube. Each procedure was a minor crisis, with everyone fearful that the seal would decide to die. This was especially true of water-loaded animals, which often developed seizures, presumably from water intoxication, if they became excited. Between procedures, however, they appeared to be their usual sleepy selves. "Diving" the seals during experiments proved to be quite easy, since all features of the diving reflex could be elicited by holding the animals' noses.

The attrition rate of experimental animals was usually high enough so that there were only a few living seals to dispose of at the end of a season. It was always a temptation to liberate the survivors, but autopsies were a necessary part of the experimental program. Perhaps I should close with a short description of a seal's viscera, which are as absurd as everything else about the animal. In brief, all the organs are much too large. The heart, liver, and kidneys of a 25 kg. seal are equivalent in size to those of an adult human. There are also a number of large, tortuous, anastomotic veins in the retroperitoneal area, leading into an inferior *vena cava* which is often over 3 inches in diameter. At the level of the diaphragm, the *vena cava* is encircled by a sphincter-like muscle. All these accessory venous structures are probably of importance as a device for pooling blood during diving.

There were those among us callous enough to sample seal meat and declare it edible, but I can only report this as hearsay.

Lot B. Page, M.D.,
Clinical & Research Fellow in Medicine

VOLUNTEER GROUPS

MGH Staff Wives Association

The Music Committee of the MGH Staff Wives Association has arranged for two concerts in February, to be given in the Chapel at 3 P.M. On Wednesday, February 6, Phyllis Hardy Blodgett, contralto, gave a program of vocal selections, accompanied by Richard J. Reynolds at the piano. On Wednesday, February 20, Barbara Lloyd, a student nurse who plays piano and organ, is planning a program to be given with other student nurses who sing, and play various instruments.

◆

A 6-weeks' Refresher Course for Graduate Nurses is being offered, without tuition, by the Massachusetts General Hospital. This Course — offered by the Hospital for the first time since 1952—began January 28. It is being given to encourage nurses to return to the active practice of their profession after a lapse of years. It is to be given at the Hospital 3 days a week. It will include class instruction and practice in the newer procedures, as well as discussions of modern methods of nursing care and of medical and surgical care.

The Massachusetts General Hospital, like many other hospitals today, is faced with the problem of adequately staffing the floors. From time to time nurses who, for various reasons, have been out of active nursing, inquire about the possibility of a refresher course here at the Hospital. Approximately one-third of the graduate nurses working at M.G.H. today are married, and many of them have children.

Applications for and inquiries about the Refresher Course should be made to Mrs. Daley, Personnel Office, Massachusetts General Hospital. Mrs. Daley's telephone number is LAfayette 3-8200, Extension 607.

Items having to do with the history and development of Massachusetts General Hospital — such as portraits, certain pieces of furniture and equipment, etc. — are recorded in our Archives Department, together with their locations. Many of these items have been removed from time to time and placed otherwise, albeit with the best of intentions but to the utter confusion of your archivist. As an illustration of what we mean — on one occasion a visitor from far away made a special trip to the Hospital to see a certain portrait. We escorted her to where the portrait had been hanging for many years, only to find, to our embarrassment, that it had disappeared. After many, many days of fruitless searching and inquiry, we found that the portrait had been taken out to McLean Hospital.

As a result of this and similar experiences, it was decided that printed gummed labels should be attached to certain items in the Hospital. These stickers carry a small copy of the Hospital seal and read:

> This item is recorded in the Archives Department as being in this location. It is not to be moved without prior consent of the Archivist.

Dean A. Clark, M.D.,
General Director

THE NEWS

No. 165 Boston, Mass March 1957

NEUROPATHOLOGY LABORATORY

All of us who are concerned with the illnesses that beset mankind are continually impressed with the extremely difficult and complex problems which are presented by the diseases of the nervous system, many of which are still far from solution. A large amount of the time and activities of any medical center such as the Massachusetts General Hospital must, therefore, of necessity be devoted to nervous disease in the broadest sense. Thus, special services in neurology, neurosurgery, and psychiatry have grown up in close association with their parent branches of general medicine and surgery, and their continued growth is clear evidence as to their necessity. But any rational approach to clinical problems must be based upon as thorough an understanding as possible of disease itself —the nature of disease processes, their mechanisms, their effects. Thus, pathology, whose basic concern is the anatomical substratum of disease, must always be the strong foundation upon which clinical medicine and surgery can grow. Concomitantly, then, with the growth and expansion of the clinical services provided by this Hospital, there has been a parallel expansion and increase in the activities of the Department of Pathology. Because of the enormous complexity of the nervous system, and because of the more specialized techniques required for the study of its diseases, there has grown up within the framework of general pathology the younger science of neuropathology, which in turn forms the indispensable background for the understanding of nervous disease, and, therefore, the fundamental support for any rationally based science of neurology or psychiatry.

It was with these facts in mind that Dr. James B. Ayer, who was Chief of the Neurology Service at this Hospital from 1926 to 1946, with the approval and support of Dr. Tracy B. Mallory, late Chief of the Department of Pathology, was long interested in establishing a special laboratory for neuropathology at M.G.H. By a fortunate turn of events, Dr. Charles S. Kubik, who had just spent several years in clinical neurology at the National Hospital, Queen Square, London, and had also worked actively there in neuropathology under the guidance of Dr. J. G. Greenfield, came to Boston in 1926 to take on an appointment in psychiatry at the Boston Psychopathic Hospital. There he came to the notice of Dr. Ayer, who immediately invited him to found our new Neuropathology Laboratory. Dr. Kubik came to us in 1927, and has been the guiding spirit in neuropathological activities at this Hospital ever since that time. From its very beginning, the MGH Neuropathology Laboratory has been intimately associated with the activities of the clinical departments of neurology and neurosurgery; at the same time, the laboratory has from the first been equally associated with the Department of Pathology, of which it has always been an integral part. The close collaboration of these services, so wisely planned at the outset, has ever led to their mutual enrichment.

The beginnings were modest. Dr. Kubik recalls that he was given space to work in, and a microscope. For cutting tissue sections, he had to borrow a microtome, and he himself carried out the staining of the nervous tissues to reveal their intimate structure. Among the most precious items in the tremendously rich and varied collection of neuropathological material at this Hospital are preparations made with consummate skill and exquisite technique by Dr. Kubik — beautifully cut and stained sections which remain as examples and inspiration for those who have followed him in this work.

Eventually, Dr. Kubik did obtain a microtome for the newly created laboratory. It happened that one day he chanced to notice, hidden away under the seats of the old Pathology Amphitheatre and heavily coated with the untouched dust of many years, an abandoned microtome, which further inspection showed him was still serviceable and of a type particularly suited for cutting neuropathological tissue sections. This was resurrected from its dusty repository and it performed usefully for years until it finally was replaced by a newer model.

The years that followed clearly showed the farsighted wisdom of Dr. Ayer's choice of Dr. Kubik to head the new laboratory, and the good fortune of the M.G.H. in having a man of his abilities and personal qualities in this position. He eventually obtained the assistance of a highly skilled technical staff to aid him in the preparation of his sections — a group of exceedingly capable and devoted people, including Mrs. Jean Engborg, his first technician, who came in 1930 after receiving training in neuropathologic technique under Dr. Stanley Cobb at Harvard Medical School and who, after an interval of years devoted to the responsibilities of a growing family, returned in 1950 to give the laboratory the benefit of her special skills and still remains as one of its mainstays; Miss Virginia W. Towne, at present secretary to the Department of Pathology and assistant editor of the "Case records of the Massachusetts General Hospital" which appear in the *New England Journal of Medicine;* Mrs. Marie Reilly Tierney, who has lately returned to neuropathology to assist Miss Margaret Carroll in working on special problems for Dr. Raymond D. Adams; and Mrs. Klara Edwards, for nearly ten years chief technician of the Neuropathology Laboratory, to whom this laboratory has long owed a great debt of gratitude for ceaseless interest and conscientious work of the highest quality.

Under Dr. Kubik's guidance and active participation, the MGH Neuropathology Laboratory soon came to be one of the leading centers of neuropathology in this country. A number of fortunate physicians have been privileged to work with him for varying periods of time; many of them, now widely scattered in a number of teaching institutions, hold positions of leadership in neurology, psychiatry, neurosurgery, or pathology; all of them found in Dr. Kubik those qualities most prized in a teacher: clear thought, absolute honesty, sound observation and conclusions based on fact, not on fancy, and — with all this — kindliness, patience, and humor. Dr. Adams, now Chief of the Neurology Service at M.G.H. and Bullard Professor of Neuropathology at Harvard Medical School, received his start and first real inspiration in neuropathology under Dr. Kubik. Even after Dr. Kubik became Chief of the Neurology Service in 1946, on Dr. Ayer's retirement, he continued to take an active interest in the laboratory and to oversee its activities. It was during this period of time that the Trustees voted to establish a residency in neuropathology at M.G.H., and Dr. Mary Lorraine Gannon was the first to take on this post, in 1947. When the present writer returned to M.G.H. in 1949, after an interval of study in England, he was given the privilege of assisting Dr. Kubik in the laboratory, and, in frequent and close contacts with Dr. Kubik, developed an interest in neuropathology which has been of decisive importance in determining his subsequent career.

Not only did the Neuropathology Laboratory, under Dr. Kubik's leadership, afford an opportunity for the study of first-rate material with a wise, experienced teacher; it was also the source of a number of significant publications which have permanently enriched the medical literature. To name a few, the papers (with Dr. Adams) on the clinical and pathological features of basilar artery thrombosis, of pyogenic infections of the nervous system, including subdural empyema and influenzal meningitis, and, more recently, on the pathology of the demyelinative diseases, may truly be considered to be medical classics.

In 1951, Dr. Kubik retired from his administrative responsibilities and was succeeded as Chief of the Neurology Service by his former pupil, Dr. Adams. The writer took over the direct supervision of the MGH Neuropathology Laboratory. Very fortunately for us all, Dr. Kubik has continued his keen and active interest in our laboratory, and we all of us like to feel that he still considers the Massachusetts General Hospital as his principal professional home. It is always a happy occasion for us when he can afford us a little time, before he rushes off to his never-ceasing clinical responsibilities, to give us the benefit of his wisdom in informal conversations, and to help us when we encounter particularly difficult or perplexing problems. "What *is* this tumor?" we may ask; or, "What is the real meaning of the strange lesions we see in this case?" And the answers we get from him are always thoughtful, wise, thoroughly sound, and helpful.

As already mentioned at the outset, the concern of the Neuropathology Laboratory is the anatomical substratum of nervous disease. In a large general hospital like the M.G.H., with many active clinical services, an unparalleled opportunity is afforded to accumulate information on the effects on the nervous system of a very wide variety of disease processes, and to correlate this with the clinical facts. In accomplishing this purpose, part of the function of the laboratory is to check the accuracy of diagnosis and to aid in the correct classification of all material directly related to the nervous system that is removed at surgical operations. Much of the material removed in this way consists of tumors of the brain or spinal cord; for these, the Neuropathology Laboratory frequently is called on for rapid microscopic diagnosis during the course of a neurosurgical procedure, and its opinion is always sought for the final diagnosis. The largest bulk of the material studied in the Neuropathology Laboratory comes, however — as would be expected — from nervous tissue removed at post-mortem examination. In this regard, the Neuropathology Laboratory is responsible for the removal and preparation of appropriate tissues, and eventual diagnosis, on every autopsy performed by our Department of Pathology. For this purpose, a schedule is made up each month by the resident in neuropathology, so that there is a member of the neuropathology staff on call every day for whatever post-mortem examinations may be performed on that day. In many cases, an examination of the brain alone suffices, but in any instance where several levels of the nervous system may have been involved by disease, it may be necessary to obtain a very large sampling of material, including brain, spinal cord and roots, sensory ganglia, and muscles —an undertaking of major proportions, as will be realized by anyone who has attempted this.

Another function of the laboratory is to provide consultation service on already prepared sections, or to prepare and examine material from the nervous system, on cases coming to autopsy in other hospitals. Thus, for a number of years, our laboratory has from time to time had the opportunity of studying cases from the Boston Veterans Administration Hospital, and has obtained some of its most valuable material in that way. When the Lemuel Shattuck Hospital for Chronic Diseases was lately opened by the Commonwealth of Massachusetts, and Dr. Adams was appointed Chief of the Neurology Service there, an arrangement was made whereby neuropathological material of interest would be examined by our laboratory. In this way, we have obtained access to an even larger number of cases of chronic nervous system disease, which are particularly valuable for study and teaching. More recently, still another source of extremely significant and not otherwise easily accessible material in pediatric neuropathology has become available to us. In 1956, Dr. Philip R. Dodge, Assistant Neurologist on the MGH staff, was appointed by the Commonwealth as Neurological Consultant at the Myles Standish State School in Taunton, and through his efforts and the kindness of the responsible State officials, it has become possible for the MGH Department of Pathology to have access to all autopsies done at that institution. In this way, a vast field of congenital or acquired mental and neurological defects in infancy and childhood is opened up to our neuropathological investigations. In addition to these sources, we are very grateful to a number of hospitals, both inside and outside of Massachusetts, which have kindly sent us material from cases observed and treated at M.G.H., so that this final follow-up examination could be made.

Once obtained and appropriately fixed, the tissues from the nervous system are subjected to various embedding, sectioning, and staining procedures — each step requiring great skill and precision of technique, and each more or less time-consuming; then, a microscopical examination is undertaken. For obvious reasons, the examination cannot be equally detailed and thorough in every case, ideal though that might be on theoretical grounds. In many cases of ordinary interest, it must suffice to assess the nature and degree of a disease process with six to eight rapidly prepared small paraffin-embedded sections. In each of several cases every year, however, some hundreds of slides have to be prepared, with a variety of technical procedures being used, before any conclusion can be reached, and even then we often wish for a few more slides — a few more areas represented, a few more stains.

It may be wondered why it should be necessary to spend so much effort on the pathological examination of a single organ; yet it is quite apparent that the nervous system is itself made up of a large number of tissues, with interconnections of inconceivable complexity, and that a large number of areas must be examined in order to reach some idea as to the whole. Thus, the neuropathologist attempts, by the detailed microscopical study of the tissue sections, to gain some insight as to the presence of any disease process, and as to its nature. The cells and fibers that are disclosed by the microscope are dead, immobile structures; and yet, they are actors in a drama that are suddenly held still in the midst of their activity — in the midst of each pose or gesture — as in a photograph. It is the task of the tissue pathologist — and of the neuropathologist in this field of his activity — to infer, by means of his previous experience with other cases or with evidence of older or more recent stages of the disease process in the same case, what the scenes were that have gone on before, and what might have resulted had not the whole process terminated at that point. Viewed in this way, the scene may be that of a furious battle with hordes of cellular participants in various degrees of victory or defeat; or it may be more like a gradual, insidious decline and decay. Thus, in the mind's eye, the picture is no longer that of a dead stillness but, instead, of an active struggle between the forces of health and those of disease — the meaning of which may be readily apparent, or may yet defy interpretation. Or, it may be — as often is the case — that the florid manifestations observed during life are not reflected in any visible disturbances in the structures under scrutiny. This, too, must be discovered and understood. It must be admitted that there are disease processes which do not result in any changes that can be observed with the ordinary microscopical techniques at our disposal. Our methods are still inadequate to reveal subtle structural changes which must surely be present in many instances, and this must be an incentive to improve our techniques. Even then, it may well be that some cases of what could be called "disease" cannot be elucidated by any method of demonstrating structures, no matter how refined. This, too, we must know.

Apart from determining the detailed nature of disease in a given region, the neuropathologist must be concerned with the effects on conduction systems within the nervous system and on nearby or distant regions, and with the exact anatomical localization of the disease in question. Topographical localization is most accurately carried out in large sections including many areas on one slide, and on many such slides from the same case. For this purpose, the ideal method is to section serially the entire brain, as is done in the special problems under investigation by Dr. Paul Yakovlev and his fellow-workers at the Warren Museum, Harvard Medical School. Yet this method does not always lend itself well to the minute study of cellular pathology previously discussed. Thus, in any given case, we attempt in our laboratory to reach some compromise between elucidating the fine details of lesions and demonstrating their topography, and thus often obtain a variety of sections—some large, some small—to achieve both aims, fully realizing that emphasis of one of these aspects of neuropathology must always be at the cost of the other. Very happily for us, however, the technical facilities of the Warren Museum under Dr. Yakovlev have lately become available to us for cases requiring a more extensive investigation of topographical anatomy than our equipment permits.

The MGH Neuropathology Laboratory, so ably launched and set on its right course by Dr. Kubik, now continues under full sail into its 30th year. In the autumn of 1956 it moved, together with the Department of Pathology, into the beautiful James Homer Wright Pathology Laboratories, and is very appropriately situated in fine new quarters, in intimate relationship with the laboratories of general pathology on the second floor of the Warren Building. Administratively, the laboratory is, as it always has been and always should be, a part of the Department of Pathology, and thus its over-all head is Dr. Benjamin Castleman. At the same time, it is closely affiliated with the Department of Neurology under Dr. Adams, and from that department receives much necessary support. Dr. Adams, as Neuropathologist to the Hospital, and Dr. Kubik as Consultant in Neuropathology, provide the experienced, wise advice and guidance upon which the best functioning of the laboratory depends. The writer, as Assistant Neuropathologist, is responsible for the direct supervision of the regular activities of the laboratory. We are fortunate in having the faithful help of a fine team of technical assistants, now made up of Mrs. Klara Edwards, Mrs. Jean Engborg, Mrs. Beverley Hardacre, and Mrs. Hélène Tremblay.

In this setting, the Neuropathology Laboratory continues to carry out its work in service to the Hospital, in teaching. and in investigation. A sound basic knowledge of neuropathology is, as already emphasized, an indispensable background to adequate work in neurology and neurosurgery, and is necessary for general pathology as well. It can also be of great assistance in psychiatry. Thus, our laboratory has been fortunate over the years in having been able to participate in the training, and to have had the benefit of the hard work, of a considerable number of able physicians — men and women — from many countries, who have spent time with us. Several have gone on to important positions in other institutions. To name those from recent years: Dr. Howard S. English, Fellow in 1948-49, is active in the practice of neurosurgery in Utica, N. Y.; Dr. Rafael Estrada, Fellow in 1949, is established in neurology and neuropathology in Havana, Cuba; Dr. Remedios K. Rosales, our Resident in 1950-52, is now Assistant Professor of Neurology at Santo Tomás School of Medicine in her native city of Manila, P. I.; Dr. Ruth Stauffer, Fellow in 1950, is now Assistant in Neurology on the MGH staff; Dr. Raymond A. Adams, Fellow in 1950-51, returned to his home city of Richmond, Va., where he is now in charge of teaching in neurology at the Medical College of Virginia; Dr. Lawrence J. Barrows, our Resident in 1951-53, is now on the full-time staff in neurology and has started up a department of neuropathology at the Hospital of the University of Pennsylvania in Philadelphia; Dr. Philip R. Dodge, Fellow in 1951-52, was welcomed back here on the MGH staff in neurology in 1955, and continues his active work in neuropathology, with particular interest in nervous diseases in childhood; Dr. Carl F. Essig, Fellow in 1951-52, is on the staff at USPHS Hospital, Lexington, Ky.; Dr. Jerome K. Merlis, Fellow in 1952, returned to his post as Neurologist and Neurophysiologist at the Boston Veterans Administration Hospital, and, in 1956, was appointed Professor of Neurology at the University of Maryland Medical School, in Baltimore; Dr. Betty Q. Banker (now Dr. Betty Victor), our Resident in 1952-53, is a full-time staff member of the Department of Neurology at Boston City Hospital, under Dr. Denny-Brown, where she is doing basic studies on neuromuscular disease. Dr. O. Rhett Talbert, Fellow in 1951-52, is at present in charge of neurology at the Medical College of South Carolina, in Charleston, where he maintains an active interest in neuropathology; Dr. John N. Walton, Fellow in 1954, a neurologist from England, is now Neurological Consultant to the Royal Victoria Infirmary, Newcastle-upon-Tyne; Dr. Andres Rosselli, Fellow in 1955, from Bogotá, Colombia, has returned to the National Faculty of Medicine in Bogotá, where he teaches neurology and neuropathology; Dr. John O. Strom, Resident in 1954-55, has lately joined the neurology staff at Albany Medical College; Dr. Lowell W. Lapham, Fellow in 1954-55, has gone into full-time neuropathology in Dr. Alan Moritz's department of pathology at Western Reserve, Cleveland; Dr. Salomon Hakim, Fellow in 1954-56, after a long period of faithful and unusually able service at M.G.H., returned late in 1956 to his home in Bogotá, Colombia, where he will organize university teaching in neuropathology and neurosurgery; Dr. Françoise Robert (Robillard), who came to us from the University of Montreal as our Resident in 1955-56, is at present working in experimental neuropathology with Dr. Byron Waksman and Dr. Adams, and will continue in neuropathology as a future career; Dr. Pierre M. Dreyfus, Fellow in 1955-56, has lately begun work in quantitative histochemistry of the nervous system, in the research laboratories at McLean Hospital, under Dr. Alfred Pope; Dr. Cesare T. Lombroso, Fellow in 1955-56, continues his work in epilepsy and electroencephalography, at the Children's Medical Center, Boston; and during the first half of 1956, we were happy to have with us, as a Fellow for six months, a member of the Psychiatry Service, Dr. Thomas P. Hackett, who is at present a Fellow in Psychiatry.

In addition to providing training and experience for those planning careers in neurology or neuropathology, the laboratory also has participated regularly since 1951 in the residency training program of the Neurosurgery Service, whereby each of the residents in neurosurgery has a six-months' rotation in neuropathology. By arrangement with Dr. Castleman, the residents in pathology are assigned to neuropathology for what is now a minimum four-months' period. These workers in allied but not identical fields thus bring to our laboratory fresh points of view and stimulating ideas, for which we in neuropathology are grateful, indeed. Furthermore, the Tuesday afternoon Neuropathology Conferences ("brain-cutting sessions"), a regular feature of the laboratory activities since their initiation by Dr. Kubik in 1946, have continually drawn large audiences from the entire Boston area.

In the current year of 1956-57, our present medical staff consists of our resident, Dr. Elliott L. Mancall, who received his training in neurology at the Neurological Institute, Columbia University College of Physicians and Surgeons, New York City; and, as fellows, Dr. Miriam W. Carmichael, lately assistant resident on the MGH Neurology Service, who previously trained in internal medicine at the Medical College of Virginia, in Richmond, under our alumnus, Dr. Raymond A. Adams, and at the Neurological Institute in New York; Dr. Henry deF. Webster, recently resident on the MGH Neurology Service; Dr. Karl-Erik Aström of the Serafimer Lasarettet, Karolinska Institutet, Stockholm; Dr. Gilles Lyon of the Hospice de la Salpêtrière, Paris; and Dr. Haruo Matsuyama, a Japanese pathologist with the Atomic Bomb Casualty Commission in Tokyo, who is currently adding to his experience in neuropathology. This year, Dr. Allan McNie succeeded Dr. Sumner Zacks as the pathology resident assigned to neuropathology; and Dr. Richard L. Rovit, on the residency staff in neurosurgery, has been followed by Dr. Walter C. Cotter.

The investigative activities of the Neuropathology Laboratory at present cover a number of fields of great interest. First, precise and careful observations are being collected in the vastly important subject of cerebral vascular disease as part of a large-scale investigative project under the leadership of Dr. C. Miller Fisher, Associate Neurologist at M.G.H. and Assistant Clinical Professor of Neurology at Harvard Medical School, whose painstaking studies and great experience are a constant inspiration. The large topic of demyelinative disease of the brain as seen in human cases is under study, based on some exceptionally valuable and pertinent case material, by Drs. Aström, Mancall, and the present writer. Lately, this general field was the subject of an international collaboration between Dr. Paul B. Diezel of Heidelberg University, Germany, and the writer during the latter's six-months' stay in Germany in 1955 —work which included a histochemical as well as neuropathological study of some remarkable cases of degenerative diffuse cerebral sclerosis (leukodystrophy) from this laboratory. In collaboration with Dr. Philip Dodge, Dr. Lyon is studying some cases of metabolic encephalopathy occurring in childhood, as part of a far-reaching and extensive investigation of pediatric neurological disorders. The neuropathological aspects of the 1955 poliomyelitis epidemic are currently under review by Dr. Françoise Robert, who is finding a number of hitherto poorly recognized and little understood features of that disease process. The growth behavior of cerebral gliomas, with particular attention to their modes of origin and spread, is the subject of an extensive project under the direct supervision of Dr. Webster, with the aid of Dr. Yakovlev's laboratory at Harvard Medical School. Another large-scale project, in which basic neuropathological facts are being gathered, is a study of abnormalities of respiratory rhythm, including the Cheyne-Stokes variety, under Drs. Mandel E. Cohen, James Currens, Rhett Talbert (now in Charleston, S. C.), Wayne Hebertson, and the writer. Other work in progress includes Dr. Kubik's review of the clinical and pathological aspects of carbon monoxide asphyxia, for which he has gathered over the years an excellent collection of material; studies of a number of remarkable spinal cord syndromes, including chronic adhesive arachnoiditis following spinal anesthesia; and investigations of particularly interesting cases of progressive degenerative disorders of the brain resulting in varied abnormalities of mentation and motor performance.

We of the Neuropathology Laboratory are proud of our laboratory — of its history, its accomplishments, and of its potentialities. In the world at large, there are in fact very few laboratories or institutes that are equipped to do this fundamental work. We intend that the MGH Neuropathology Laboratory shall continue to be, as it has been, one of the foremost in this field of scientific activity.

Edward P. Richardson, Jr., M.D.,
Assistant Neurologist
and *Assistant Neuropathologist*

The Board of Trustees, at their meetings on January 11 and 25, voted:

That leave of absence be granted Dr. John W. Littlefield for one year, beginning January 1, to work in Dr. Roy Markham's laboratory at the Molteno Institute, Cambridge, England;

That leave of absence be granted Dr. Paul M. G. St. Aubin for a period of two years, in order that he may go to Japan with the Atomic Bomb Casualty Commission in their study of casualties and their offspring at Nagasaki and Hiroshima;

That official recognition be given to the fact that the Radiology Staff of the Massachusetts General Hospital is also the Radiology Staff of the McLean Hospital;

That permission be given the Distaff Club to use the name of the Hospital in connection with the subscription dance it is sponsoring for April 26.

To appoint:

Dr. Mauldin J. Boggs, Jr. as Exchange Assistant Resident on the Children's Medical Service, for the period January 7 through February 17;

Dr. Abdollah Gashgai as Special Intern on the Surgical Service, beginning July 1;

Dr. Robert J. Haggerty as Assistant to the Children's Medical Service, beginning January 1;

Dr. Walter G. Heimann as Second Assistant Resident in Radiology, beginning April 1, 1958;

Dr. Priscilla D. Taft as Assistant in Pathology, beginning January 1;

Dr. Herbert C. Wimberger as Resident at McLean Hospital.

At their meetings during January, the General Executive Committee voted:

To allow Dr. Robert P. Fornshell, Assistant Resident on the Orthopedic Service, to have a tour of duty at the Lemuel Shattuck Hospital, on a trial basis, for a period of six months, beginning January 1;

To allow Dr. Robert H. Hansen to serve two months on affiliation at the Children's Medical Center and one month on affiliation in obstetrics at the New Haven Hospital; this affiliation will mean that Dr. Hansen's appointment will be extended to a total of fifteen months, rather than one year;

To change the title of Dr. Margaret A. Single from Intern to that of Second Assistant Resident on the Children's Medical Service;

To rescind the vote passed on December 12, 1956, appointing Albert H. Soloway, Ph.D. as Research Fellow and to appoint him as Assistant Chemist on the Neurosurgical Service, effective as of November 1, 1956.

To promote:

Dr. Paul M. Black from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Norman K. Brown from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Leon I. Goldberg from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Edgar Haber from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. John W. Josse from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Charles S. Keevil, Jr. from the position of Assistant Resident to that of Resident in Medicine for one year, beginning July 1;

Dr. Frederick S. McAlpine from the position of Assistant Resident to that of Chief Resident in Anesthesia for one year, beginning April 1;

Dr. John A. Mills from the position of Assistant Resident to that of Resident in Medicine for one year, beginning October 1;

Dr. William M. O'Brien from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. James A. Rose from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Allan I. Sandler from the position of Assistant Resident to that of Resident in Medicine for one year, beginning July 1;

Dr. John D. Turner from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1;

Dr. Arnold N. Weinberg from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1.

To reappoint:

Dr. Winnifred P. Chase as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. William B. Clapp as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. Irving H. Itkin as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. Louis Kunian as Clinical Assistant in Medicine for one year, beginning January 1;

Renee G. Naves, Ph.D. as Research Fellow in Medicine, beginning February 1;

Dr. Raymond J. Savignac as Clinical Assistant in Medicine for one year, beginning January 1;

Dr. Richard J. Taylor as Clinical Fellow in Pathology, for a period of six months, beginning January 1;

Dr. Gordon D. Winchell as Clinical Assistant in Medicine for one year, beginning January 1.

To appoint:

Dr. György Acs as Research Fellow in Biochemistry, effective as of November 25, 1956;

Dr. Hedda Acs as Research Fellow on the Children's Medical Service, beginning January 10;

Dr. Frederick J. Duhl as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Laszlo L. Fekete as Research Fellow in Dermatology, effective January 23, and Clinical Fellow if and when he obtains a license to practise medicine in this State;

Liselotte I. Hecht, Ph.D. as Research Fellow in Medicine for one year, beginning January 1;

Dr. Eugene M. Joly as Clinical Fellow in Orthopedic Surgery, for one month, beginning January 1;

Dr. Jorgen A. Kirchhoff as Senior Fellow in Anesthesia, for a period of six months, beginning April 1;

Dr. Emil J. Pawlowski as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Marie Sadka as Clinical and Research Fellow in Neurology for one year, beginning January 1;

Dr. Maurice Thibault as Clinical Fellow in Radiology for one year, beginning July 1.

Rev. Paul R. Swanson has been appointed Associate Protestant Chaplain at Massachusetts General Hospital, under the sponsorship of the Lutheran Social Service of the New England Conference of the Augustana Lutheran Church Body at Large. Mr. Swanson's home is in Muskegon, Michigan. After serving for a year in a parish in Kansas, he came to Boston, and is now studying under an Augustana Centennial Scholarship at Andover-Newton Theological School, in the field of Pastoral Psychology.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on

Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Dermatology

Lever, W. F., and Lyons, M. E.
Idiopathic hyperlipemia and primary hypercholesteremic xanthomatosis. VIII. Effects of protamine on the electrophoretic and ultracentrifugal changes produced in the serum by heparin.
J. Invest. Dermat. 27:325-334, 1956.

General Surgery

Zuidema, G. D., Clarke, N. P., Prine, J. R., and Salzman, E. W.
An experimental study relating fabric types with severity of burns.
Surg., Gynec. & Obst. 103:581-589, 1956.

Oral Surgery

Trieger, N., and McGovern, J. J.
Plasma thromboplastin antecedent (PTA) deficiency and oral surgery.
Oral Surg., Oral Med., & Oral Path. 10:55-62, 1957.

Neurology, Neurosurgery, and Psychiatry

Benda, C. E.
Darwin und Freud. Zum 100. Geburtstag von Sigmund Freud.
Die Medizinische Nr. 35/36:1205-1208, 1271-1276, 1956.

Benda, C. E.
Mongolism: A comprehensive review.
Arch. Pediat. 73:391-407, 1956.

Cohen, S. I., Silverman, A. J., and Zuidema, G.
Physiologic stress response evaluation by focused interviewing.
A.M.A. Arch. Neurol. & Psychiat. 76:670-674, 1956.

Surgery — Reconstructive

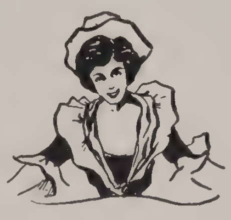
Kazanjian, V. H.
Bilateral absence of the ascending rami of the mandible.
Brit. J. Plast. Surg. 9:77-82, 1956.

Kazanjian, V. H.
Mandibular retrusion with ankylosis of the temporomandibular joint (Report of two cases).
Plast. & Reconstruct. Surg. 17:91-104, 1956.

Kazanjian, V. H.
Open bite deformities of the jaws — Surgical treatment.
Fortschritte der Kiefer- und Gesichts-Chirurgie 2:194-200, 1956.

Kazanjian, V. H., and Roopenian, A.
Median forehead flaps in the repair of defects of the nose and surrounding areas.
Tr. Am. Acad. Ophth. 60:557-566, 1956.

This is the last issue of The News in which 1956 titles will appear.



VINCENT MEMORIAL HOSPITAL

After its meeting on February 14, the Board of Managers of the Vincent Memorial Hospital presented to Dr. Joe Vincent Meigs the original drawing from which bookplates will be made for the medical library in the Joe Vincent Meigs Conference Room at the Hospital. The bookplate was designed by Mrs. Henry A. Morss, Jr., and the lettering was done by Mr. Edward A. Karr. The drawing was presented by Mrs. George Lewis, Jr., President of the Board.

Among those present was Mr. Charles F. Hovey, the newly elected Chairman of the Board of Trustees of the Vincent Memorial Hospital. He succeeded Mr. Louis Curtis at the Annual Meeting held February 13. Also attending the presentation was Mr. Henry W. Minot, Jr., who was elected a Trustee at the Annual Meeting. Mr. Minot replaces Mr. Charles B. Barnes, Jr., who has been Clerk of the Vincent Memorial Hospital for the past twenty-five years. Mr. Barnes has been an active member of the Board of Trustees of the Peter Bent Brigham Hospital for many years and succeeded Mr. Robert Cutler as President in April of 1955.

Dr. Meigs, who was Chief of Staff of the Vincent Memorial Hospital from 1930 to 1955, is now its Consulting Visiting Gynecologist and also Consulting Visiting Surgeon at the Massachusetts General Hospital. In addition to the Conference Room being named in his honor, money is being raised to endow a Chair of Gynecology at the Harvard Medical School — the incumbent to be known as the Joe Vincent Meigs Professor. The chairman of the Meigs Fund Committee is Dr. Maurice Fremont-Smith.

MASSACHUSETTS EYE & EAR INFIRMARY

AUDIOLOGY SERVICE OF THE WINTHROP FOUNDATION

Beginning with its establishment in 1940 as the center of a clinical research program in the field of deafness, the Winthrop Foundation has devoted a considerable share of its attention to the nonmedical aspects of deafness. With the recognition that a lion's share of the problems of deafness includes those cases which are not assisted by medical or surgical handling, interest spread to the psychological and educational ramifications of the problem. The Audiology Service is an outgrowth of this recognition.

Rehabilitation of patients with hearing impairment, regardless of whether the rehabilitation is medical, surgical, educational, or psychological, proceeds from competent diagnosis. Audiology — the science of hearing — deals primarily with the measurement of hearing impairment and the nonmedical considerations of rehabilitation. In addition to the role it plays in diagnosis, the Audiology Service also contributes to research and teaching programs of the Winthrop Foundation.

Testing of children

One of the most vital phases of the diagnostic program is the evaluation of hearing impairment in young children and infants. With the recent advances in technical and electronic equipment it has become possible to begin in the early preschool years the educational rehabilitation of the child afflicted with congenital deafness. Not too many years ago it was not considered important that deafness be recognized before the child was of school age, and nothing was done for him even in the face of early recognition. Research, however, including that of the pioneer study of the aural rehabilitation of preschool children, begun in 1942 at the instigation of the late Dr. Ruth Guilder of the Winthrop Foundation, clearly demonstrated the value of preschool recognition and training for the profoundly deaf child as well as the child with lesser hearing impairment.

Below the age of three years, testing of hearing becomes something of a problem. Obviously, when the child is old enough, it is possible to teach him to respond to sounds by performing tasks such as moving a bead or putting a peg in a hole. When the child is too young to associate the performance with the stimulus (sound), or if his behavior is such that he will not cooperate, techniques which do not require active participation on the part of the patient must be used. These techniques include reflexive responses to intense gross sounds, and psychogalvanic skin resistance audiometry (P.G.S.R.). This latter technique is a method which has developed in popularity since the application of two old principles (G.S.R. and conditioning) to auditory measurement in 1948. Despite its popularity, a considerable amount of concern has arisen recently over the reliability of the technique. This has been due to the high incidence of failure to elicit or maintain conditioning in the very young infant. The research program which we are now embarking on involves a detailed study of this technique, and is discussed below.

Understanding the whole child

Ultimate plans for rehabilitation of children are decided upon through conferences with otologists, psychiatrists, audiologists, educational psychologists, teachers, and social workers. In this way, the plan is worked out to fit individual needs.

Whenever there is residual hearing, it is the policy ultimately to recommend a hearing aid, although this is often preceded by a short period of intensive auditory training. In many cases, the residual is so slight that little more than noise comes through to the child. However, after years of training, he learns to give meaning to the noise. Although he may never understand speech on the basis of hearing alone, he can integrate lip reading and auditory cues, so that he will understand much more speech than if he had only lip reading to depend upon.

The tests and examinations given to the child when first examined are repeated from time to time, so that periodic medical, audiological, and educational evaluations may be made on his progress. The degree of hearing impairment is never the sole consideration. Other vital factors include psychological adjustment of patient and parent, availability of specialized training, age of onset, and intelligence. With a consideration of these factors the decision is then made as to the ultimate educational disposition — special school, special class in a regular school, or a regular class with additional outside assistance.

Psychological hearing losses

Another interesting facet of the work with children, particularly those of school age, has been the interesting problem of psychogenic deafness. In the past several years we have noted an increasing number of the children referred from school systems because of apparent hearing loss, as detected by the school hearing screening testing program, who appeared to have no organic loss. Instead, specialized testing reveals the hearing loss to be a somatic expression of some psychological problem. This discovery stimulated our staff to seek the advice and assistance of the Child Psychiatry Unit. As yet, our studies have been fragmentary and are still inconclusive. However, the lesson of caution before accepting a hearing loss as valid on the basis of superficial tests has been dramatically highlighted. The study of this problem is continuing as one of the areas of clinical research by the Audiology Service.

Service for adults

In addition to the testing and rehabilitation of children with auditory impairment, a considerable portion of the testing program involves the testing of adults. When surgery is ineffective or inadvisable, it becomes the job of the Audiology Service to counsel patients in selection and use of hearing aids and other rehabilitation procedures. Such counseling is considered important because of the oft-ignored fact that hearing losses are not "cured" by hearing aids. It should be recognized that there are a large number of people with significant hearing impairment who do not obtain benefit from hearing aids. In addition, some will obtain benefit, but it will not be sufficient from the patient's viewpoint to warrant the use of an aid. Thus, assets and liabilities of amplification must be discussed with the patient before specific purchase is made. Full appreciation of the hearing aid is always best accomplished when the patient also receives auditory training and speech reading. In order to assist the patients' achievement of maximum rehabilitation, these considerations must be brought to their attention.

The research program

Some of the clinical research carried out by the Audiology Service has been alluded to above. In addition to hearing testing, which serves as a basis of quantifying and evaluating improvement in hearing by a variety of surgical techniques, there is a continual attempt to evaluate and improve testing procedures, so that greater diagnostic assistance may be provided. In addition, a recent grant by the Deborah Munroe Noonan Memorial Fund has served to instigate the establishment of a coordinated and directed Hearing and Speech Research Project, the ultimate aims of which are to improve the methods of diagnosis of hearing loss so as to foster prompt and efficient medical and/or educational rehabilitation for young children afflicted with problems of deafness and resultant speech difficulties. Initially, it is the intended purpose of this research project to investigate the minute details of P.G.S.R. audiometry with the hope that a clearer understanding of its advantages and limitations may be reached. In addition, it is hoped that new and more efficient techniques for measurement might evolve from the investigation of other or corollary means of measurement. The recent completion of the new research floors of the Eye and Ear Infirmary has provided quarters which will enhance the carrying out of the research program.

A teaching service

Existing, as it does, in a teaching hospital, the Audiology Service also includes the training of house officers in diagnostic hearing techniques which will enable them to provide competent service for their own hard-of-hearing patients. As techniques are constantly changing, similar opportunities are made available for practising otologists to keep pace with these advances. In addition to the "hospital family" education, a course for industrial and office nurses has been instituted because of the increasing demands for personnel to be trained in the measurement of hearing.

The continually expanding services provided in audiology have necessitated the addition of specialized personnel. Whereas, five years ago the hearing testing was performed primarily by one psychologist not specifically trained in this area, the Audiology Service currently includes two specialists trained in the areas of audiology and speech pathology, and will very shortly have another person with advanced training added to the staff. Such a growth has been possible only through the recognition of the need by such farsighted administrators as Dr. LeRoy A. Schall, Chief of Otolaryngology, and Dr. Philip E. Meltzer, Surgeon in Charge of the Winthrop Foundation.

Alan S. Feldman, Ph.D.,
Director of Audiology

BIOGLETS

Dr. Daniel K. Bloomfield, Resident in Medicine—born in Cleveland, Ohio, December 14, 1926; B.S., U.S. Naval Academy, 1947; Ensign, U.S. Navy, with the 6th Fleet in European waters, 1947-50; M.D., Western Reserve University School of Medicine, 1954; M.S. in Anatomy, Western Reserve University, 1954; Intern and Assistant Resident, Beth Israel Hospital, Boston, Massachusetts, 1954-56.

Dr. Nathan H. Fearer, Intern on the Children's Medical Service—born in Malden, Massachusetts, May 27, 1927; U.S. Army: Sergeant, Panama Canal Zone, 1945-46; B.S., Tufts College, 1951; M.D., Tufts Medical School, 1955; Intern, rotating, Colorado General Hospital, Denver, Colorado, 1955-56.

Dr. Leon I. Goldberg, Intern in Medicine — born in Charleston, South Carolina, September 26, 1926; B.S., 1946, M.S., 1951, Ph.D. (Pharmacology), 1952, Medical College of South Carolina; M.D., Harvard Medical School, 1956.

Dr. William L. Morgan, Jr., Resident in Medicine — born in Honolulu, Hawaii, November 18, 1927; B.A., Yale University, 1948; M.D., Harvard Medical School, 1952; Intern and Assistant Resident in Medicine, Massachusetts General Hospital, 1952-54; U.S. Public Health Service: National Heart Institute, National Institutes of Health, 1954-56; married; home address: Honolulu, Hawaii.

Dr. Egbert Mueller, Assistant Resident in Psychiatry — born in Mannheim, Germany, March 7, 1928; Karl-Friedrich Gymnasium, Mannheim, 1938-47; military service, January 1944-May 1945; M.D., Heidelberg University Medical School, 1953; Intern in Surgery, St. Marien Hospital, Erwitte, Germany, 1954-55; Resident in the Psychosomatic Clinic, Berleburg, Germany, 1955-56.

Dr. Robert K. Osborne, Intern in Medicine — born in Terre Haute, Indiana, June 20, 1930; graduated from Westtown School, Westtown, Pennsylvania, 1948; A.B., Earlham College, Richmond, Indiana, 1952; M.D., Medical College of Virginia, Richmond, Virginia, 1956; home: Bloomingdale, Indiana.

Dr. Jan-Henrik Probst, Assistant Resident on the Children's Medical Service — born in Chojny, Denmark, August 25, 1922; A.B., University of Copenhagen, 1947; M.D., Faculty of Medicine, University of Copenhagen, 1952; Intern, rotating, University Hospital, Copenhagen, 1952; Assistant Resident in Medicine and Pediatrics, Finsen Memorial Hospital and Radium Institute, Copenhagen, 1953; Assistant Resident in Pediatrics, Sundby Hospital, Copenhagen, 1955; Resident in Pediatrics, University Clinic, Kinderspital, Zurich, Switzerland, 1955; home: Copenhagen, Denmark.

Dr. Sanford I. Roth, Intern in Pathology — born in McAlester, Oklahoma, October 14, 1932; Vanderbilt University, Nashville, Tennessee, 1952; M.D., Harvard Medical School, 1956; home: Oak Ridge, Tennessee.

Dr. Thomas J. Whitfield, III, Chief Resident on the Children's Medical Service—born in Portsmouth, Virginia, October 14, 1926; Duke University, 1944-46; M.D., Harvard Medical School, 1950; rotating internship, Philadelphia General Hospital, 1950-51; Lieutenant (jg), U.S. Navy, attached to 3rd Marine Division in Southern California, 1951-53; Research Assistant to Dr. William R.

Waddell, Massachusetts General Hospital, September through December 1953; Intern, Children's Medical Service, Massachusetts General Hospital, 1954; Assistant Resident, Children's Medical Service, Massachusetts General Hospital, 1955; Senior Resident, Pediatric Service, Kaiser Foundation Hospital, Oakland, California, January through June 1955; married; one son.

VOLUNTEER GROUPS

MGH Staff Wives Association

On January 15, in subzero weather, a most delightful morning coffee party was given in Bartlett Hall by the Staff Wives for our visitors from abroad. Mrs. Daniel Ellis, Chairman, reported that it was a most successful occasion, and everybody was very much pleased with the turnout —about 150, despite the weather. Our guests were from North and South America, Europe, and the Orient.

Assisting Mrs. Ellis, as pourers, were Mrs. Chester Jones, Mrs. Walter Bauer, Mrs. Perry Culver, Mrs. Warren Point, Mrs. Fuller Albright, and Mrs. Dana Farnsworth. The hostesses were Mrs. Earle Wilkins, Mrs. Frank Wheelock, Mrs. Alfred Kranes, Mrs. Reed Harwood, and Mrs. Arthur Pier.

Due to an unforeseen conflict of dates, the tea planned for April has been postponed. As soon as a definite date is arranged for the spring tea, it will be announced.

In addition to the group of visiting doctors from other countries, our first Hungarian family, fleeing their homeland and communism, arrived here last December. Their possessions consisted of merely the clothing they wore when they fled. They had nowhere to live. The Staff Wives found them an apartment and provided them with furniture and clothing — all in the same day, practically. It was most gratifying to those at the Reception Center to be able to help them.

Mrs. Claude Welch recently addressed the Women's Auxiliary of the Springfield Hospital, which has a large number of interns from other lands. The Auxiliary is planning new activities similar to those of our Staff Wives, and Mrs. Welch was proud to tell them of the work of our group and of other volunteers at Massachusetts General Hospital.

Our Music Committee has arranged for two concerts in March, to be given in the Chapel at 3 P.M. On Tuesday, March 5, Leonard Moss, a member of the Boston Symphony Orchestra, gave a violin concert, accompanied at the piano by his wife, Frances Moss. On Wednesday, March 20, a program will be given by Gladys de Almeida, soprano, and Mrs. Seth T. Crawford, harpist.

Do you play an instrument or sing? If so, and if you are interested in entertaining patients either formally or informally, please give your name to Mrs. John D. Crawford, President of the Staff Wives Association Music Committee, CLearwater 9-8323, or leave it at the Staff Wives Reception Center at the Hospital.

Distaff Club

Distaff Club members met in February in their local areas. These smaller group meetings appeal to many Distaff-ers who enjoy this more personal type of invitation from their local hostesses.

Future plans of our Club include an afternoon party in March and the annual Spring Dance on May 17. If distant readers of this paper are interested in obtaining tickets for the dance, they are invited to get in touch with Mrs. Charles F. McKhann, at 44A Aldrich Road, Watertown, Massachusetts.

New this year is the Distaff Club newspaper, inspired and edited by Mrs. Thomas J. Whitfield.

New addresses:—

- Dr. Ralph H. Adams (*W.S.* 1935), 31 Stone Ave., Newton. Mass.
- Dr. Clemens E. Benda (a. psychiat.), 111 Pleasant St., Arlington 74, Mass.
- Dr. James H. Currens (a. *M.*), Massachusetts General Hospital, Boston 14. Mass.
- Dr. Lamont W. Gaston (*M.* 1954), Dept. of Endocrinology, University Hospital, Ann Arbor, Mich.
- Dr. Basil B. Jones (*E.M.* 1918 & *C.M.* 1919), 526 North Blvd., Richmond 20, Va.
- Dr. Philip L. McCarthy (a. *D.*), 464 Beacon St., Boston 15, Mass.
- Dr. Nils Normann (a.r.p. *An.* 1951), Dept. of Basic Research, Eastern Pennsylvania Psychiatric Institute, Philadelphia 29, Pa.
- Dr. John D. Pitts (*S.* 1950), 314 Angell St., Providence 6, R. I.
- Dr. Leonard D. Rosenman (*E.S.* 1943), 2320 Sutter St., San Francisco, Calif.
- Capt. Guillermo C. Sanchez, MC, USAR (*M.* 1950), 137th Medical Detachment, APO 59, c/o Postmaster, San Francisco, Calif.
- Dr. Joseph M. Stolman (*Dn.* 1956), D 2912 Benson St., Camden, N. J.
- Dr. Anne G. T. Thomas (a.r.p. *Path.* 1956), Dept. of Pathology, Welch School of Medicine, Cardiff, Wales
- Dr. Alexander B. Timm, Jr. (r.p. *D.* 1956), 36 W. Main St., Milford, Conn.
- Dr. Louis L. Weiss (a.r.p. *An.* 1956), 811 W. 63d St., Indianapolis 20, Ind.
- Dr. Roger E. Wilcox (*S.* 1949), Beckley Memorial Hospital, Beckley, W. Va.

Brief bits:—

Dr. Henry K. Beecher was one of five scientists recently sent to Russia by the American Physiological Society. While there he lectured before the Academy of Sciences at Leningrad and the Academy of Medical Sciences at Moscow. He also delivered two University Lectures at Oxford, England, and one to the Royal Academy of Medicine at Dublin, Ireland.

At the meeting of the American Society for Surgery of the Hand, held in Chicago on January 25-26, Dr. Bradford Cannon spoke on his experiences in the South Pacific and on open grafting of the burned hand. At a meeting of the Cambridge (Mass.) Medical Improvement Society on January 31, Dr Cannon addressed the group on "Tissue and organ homotransplantation".

Dr. Robert R. Linton was a special guest speaker at the Seattle Surgical Society meeting on January 25 and 26, and he also took part in the Washington State Postgraduate Teaching Session held in the same city on January 24. It was a busy three-day period, with formal lectures and participation in panel discussions. The trip also permitted a pleasant reunion with a large group of MGH men who have settled in the Pacific Northwest. These included Dr. Charles MacMahon, Dr. Dean Crystal, Dr. Henry Garrigues, Dr. Robert Coe, Dr. Hugh Lawrence, and Dr. Wade Volwiler. In addition to these, Dr. Richard Kleaveland, from Spokane, Dr. Gordon Jones, from Olympia, and Dr. Toshio Inahara, from Portland, Oregon, joined the group. Dr. Linton added, "The trip also gave me an opportunity to see many old friends of my younger days, since I originally came from this area. It was also pleasing to have one of my former patients, on whom I performed a portacaval shunt at the Mason Clinic in Seattle in 1951, honor me with a cocktail party. Two days of skiing in the deep powder snow in the Cascade Mountains was also a pleasant interlude."

On January 1, Dr. Ernest A. Sneddon took over the responsibilities of the Anesthesia Department of Boston University Medical School (Massachusetts Memorial Hospitals), succeeding Dr. Arrowood.

* * *

Dr. György Acs, his wife Dr. Hedda Acs, and small son András, arrived in Boston from Budapest, by way of Vienna, on December 21. Dr. Acs's letter to Dr. Fritz Lipmann, dated November 27, asking to come to the Biochemical Research Laboratory in this Hospital, elicited prompt response, and the family left Vienna on December 14. They arrived at Camp Kilmer from Munich on the 17th.

Dr. Hedda Acs, now here in Dr. Nathan Talbot's laboratory, was a pediatrician at the Children's Clinic Number 2 of the Medical University of Budapest, which Dr. Dean Clark visited on his recent trip to Hungary. This is a 280-bed hospital, unfortunately situated directly behind the Hungarian military barracks of Kilian. On October 23, the hospital was badly damaged from shrapnel. On that particular day, there were only four doctors in the hospital. The others had been unable to get there due to the fighting which was going on all around the hospital. Dr. Acs herself attempted to get there the next day, and walked the four miles from her home, only to be turned back by the heavy fighting. It was not until five days later that she was able to reach the hospital. By that time all doctors were on 24-hour duty, returning home every alternate 24 hours. The children who could be moved were taken to their homes because of the danger of the situation. Most of the windows of the hospital had been smashed, but had been replaced very rapidly. On November 4, the fighting was resumed at the same location, and once again many of the windows of the hospital were shattered. During this second attack, one ward, the ambulance department, and the top story of the hospital were demolished. Only sixty children had remained in the hospital, and for four days the doctors, nurses, and children were obliged to stay underground. They all slept on mattresses on the floor.

No. 64 in a series of Staff photographs
Dr. Edward P. Richardson, Jr., Assistant Neurologist and Assistant Neuropathologist — Head of Neuropathology Laboratory

Dr. Hedda Acs has given us an account of the educational requirements necessary for the M.D. degree in Hungary, which proved to be very different from those in the United States. After eight years in an elementary school and a four-year high school course, the prospective doctor goes directly to the university for the five-year course in medicine. He then spends three months as an intern in medicine, three months in gynecology, three months in surgery, two months in pediatrics, one month in neurology, one month in ophthalmology, and one month in dermatology. There is an examination after each period and a final examination at the end. Among other subjects, this final examination includes hygiene and forensic medicine. For specialization in the field of pediatrics, it is necessary to spend four years after graduation in a hospital specializing in pediatrics. Ordinarily this would be a children's clinic hospital. Only after the examination at the end of these four years can one be called a pediatrician. The number of years required for specialization in some of the other fields are: psychology and psychiatry, three years; neurology, four years (psychology and neurology together, seven years); surgery, four years; ophthalmology and dermatology, three years; eye, ear, nose, and throat, three years.

In only a few hospitals or clinics is it possible to do research work. For one thing, research equipment is lacking. In addition, there are so many patients per doctor there is no time for research. Ordinarily, there are twenty infants assigned to one doctor in the four-year specialization period. The doctors have many more duties than those in this country, for nurses (who have a three-year training period, as here) are not allowed to give injections, take blood, or perform other such duties. Actually, in the pediatrics service the nurses only feed, bathe, and change the infants.

Dr. György Acs was engaged in enzyme chemistry research in the Biochemical Laboratory of Dr. F. Bruno Straub, at the Budapest Medical University. The research laboratory is government-supported, and is hampered by the unavailability of equipment and supplies. Little or no equipment can be obtained from outside Hungary or the Iron Curtain countries, and research is further curtailed because of the lack of industry in Hungary. It is very difficult to obtain radioactive chemicals, as Russia is their only source of supply. There never seems to be a sufficient quantity, and only four or five types are available at all.

The scientists in the laboratories are almost entirely from Iron Curtain countries. Dr. Acs remarked that it is wonderful to see scientists and doctors from other lands in Massachusetts General Hospital, for there had been no one from the free world in their hospital in Hungary for ten years, and only a few from the immediately surrounding countries.

Dr. György Acs's research work was connected almost entirely with teaching, and apparently this was true of most of his colleagues. He gave five lectures a week (five teaching hours), and was very frequently responsible for the two to three hundred students of Dr. Straub. This obviously cut down on laboratory research time.

Publication of scientific work was almost exclusively in Hungarian and Russian journals, although a few limited publications were allowed in other European countries, particularly after 1954.

The scientific viewpoint in Hungary is largely restricted by the viewpoint of the professor, and if it is in any way contrary to the Russian-held beliefs, the scientist will probably lose his position and standing. For example, the Mendelian theory of heredity has very severe political implications from the Russian point of view. The hereditary principle as expounded by the Russian scientist Lyssenko was the only accepted theory, and if one openly expressed disbelief in the Lyssenko theory, one's position was in jeopardy, prior to 1956.

The Acses are now living in Nahant, where there are a few other Hungarians. They commute to the Hospital with several other MGH doctors. They are very happy to work and study in this country and to be able to live in peace.

⁂

Dr. Robert B. Osgood, an Intern on our West Surgical Service in 1900 and a member of our Orthopedic Staff since 1904, died on October 2, 1956. On November 4, the Medical Advisory Board and the Board of Managers of Alfred I. duPont Institute of the Nemours Foundation, Wilmington, Delaware, passed the following Resolutions on Dr. Osgood:

> WHEREAS Dr. Robert Bayley Osgood, of Boston, Massachusetts, from 1937 to 1946 most ably served the Nemours Foundation and its Alfred I. duPont Institute as a member of the Medical Advisory Board,
>
> WHEREAS due to his guiding influence and wide knowledge of problems of rehabilitation of the crippled child, there was created a great medical institution for the hospitalization and education of the child,
>
> WHEREAS due to his keen interest in research and his belief that no medical institution should exist without a sound program of investigation, such a program was established,
>
> WHEREAS due to his broad vision and delightful and stimulating personality, it was a privilege for the members of the Boards and staff to work with him on the many problems of the Foundation and Institute,
>
> BE IT RESOLVED that we, the Medical Advisory Board and Board of Managers, desire to express to Mrs. Margaret Osgood and her daughter, Mrs. Ellen Osgood Jennings, our deepest appreciation for what Dr. Osgood did for the Foundation and the Institute during this important period in its development and growth.

Signatures of members of the Board of Managers and the Medical Advisory Board are appended, including those of Dr. Joseph S. Barr (*Or.* 1929), Chief of our Orthopedic Surgery Service, and Dr. Philip D. Wilson (*E.S.* 1914), an Honorary Surgeon on our Staff.

THE NEWS

No. 166 Boston, Mass April 1957

RESEARCH IN BURNS 1942 — 1957

Good care of the burned patient demands an enormous amount of continued attention and hard work from doctors, nurses, dietitians, and hospital personnel. So fatiguing and disagreeable can this work be that many of the hospital staff shy away, and the burned patient becomes the orphan child of the surgical service. Since January 1942 the Surgical Research Laboratories of the Massachusetts General Hospital have maintained a continuous program of research in burn therapy, under contract with agencies of the Federal Government. The research has been possible only through the wholehearted collaboration of several services, the nurses, and the administration. Over the fifteen years many individuals have worked on the project. They number so many that it will not be possible to mention all in this brief review of the work. Having been the Responsible Investigator throughout, it falls to my lot to present the review.

Research in burns was not new to the M.G.H. in 1942. Ever since 1821 the Hospital has accepted burn patients, and members of the staff have shown special interest in them. Within present memory, Dr. C. Allen Porter tried homografting in the early 1920's. In 1928 the Hospital cared for the victims of the Beacon Oil explosion in Everett, and advanced studies for the time were made upon them. The impetus for the start of investigation in 1942 was, of course, the Second World War. Experiences of the war in Europe and Pearl Harbor showed that burns were to be a principal injury in modern warfare, and it was at the suggestion of the National Research Council that this Hospital became involved in the research program in burn therapy.

A conference on burns was called by the National Research Council for January 7, 1942 — exactly one month after Pearl Harbor. Dr. Isadore Ravdin of Philadelphia was its organizer and chairman, and he appointed me the secretary. I had had no special experience in burns, and the reason I was invited to the conference, I presumed, was my interest in the adrenal cortex. There were indications at that time that the adrenal cortex was involved in surgical shock and it was believed by some that adrenal cortical extract could diminish the need for fluid therapy in burned patients. In the two years before Pearl Harbor I had been investigating the relation of adrenal cortical function to capillary permeability and the results of the investigations had been published immediately preceding Pearl Harbor.

Being unfamiliar with the recent literature on burns, I spent the ten days preceding the conference reading and thinking about burns. I sketched a memorandum for myself of the direction research in burns should take. It is interesting reading now, fifteen years later, because the thoughts that I had then have actually guided in a large part the course of the research since. I doubted the claims for tannic acid; the fluid therapy needed a formula to anticipate the requirements of the patient and a simple method of measuring the adequacy of the therapy. It occurred to me then that the urine output should logically be such a measurement. The role of the endocrine glands in support of the patient was, of course, a part of my thinking.

The burn patient presents a multifaceted problem, and the investigations at the M.G.H. from the outset attacked the traditional aspects, the wound, the fluid balance, the disordered metabolism, and infection; in addition, they have turned out a new aspect—the psychologic factor which was not envisaged at the outset.

The accepted treatment of the burn wound in 1941 was tannic acid. This treatment required debridement of the dead skin and the spraying of tannic acid over the surface until an eschar had formed. Generally this required twenty-four hours. Silver nitrate had been advocated to hasten the formation of the eschar. Vital dyes had also been offered as an alternative.

In the first place, these methods of producing an eschar were complicated and time consuming for the professional personnel. Secondly, tannic acid had been advocated on the basis that it would not injure viable cells, tanning only the dead tissue; and it was also believed that it would fix toxins *in situ,* holding them from absorption into the circulation. These were unproved assumptions, and on evidence available appeared unreasonable.

The assumptions were put to the test by Dr. Bradford Cannon, who used a simple, ingenious approach in patients who needed grafts. Carefully controlled split-thickness grafts were removed from comparable areas on both sides of the patient and the donor sites treated in various ways. It was soon apparent that the questioning was justified. The wounds were deepened by tannic acid and the dyes. Those treated by the blandest ointments or nothing at all healed most rapidly and with least scarring. These observations provided the principal piece of evidence against the use of tannic acid.

An obvious difficulty with the tannic acid approach was the debridement of the wound needed before the solutions could be sprayed on. Such debridement of extensive wounds required a great deal of professional time and was very painful to the patient, who often required anesthesia. Under conditions of warfare, professional personnel would be in short supply in comparison with the number of casualties, and therefore much needed was a simplified treatment which could be applied rapidly to many patients by a few trained personnel.

The idea of doing nothing to the wound, the simplest of all treatments, immediately came to the fore. But before this could be seriously considered, it was essential to know what would happen to various types of burn wounds if they were left alone. What would happen to a burn bleb if it were left unruptured and merely protected by a dressing? Would it become infected or would healing proceed beneath without interference? A single experience in 1935 convinced me that it was worth a try. I had wrapped up in grease and dry gauze the hand and wrist of a young girl burned by boiling water. This was a highly unorthodox treatment at the time. Hot water, I figured, had probably not destroyed the skin all the way through and, if the surface were kept sterile by the gauze, healing should be excellent. This proved to be the case, although there were uneasy days in the family of the child.

To test the concept that the best should result from doing the least, it was necessary to start with small burn wounds and observe them carefully from every possible angle, including infection and ultimate healing. Thirty-four patients were so treated — a number from the Hospital personnel. A ward maid and a student nurse burned the front of their wrists from opening a sterilizer prematurely. The burns were carefully wrapped in the protective dressing, and from time to time fluid was aspirated from the blebs and cultured. Infection developed in only one of the thirty-four, and this was not serious. Healing generally was rapid and excellent. We then began treating the deeper wounds. After the wounds had been completely covered with petrolatum strips and a generous gauze dressing, a pressure bandage was applied. This so-called pressure dressing was advocated by surgeons of Cincinnati and St. Louis who thought it spared fluid, and it seemed wise at the time to add it. The combined effects appeared so effective that more extensive trial seemed justified. In November 1942 an extensively burned young woman arrived in the Emergency Ward. The house staff (it was an East day) applied the simplified dressing and attended to the fluid needs of the patient. In double-quick time intravenouses were running, the patient was catheterized, and in bed. The simplified therapy of the wound freed the available personnel for the immediate lifesaving measures. This was just one week before the Cocoanut Grove disaster. The East Surgical Service had had a trial run.

The Cocoanut Grove disaster, late in November 1942, was on an East E.W. day. If ever the advantages of forethought and preparation were to be demonstrated it was in the care rendered by the Massachusetts General Hospital to the victims of the Cocoanut Grove disaster. In preparation for civilian bombings, Dr. Edward D. Churchill and Dr. Nathaniel W. Faxon had worked out a plan for disaster management. The principles of triage, of congregating all victims in one area of the Hospital where they could be properly cared for, the setting up of a morgue—these and many other matters had been thought of. Supplies had been collected and the Blood Bank readied by Dr. Soutter for a catastrophe.

On the night of the Cocoanut Grove fire, as soon as it was clear that there had been a disaster and that the Hospital was to anticipate a large number of casualties, the Administration cleared White 6. The patients there were transferred to the available beds elsewhere. After a short survey in the E.W., the victims were immediately taken to White 6 where the resident staff of the East Surgical Service treated the wounds. The house staff members of the other services joined in the care of the patients as indicated. Only a minimal few of the older staff were needed. The organizational plan worked as anticipated.

The burn wounds healed as well as could have been hoped for and, as a result, the Armed Services recommended this approach to wound therapy. It is still in the minds of many as the best treatment for disaster conditions — its great value being that it enables a limited number of medical personnel available to get on with the lifesaving measures.

This simplified treatment did not discriminate between the superficial wound which heals excellently when left alone and the deep wound which subsequently must be grafted. When penicillin became available in 1943, a new program of immediate excision and grafting of the deep wounds was initiated. Penicillin was allotted to the Hospital for this program in the early days when it was otherwise available to only the Armed Forces. It was found that with penicillin the duration of illness could be curtailed and the final healing improved.

The initial care of the wound continues to be a problem, and Dr. Cannon is observing the effect of temperature and humidity upon the rate of wound healing. Both temperature and humidity should influence the growth of cells as well as of bacteria.

In 1947 Wallace, in Edinburgh, described the so-called open treatment of burns — that is, the complete abandonment of all dressings. This approach was so quickly and widely recommended that it appeared wise to evaluate critically the benefit of the so-called pressure dressing. Dr. Anne Wight Phillips and Mr. Douglas Jackson, Surgeon of the Birmingham Burns Unit who visited us in 1954, have examined this experimentally in dogs and have found that the benefit is not statistically significant. The claims made for the dressing in 1941 now appear to have been extravagant.

Regarding the fluid therapy, it was suspected in 1941 that the extensively burned patient needed huge volumes of fluid to survive. It was appreciated that plasma was lost into the burn wound and therefore presumably was indicated in treatment. It was not known how to anticipate the amount or kind of fluid a patient would need. The only formulas available were those which told how much fluid was needed to bring the patient back to normal once dehydration had been established. An early and principal endeavor was to develop a formula to anticipate the needs and not allow the patient to become dehydrated. The so-called surface area formula was the result. Although various modifications have been offered, the basic formula remains.

The concept of the formula originated from simple observation of the swelling of a burn wound. The amount of fluid collecting as edema in the wound appeared to be proportional to the extent or surface area of the burn. Therefore, calculation of the amount of fluid which will be lost in a fresh burn should include the surface area of the burn. It was, of course, necessary to test this hypothesis experimentally. It was also necessary to observe just how rapidly the edema collected, when it reached the maximum, and just how soon it was resorbed. An extensive series of investigations was carried out; starting on animals, the findings were later confirmed by observation of burn patients.

An extensive biochemical and physiological investigation of the burn wound was made to bring logic and order to treatment. The nature of the fluid lost from the blood into the burn wound was carefully quantitated, first in experimental animals and then in patients, by aspirating the fluid from the burn blebs. Drugs such as the sulfonamides were observed to pass in and out of the wounds. Adrenal cortical extract was found not to influence the rate of loss of fluid from the circulation. The posterior pituitary hormones were also ineffective. Simple cold, however, had a startling effect. The immersion of the burned foot of a dog in cold water not only stopped the collection of edema fluid but, also, if a considerable amount had collected before the immersion, some of it was resorbed. Also, pain was relieved. Unfortunately, the cold itself proved damaging if the wound were immersed for too long a time. Many took part in these experiments and in the development of the fluid formula: Drs. John L. Langohr, Cora R. Owen, John R. Graham, George Mixter, Jr., Addison G. Brenizer, Jr., Francis D. Moore, and Leon Rosenfeld.

Dr. Frederic W. Rhinelander carried out a series of experiments on the use of a plaster cast to limit the collection of edema fluid. Measuring blood flow as well as edema pressure, the observations are classic in the pathological physiology of a burn.

It was appreciated in 1941 that burn shock develops rapidly and that the blood pressure often does not fall until just before collapse. The blood hemoglobin concentration and hematocrit, therefore, were the measures at that time of the degree of dehydration. These were abnormal only after dehydration had taken place and were not sensitive enough for the adequacy of the therapy to be judged. It seemed as if the hourly output of urine should be a better measure. As long as the blood volume was within normal limits the blood flow to the kidney should continue and urinary secretion be possible if sufficient fluid were available. The measure of urinary secretion obviously did not depend upon a laboratory and centrifuge; the knowledge gained was immediately available at the bedside. As anticipated, the urinary output soon proved to be a reliable measure of a normal or nearly normal blood volume. By 1943 immediate catheterization of all burned patients, with hourly measurement of urine, was instituted as the standard guide to fluid therapy.

This measurement is not without possible pitfalls. The pain of the burn and the prompt dehydration which is due to the puddling of fluid in the burn wound should call forth a secretion of the antidiuretic hormone of the posterior pituitary. Therefore, during the last three years the urinary guide has been re-examined in the light of hormone suppression in a collaborative study by Drs. George Bascom and Alexander Leaf. Although the posterior pituitary is active, it is not sufficient to dominate and therefore the urinary test still remains as the best bedside guide to the fluid therapy.

Disturbances of intermediary metabolism have been a part of the studies from the beginning. The balances of nitrogen and the common electrolytes were measured on the patients of the Cocoanut Grove disaster. These were made in collaboration with Dr. Ira Nathanson and Hildegarde Wilson, Ph.D., of the Huntington Laboratory. The effect on nitrogen balance previously reported from England and Canada was confirmed, but with greater variation. For the first time, potassium balance was explored and was found not to conform with the nitrogen. This was an enigma which is still not understood. Dr. Wilson discovered that the severely burned patient excretes quantities of creatine in the urine. Dr. Nardi has carried the nitrogen observations further by measuring the pattern of amino acids in blood and urine. There is a rise in the blood and an outpouring in the urine of these acids. This economy of superabundance and apparent wastefulness also does not yet make sense.

The fluid spaces of the burned patient were studied, including that of radioactive sodium. Later, Dr. Moore made the first of his observations on the radioactive potassium and heavy water spaces. The role of the adrenal cortex in determining these spaces was, of course, under scrutiny. Dr. Nardi has observed the dilution of calcium occurring in the blood after severe injury. Most recently, Dr. Benjamin Barnes and Dr. Timothy Harrison have continued work in this field by measuring magnesium.

A fall in the blood serum level of sodium was observed in the first days after severe injury. The level reached is comparable to that of Addison's disease, yet there is every evidence of overactivity of the adrenal cortex. The fall occurs at a time when there is a positive balance of sodium — that is, sodium is accumulating in the body. This has been called the sodium paradox and is thought by some to be the result of the passage of sodium into the cells. Dr. Anne Wight Phillips's most recent observations, in patients who suffered a perforated peptic ulcer, have determined that this fall in sodium is due to a dilution in the extracellular space, not to passage into the cells. The kidney, for an unknown reason, does not hold sodium at the usual level. The meaning is still obscure but it is an indication of the complexity of the reorganization of bodily processes in response to injury.

Many of these changes are believed to be due to an outburst of adrenocortical activity following injury, and Dr. Lewis Engel has been working on this aspect during the last few years. Other metabolic influences, however, must be present. Study of our patients has revealed that the metabolic rate of the burned rises to heights consistent with severe hyperthyroidism. This is the reverse of what would be expected from adrenocortical overactivity. The rise undoubtedly accounts for the rapid body wasting and the need for the greatly increased intake of food. The reason is still obscure. With the collaboration of Dr. John Stanbury and the Thyroid Clinic, the thyroid gland has been found not responsible. A similar short-lived rise has been found to occur in the patients who suffered a perforated peptic ulcer, but it does not ordinarily follow operations or other traumas, such as fractures of the femur.

The study of infection was not a part of the initial program. Dr. Champ Lyons was studying the bacteria of traumatic wounds at the time of Pearl Harbor and it was not until he left for the Army several months later that the Surgical Bacteriology Laboratory was oriented to the problem of burns. Under Drs. Cora Owen and John Langohr infection became a major interest in the burn problem. They were among the first to measure the development of resistance of various bacteria to penicillin. They carried out the first major study of the role of the staphylococcus in the burn wound, and today it is realized that this organism has supplanted all others in significance.

Infection has emerged as the most important unsolved problem of the burned patient. It is now the most frequent cause of death. Before World War II severely burned patients died in the initial hours for lack of adequate fluid therapy. Today it is possible theoretically to carry any patient through the first days. As the wound becomes infected, however, the problem shifts to one of widespread bacterial infestation and sometimes this becomes overwhelming in spite of the chemotherapy available.

Infected wounds of burned patients present a major hazard to a hospital. It has been established by Colebrook in England that bacteria are shaken into the air, particularly when dressings are being changed. We have reason to believe that organisms are blown from one wound to another of the same patient and from patient to patient. The patients are hazards to themselves and to others. It is to be hoped that soon a new operating room with forced filtered air will be constructed—a so-called Colebrook Operating Room. All dressings and operations on burn wounds will be carried out in this room; it should be the cleanest room in the Hospital. Bacterial infestation of the burn wounds should be materially reduced and cross-infection to other patients eliminated. The money needed is available when decision is reached.

Anemia was found to develop rapidly in the burned patient and much time was spent in determining the source. A moderate amount of blood is destroyed by the heat, but a much greater loss comes in the days following injury. Using radioactive iron, Dr. F. D. Moore and Dr. Robley D. Evans of M.I.T. (Consultant in Physics on our staff) found that the blood marrow virtually ceases the new formation of red cells. Although the cause of the anemia is not yet fully determined, it appears to be related to the severe wound infection. Its development is the obvious reason why the burned patient needs so many transfusions over so long a period.

Certainly one of the most fruitful collaborations has been with the Unit of Child Psychiatry, under Dr. Lucie Jessner and Dr. Robert Long. To our amazement, they have been able to show us that many children and some adults unconsciously inflict the burns on themselves and that their subsequent difficult behavior relates to the same problem that led to the injury. They have thus been able to throw considerable light on the grotesque behavior of the burned patient. This study came about in the following manner.

The severely burned patients are notoriously difficult to manage from the professional and nursing point of view. Immediately after they are injured, they are cooperative, calm, and grateful. This pleasant attitude disappears within a few days, and not infrequently after a week a patient has become irritable, complaining, whining, often obscene in language and action, and thoroughly uncooperative. The abnormal pattern continues until convalescence is advanced and then, to our amazement, instead of an ornery, difficult patient, there emerges a well-balanced normal human being.

It occurred to us that this abnormal human behavior might be due to the outburst of adrenocortical activity in response to the injury. The behavior pattern has many features similar to those of the occasional abnormal psychological reaction of the patient injected with ACTH or cortisone. Dr. Jessner had been interested in the psychological reactions of children to operations and had wondered how much of what she was seeing might be due to changes in adrenocortical function. We decided to join forces. Dr. Robert Long was enticed into taking charge of the psychological aspect of the study. Dr. Engel has been carrying out the hormonal aspect. It was decided to start with the burned children because they had uniformly proved to be such psychologic problems.

Of the first twenty-five burn children studied, Dr. Long was able to find that approximately fifty percent had had an unconscious drive to burn themselves. They were getting back at their parents and the injury was in that sense deliberate. In the Hospital some of these children continued the desire for self-inflicted injury and rubbed off their grafts and dressings. Some raised Cain on the children's wards, breaking up the cooperative routine, and were severe behavior problems in general. After gaining this knowledge, Dr. Long pointed out that something of the same picture was being seen in the adults. Two women in particular who had been extensively burned by setting their beds on fire with lighted cigarettes had done so with unconscious intent. This was the method one chose to get back at her husband, and the other to protest her forced removal the next day to a tuberculosis sanitarium. This shed new light on why the alcoholic and others may get burned in bed from lighted cigarettes.

Dr. Long's and Dr. Norman Bernstein's more recent studies have indicated why children and adults who have been caught in true accidents may behave so queerly after entering the hospital. A grown man, used to caring for himself, finds himself helpless and once again totally dependent upon others for eating, moving his bowels, emptying his bladder, perhaps even moving at all in bed. His feeling of helplessness is increased by realization of the danger of his injury. Overwhelmed, he reverts to more childlike patterns of behavior. The tantrums are childhood tantrums. Understanding the reasons for the patients' reactions is already aiding us in management. Scolding only makes matters worse. The better understanding promises to lessen materially the burden of care, and since so much depends upon eating and a reasonable appetite, the psychological outlook of the patient is of the utmost importance.

The cost of the new special equipment needed for the new operating room and the special knowledge required for the care of the burned patient suggest that burned patients in the future will be cared for best in a Burn Center. Several years ago Colebrook realized this, and England has already made headway in the designation of certain hospitals as Burn Centers. This concept has meaning to the Massachusetts General Hospital. Not only would it facilitate the much-needed progress in burn therapy, but it would also supply relief to the personnel caring for these sick patients. Our experience has already shown that caring for them the year round is too much for anybody to stand — doctor, nurse, or dietitian. The year would be divided into three-month periods and four groups of the staff formed — each group taking one three-month turn in the Burn Center. By such sharing, the burned patient would win the enlightened care he is entitled to.

Oliver Cope, M.D.,
Visiting Surgeon

The Board of Trustees, at their meetings on February 6 and 21, voted:

That Fund 4920, General Hospital #6 Fund, be discontinued as a loan fund and that the General Director be authorized to spend the balance in the fund for redecoration of the surgeons' lounge;

To establish an additional assistant residency in Pathology to replace the assistant resident who will be rotating through the Department of Legal Medicine at Harvard Medical School, at no expense to the Hospital.

To reappoint:

Dr. Ira A. Ferguson, Jr. as Second Assistant Resident in Surgery, beginning February 1;

Dr. George D. Zuidema as Third Assistant Resident in Surgery, beginning February 1.

To appoint:

Dr. Fred B. Ballard, Jr. as Assistant Resident in Medicine for one year, beginning July 1;

Dr. John W. D. Garrett as Associate Anesthetist, effective as of March 1;

Dr. Herbert J. Levine as Assistant Resident in Medicine for one year, beginning July 1;

Dr. Charles V. Pryles as Assistant Physician to the Children's Medical Service;

Dr. Paul S. Russell as Assistant in Surgery, effective as of January 1, with the privilege of seeing a limited number of private patients at the Hospital;

Dr. Bruce J. Sams, Jr. as Resident in Medicine for one year, beginning July 1;

Dr. Barbara E. Waud as Assistant Resident in Anesthesia for one year, beginning July 1.

At their meetings on January 2 and during February, the General Executive Committee voted:

That Dr. Martin E. Etchart be given the title of Clinical Fellow in Pathology, for the period April 1 through June 30, in addition to his title of Graduate Student Assistant in Pathology which he now holds;

To extend the appointment of Dr. Jorge L. Litvak as Clinical and Research Fellow in Medicine from February 28 through June 30;

To accept the resignation of Dr. Charles V. Menendez from the position of Clinical Assistant in Surgery, effective April 15.

To change the titles of:

Dr. Robert J. Lifton from Clinical Assistant to that of Clinical and Research Fellow in Psychiatry;

Dr. Claus W. Reichle to that of Clinical and Research Fellow in Anesthesia, as of March 1.

To appoint:

Dr. Anthony M. Dawson as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Dr. Herbert A. Durfee, Jr. as Clinical Assistant in Surgery, assigned to Gynecology, effective as of February 7 through May 7, with the privilege of caring for the private patients of Dr. Meigs in the Baker Memorial and Phillips House;

Dr. Risto Eerola as Fellow in Anesthesia for one year, beginning April 1;

Dr. Stuart Q. Flerlage, Jr. as Clinical and Research Fellow on the Children's Medical Service for one year, beginning January 16;

Dr. Pablo E. Fletcher as Clinical Fellow in Medicine for one year, beginning March 1;

Dr. Hyman Gaylis as Clinical and Research Fellow in Surgery for one year, beginning July 1;

Dr. George W. Hanna as Graduate Student Assistant in Surgery, for the period February 4 through April 3;

Dr. Herbert R. Karp as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. Robert F. Kibler as Clinical Fellow in Neuropathology for one year, beginning July 1;

Dr. Arthur Klein as Clinical and Research Fellow in Medicine, assigned to Allergy, for one year, beginning April 1;

Eric H. Lenneberg, Ph.D. as Research Fellow in Psychology in the Department of Neurology, for the period February 1 through June 30;

Dr. Gian P. Novelli as Fellow in Anesthesia for one year, beginning August 1;

Dr. David C. Poskanzer as Clinical Fellow in Neurology for one year, beginning July 1, to act as Assistant Resident;

Dr. Clorinda J. Scarpa-Smith as Clinical and Research Fellow in Surgery, assigned to Gynecology, for one year, beginning February 13;

Dr. William H. Shafer as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. D. Albert Young as Clinical Fellow in Surgery, assigned to the Tumor Clinic, for one year, beginning July 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Anesthesia.
Scient. Am. 196:70-81.

Cardiology — Pediatric

Darling, R. C., Rothney, W. B., and Craig, J. M.
Total pulmonary venous drainage into the right side of the heart: Report of 17 autopsied cases not associated with other major cardiovascular anomalies.
Lab. Invest. 6:44-64.

General Medicine

Graham, J. R.
Headache.
Dis.-a-month, Jan.:3-47.

General Surgery

Benedict, E. B., and Nardi, G. L.
Peptic stenosis of the esophagus.
Am. J. Surg. 93:238-241.

BIOGLETS

Dr. Robert H. Hansen, Assistant Resident in Anesthesia—born in Hammond, Louisiana, January 31, 1918; B.S., Louisiana State University, 1938; M.D., Louisiana State University Medical School, 1942; Intern, Charity Hospital of Louisiana at New Orleans, 1943; general practice, Baton Rouge, Louisiana, 1943-53; Major, MC, U.S. Army, 1st Division, Stuttgart, Germany, 1953-55; Fellow in Anesthesia, Mayo Foundation, Rochester, Minnesota, 1955-56; married; home: Baton Rouge.

Dr. John A. Mills, Assistant Resident in Medicine—born in Montreal, Canada, June 5, 1929; B.A., McGill University, 1951; M.D., McGill University, 1954; Intern, Montreal General Hospital, 1954-55; Assistant Resident, Department of Pathology, New England Deaconess Hospital, 1955-56.

Dr. Arthur A. Sasahara, Assistant Resident in Medicine—born in Del Rey, California, May 11, 1927; U.S. Army, MC, Sergeant-in-charge, School of Laboratory Technology, Wakeman General Hospital, Camp Atterbury, Indiana, 1945-47; A.B., Oberlin College, Oberlin, Ohio, 1951; M.D., Western Reserve University School of Medicine, 1955; Intern in Medicine, Boston City Hospital, 1955-56; married; one daughter; permanent address: Cleveland, Ohio.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

The Music Committee of the Staff Wives Association arranged for two concerts during April. On the afternoon of the 3d, a string quartette consisting of Lucy Nedzel, first violin, Gloria Kaufman, second violin, Walter Lob, viola, and Joseph Stein, cello, presented a Mozart program. At 3 P.M. on April 17, in the Chapel, a piano recital will be given by Natalie Matovinovic.

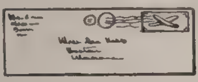
DISTAFF CLUB

Plans are now being completed for the fourth Annual Spring Formal Dance, organized by the Distaff Club and sponsored also by the Massachusetts General Hospital Trustees and General Director, and the MGH Staff Wives Association. Invitations are being mailed, but those living away from Boston who wish to attend the dance may get in touch with Mrs. Charles F. McKhann, 44 Aldrich Road, Watertown, Massachusetts.

The dance committee has engaged the Parker House Roof and Ruby Newman's orchestra for the evening of May 17, beginning at 9 o'clock.

Mrs. A. Erik Gundersen and Mrs. Charles E. Huggins are co-chairmen for the dance. Others on the committee are Mrs. H. Thomas Ballantine, Jr., Mrs. Robert L. Berg, Mrs. John D. Crawford, Mrs. James F. Donovan, Mrs. Daniel S. Ellis, Mrs. Charles S. Keevil, Jr., Mrs. William V. McDermott, Jr., Mrs. George L. Nardi, Mrs. Grant V. Rodkey, Mrs. Edwin W. Salzman, Mrs. J. Gordon Scannell, Mrs. Dagoberto Sosa, and Miss Leslie Stables.

Arrangements are being made for Distaff Club members and their husbands to visit the Museum of Fine Arts here in Boston on an evening in April. It is hoped that a guided tour through a section of the Museum can be arranged.



WE NEED YOUR HELP. Mail sent to several members of the MGH family has been returned to either the Office of The News or the Secretaries' Office, bearing such notations as "Unknown", "Unclaimed", etc. Ever since your editor took over the Directory section of the Annual Report in 1951, she has concentrated on trying to track down all such elusive individuals. If anyone can tell us anything concerning the address of any person listed below, such information sent to Cora F. Holbrook, Archivist and Editor of The News, will be most gratefully received. Here are the names, with last known addresses:

Austin, Grace L. (r.p. *D.* 1930), 25 Albert Ct., Kensington, S.W. 7, London, England
Barnett, Thomas B. (*M.* 1950), Strong Memorial Hospital, Rochester, N.Y.
Beeman, Carl B. (*Path.* 1934), 16 Monroe Ave., N.E., Grand Rapids, Mich.
Bennett, Warren (*M.* 1948), New England Center Hospital, Boston, Mass.
Bloomer, Earl (*E.S.* 1917), 22340 Michigan Ave., Dearborn, Mich.
Bridge, Edward M. (*C.M.* 1927), Johns Hopkins Hospital, Baltimore, Md.
Brindley, Clyde O. (*M.* 1950), Mayo Foundation, Rochester, Minn.
Brown, Ralph G. (*Path.* 1942), 722 Prospect Ave., Winnetka, Ill.
Charash, Leon I. (a.r.p. *C.M.* 1952), 87 Webster, Irvington, N.J.
Colpitts, Grant E. (r.p. *Path.* 1952), Dalhousie Medical School, Halifax, Nova Scotia, Canada
Coolidge, Thomas B. (*W.M.* 1929), Duke University, Durham, N.C.
Cozen, Lewis (*Or.* 1938), 2007 Wilshire Blvd., Los Angeles, Calif.
Edmonds, Henry W. (r.p. *Path.* 1942), 909 University, Seattle, Wash.
Fang, Harry C. H. (a.r.p. *Psychiat.* 1952), Boston City Hospital, Boston, Mass.
Franz, Elmer M. (a.r.s. *Or.* 1948), 85 Grant, Denver, Colo.
Glenn, William W. L. (a.r.s. 1946), 749 Millbrook Lane, Haverford, Pa.
Greene, Daniel C., Jr. (*C.M.* 1940), 263 South Ave., Weston, Mass.
Harting, Donald (*C.M.* 1947), 1625 Northern Pkwy., Baltimore, Md.
Haswell, Howard P. (a.r.p. *An.* 1949), 1403 E. Seneca, Tucson, Ariz.
Hatch, Floyd F. (*E.S.* 1916), 699 E. South Temple, Salt Lake City, Utah
Heath, Robert D. (a.r.s *Or.* 1950), 30 W. Bells Mill Rd., Chestnut Hill, Philadelphia, Pa.
Hills, Henry M, Jr. (*Or.* 1942), 524 Medical Arts Bldg., Charleston, W. Va.
Holt, William L., Jr. (r.p. *N.* 1937), Westboro State Hospital, Westboro, Mass.
Hopkins, Charles E. (a.r.p. *C.M.* 1948), Johns Hopkins Hospital, Baltimore, Md.
Kind, Henry A. (*C.M.* 1935), Tilton General Hospital, Fort Dix, N.J.
Kristjansson, Haukur (a.r. *Or.* 1946), Welch Emergency Hospital, Welch, W. Va.
Lawrence, George H. (*W.S.* 1947), Barnes Hospital, St. Louis, Mo.
Lee, John M. (*C.M.* 1916), 706 Church, Nashville, Tenn.
McCann, Samuel M. (*M.* 1949), Army Medical Service Graduate School, Washington, D.C.
McDowell, William P. (*C.M.* 1917), 142 W. York, Norfolk, Va.
Maisel, Bernard I. (r.p. *Path.* 1943), 103 E. 75th, New York, N. Y.
Makel, Harry P. (c.r.p. *An.* 1949), Fitzsimons General Hospital, Denver, Colo.
Mendelsohn, Mortimer L. (*M.* 1949), Memorial Hospital, New York, N.Y.
Miller, Milton L. (*E.M.* 1932), Veterans Administration Hospital, Brentwood, Los Angeles, Calif.
Ogden, Ralph T. (*C.M.* 1925), 179 Allyn, Hartford, Conn.
Putnam, Charles R. L. (*S.S.* 1895), 333 E. 68th, New York, N.Y.
Rauh, Albert E. (*C.M.* 1936), Lyons, N.Y.
Roth, James d'A. (*M.* 1945), Regional Hospital, SHAAF, Salvia, Kan.
Sabin, Hilbert S. (r.s. *U.* 1941), 1801 K. N.W., Washington, D.C.
Shaw, Henry A. (*W.S.* 1891), 121 E. 31st, New York, N.Y.
Shaw, John L. (r.s. *P.H.* 1935 & *U.* 1937), 899 Madison Ave., Memphis, Tenn.
Smith, Howard W. (*Dn.* 1946), 64 Trumbull, New Haven, Conn.
Stiff, Donald W. S. (r.p. *R.* 1950), Williston, Vt.
Teel, Charles E. (*W.S.* 1925), 1155 State, Bellingham, Wash.
Thompson, Vernon P. (*Or.* 1925), 1136 W. 6th, Los Angeles, Calif.
Ulick, Stanley C. (*C.M.* 1952), Memorial Hospital, New York, N.Y.
Watson, John L. (r.s. *U.* 1930), 4010 N.W. 7th Ave., Miami, Fla.
Weir, David R. (r.p. *Path.* 1938), 2186 Middlefield Rd., Cleveland Heights, Ohio
Wood, Edwin C. (*M.* 1951), Yale University School of Medicine, New Haven, Conn.
Young, Clark (*E.S.* 1923), Medical Arts Bldg., Salt Lake City, Utah

New addresses:—

Dr. Betty Q. Banker (a.r.p. *N.P.* 1954), Boston City Hospital, Boston, Mass.
Dr. Emerson H. Drake (a.r.s. 1945), 18 Branhall St., Portland 3, Maine
Dr. Howard S. English (a.r.p. *N.P.* 1948), 1611 Genesee St., Utica 3, N. Y.
Dr. Bernard M. Jacobson (assoc. p.), Massachusetts General Hospital, Boston 14, Mass.
Dr. David B. Murray (a.r.p. *Path.* 1956), New England Deaconess Hospital, Boston, Mass.
Dr. O. Rhett Talbert (r.p. *N.* 1953), Neurology Dept., Medical College of South Carolina, Charleston, S. C.

Brief bits:—

Dr. Mary A. B. Brazier was an invited speaker at the International Symposium on the Reticular Formation, held at the Henry Ford Hospital in Detroit, March 14-16. On April 6, Dr. Brazier will speak on "The effect of flickering light on human subjects" at a symposium in New Orleans sponsored by the U.S. Army.

Dr. Benjamin Castleman gave a series of lectures and clinico-pathological conferences in Havana, Cuba, during the week of February 18, under the auspices of the Colegio Medico Nacional. During this same period he conducted two microscopic slide seminars for the Sociedad Cubana de Anatomia Patologica, to which he was elected as an honorary member. Dr. and Mrs. Castleman were able to visit with old friends and former MGH Fellows. During their trip they were also able to visit the historic colonial city of Santiago de Cuba which includes San Juan Hill, made famous by Theodore Roosevelt during the Spanish-American War.

Dr. Wyland F. Leadbetter has been elected a member of the American Board of Urology. Dr. Leadbetter lectured at the Dallas Southern Clinical Society in Dallas, Texas, during the period March 17-21. On April 2 he spoke on "Pyelonephritis" before the Boston City Hospital Officers' Association; and during the period April 28 to May 1 he will deliver lectures before the California Medical Association on the subjects "Management of urinary calculi", "Bleeding problems", and "Problems of tissue and organ transplantation".

Dr. Fred A. Simmons has been awarded the Caleb Fiske Prize — the oldest medical essay award in the United States — by the Rhode Island Medical Society for his study of "Present day treatment of infertility".

♣ ♣ ♣

A TRIP TO CENTRAL AMERICA

Mrs. White and I embarked on our recent trip to Honduras and Guatemala for three principal reasons — the invitation of Mr. Claflin, a director of the United Fruit Company, to go with him to the banana plantations along the coast of Central America and visit their experimental laboratories and hospitals; a request from Dr. Fajardo, Dean of the Medical School in Guatemala, to give some neurosurgical lectures; and the chance to follow up 24 patients who have come to me in Boston for neurological examination and surgical treatment. In addition, this offered an unusual opportunity to see some particularly beautiful portions of Central America, its people, and out-of-the-way Mayan ruins.

Mr. and Mrs. Claflin, Mrs. White, and I sailed from Mobile on January 29 on a Honduran freighter that had just dis-

NO. 65 IN A SERIES OF STAFF PHOTOGRAPHS
DR. OLIVER COPE, VISITING SURGEON

charged its cargo of bananas. The two-day voyage across the Gulf of Mexico and down the coast of Yucatan on the *Toltec* was much like traveling on a private yacht. We had the freedom of the ship, and the only other passengers were a priest and an old-time adventurer who had fought in many of the revolutions of Central America.

From Cortes and Tela we visited the plantations, cattle ranches, and jungles along the hot coastal strip. Bananas have three principal ailments. The most difficult to control, Panama disease, results from a fungus that enters the roots and blocks the ducts that carry water up the soft stem, causing the leaves to turn yellow and wilt. This has wiped out entire plantations. Investigators at the research institute in La Lima have given some promise of controlling the disease in areas where the trees are cut down and the land flooded. Water kills the fungus from lack of oxygen after several months, except in the upper few inches of soil. This must then be ploughed under and the land flooded again. Fortunately, it takes only a year or two to replant the trees and have them bear. A second fungus, chicatoga, blackens the edges of the leaves, but is effectively controlled by spraying with copper sulphate. A third important disease is caused by a bacillus and can be spread from tree to tree if all cutting tools are not sterilized.

In addition to plant infections, the different pattern of human disease as seen in the United Fruit Company hospitals in Tela, La Lima, and Quirigua was of great interest. Parasites, tuberculosis, malnutrition, and trauma are the leading conditions that require hospital admission. In the hospital at La Lima there were two Indians with recent gunshot wounds of the spinal cord and another who had had the lower half of his nose cut away with a machete in a drunken brawl. His friends had brought along the amputated tip wrapped up in a banana leaf. As the patient insisted that it be sewn on, this had been done, with considerable misgivings in view of the heat and the time elapsed following amputation. When the dressing was removed for my benefit a week later, a good three-quarters of the grafted tissue appeared to be viable! These hospitals, run by the United Fruit, handle not only the injuries and sicknesses of its employees, but also most of the maternity cases and childhood diseases. In addition to these welfare services, the Company runs schools and a well-known agricultural college near Tegucigalpa, where promising young men are sent from all parts of Central America.

In leaving Honduras we were sent by the Company 200 miles overland across the mountains and forests to Tegucigalpa, with stop-offs to shoot the banana-eating wild muscovy ducks and catch seven-pound bass in the volcanic Lago de Yojoa.

Mrs. White and I then flew to Guatemala, where we were put up by Dr. Rudy Herrera (*E.S.* 1943 & a.r.s. 1946), and feted by many former patients who have made the long trek to Boston, and the families of Drs. Mora and Sosa of the Neurosurgery Service. We were taken out to the ruined Spanish capital of Antigua by a doctor who had a middle fossa meningioma removed six years ago in the Baker Memorial, and then fetched back by a charming young woman who had one resected from the parasagittal region two years later. Dr. Herrera made it possible for me to see many other former patients for follow-up examinations. He has collected an impressive group of men to work with him at the Centro Medico, and has built an unusually well-architected 40-bed hospital on a wooded hillside on the outskirts of Guatemala. At grand rounds they showed a young Indian woman with hindquarter duplication. The extra pair of legs articulated with the right ischium, pointed posteriorly, and reached below the knee of the normal extremities. After aortography, intravenous pyelography, and myelography had shown no serious contraindication, amputation had been carried out without serious difficulty.

The two neurosurgical lectures at the Medical School were at the Spanish hour of 9 to 11 P.M. Then followed the highlights of our trip: a visit to the colourful Quiché Indian city of Chichicastenango on market day, and flying over 400 miles of high mountain and jungle country in a single-engined Cessna plane. The ruins of Tikal, deep in the Mayan jungle and nearly untouched after 1200 years, are more than worth the expense and risk involved in getting there.

This was a never-to-be-forgotten trip, with the opportunity to study one of the biggest farming ventures in the Western Hemisphere, as well as to learn about its problems in plant biology, medicine, and sociology. In addition, we were living with and being entertained over the entire three-week period by a great variety of hospitable people, whose one concern seemed to be that we should become acquainted with the Central American way of life by enjoying their homes, gardens, and ranches. The beautiful scenery, unusual birds, animals, and brilliant flowers were an extraordinary contrast to Boston in midwinter.

James C. White, M.D.,
Chief of Neurosurgery Service

UNIVERSITY HEALTH SERVICES HARVARD UNIVERSITY AND RADCLIFFE COLLEGE

REVIEW AND PROSPECT

The Department of Hygiene at Harvard College had its period of greatest growth from 1935 to 1954, under the leadership of Dr. Arlie V. Bock, then a Physician at the Massachusetts General Hospital and now a member of its Board of Consultation. During Dr. Bock's tenure many improvements in the medical care of Harvard students were effected, and the general pattern of what a health service should be was established. Last year the name of the department was changed to the University Health Services, to signify that it serves not only Harvard College but all the other divisions of the University as well. On July 1, 1957, the newest member of the association of health services joins the central group when the Radcliffe College Health Service becomes a regular member.

More or less parallel with the change in name have come various improvements designed to develop a Harvard-Radcliffe Health Center which will serve the health needs of all members of the University community — not only the students, but the employees and members of the faculty as well. As soon as the new building, soon to be constructed on Mount Auburn Street between Holyoke and Dunster Streets, is ready, all members of the Harvard and Radcliffe communities will be eligible to use the new facilities and professional services. A student insurance plan has been developed and is now in its second year of successful operation. A more extensive plan for faculty and employees will go into action on July 1, 1957. To supplement the present services, the Harvard Corporation has recently approved the establishment of a Division of Environmental Health and Safety and the development of a long-term faculty and employee health survey.

WHAT A UNIVERSITY HEALTH SERVICE DOES

The functions of the University Health Services and a teaching hospital such as the Massachusetts General Hospital form an interesting contrast. The first is organized to care for the health needs of a community that is predominantly healthy. It emphasizes health promotion, the prevention of illness or injury, and the care of comparatively minor medical and surgical conditions. Emotional problems are frequent, but they are of the type that all busy sensitive persons of varying backgrounds are likely to encounter. The emphasis is on the threats to health — early symptoms or warnings that efficient functioning of the organism is threatened. In the other medical organization the emphasis is on the serious disease or injury — how to restore the individual to a state in which he can carry on his usual activities, and the relief of intense suffering. Emotional problems are frequently overshadowed in the physical threat posed by the illness, or in some instances the mental disorder has become so incapacitating that the individual must retire to the controlled environment of the hospital.

The University Health Services are thus designed, not to compete with the Harvard teaching hospitals and the other Boston hospitals, but to supplement their functions, extending the influence of modern health information further and further into the community. At the same time its staff members try to uncover those conditions or threats to health which may be present in the University, and utilize the hospitals for their detection when appropriate. Thus the new building is designed for easy consultation with doctors, group activities, conferences, health inventories, research programs, testing by laboratory and X-ray techniques, emergency diagnosis and treatment, and care of mild illnesses or convalescents. It will not have major operating rooms, nor will it be used for any serious condition that could be more adequately and safely cared for in a general hospital. The insurance programs are supplements to the total plan, making it possible for anyone connected with Harvard to get the best care Boston can offer without seriously endangering his standard of living.

ORGANIZATION

The organization is determined in considerable measure by local and historical conditions, but in general reflects an effort to achieve the advantages of a large unit without at the same time losing the benefits of smaller nearby personal services. The various branches, in addition to the Radcliffe College Health Service on Brattle Street, include the Law School Health Service in Austin Hall, the Business School Health Service in Glass Hall, the Medical Center Health Service in a wing of the Peter Bent Brigham Hospital, and the medical rooms in the Dillon Field House for the medical supervision of athletics and management of injuries. The Harvard Health Center (the new name for the Department of Hygiene building) is located at 15 Holyoke Street, the psychiatry and psychology services are housed temporarily at 78 Mount Auburn Street, and the Stillman Infirmary is still in its faraway location further up on Mount Auburn.

The professional services are divided into four main units. The Medical Service is headed by Dr. Andrew W. Contratto, the Surgical Service by Dr. Augustus Thorndike, the Psychiatry Service by Dr. Gaylord P. Coon, and the Dental Health Service by Dr. James M. Dunning. Stillman Infirmary, with Miss Reta Corbett, R.N., as its Superintendent, serves all parts of the University.

MEDICAL SERVICE

Of the numerous medical problems that confront the Harvard internists, infectious mononucleosis continues to be annoying and frustrating. Beginning with the keeping of detailed records in 1935, there have never been fewer than 20 cases recorded in a single year, 1936-37 and 1937-38 being the two lowest. Since that time there has been a tendency toward increased incidence, with a peak of 77 cases in 1946-47, 70 in 1947-48, a falling off to 40 by 1949-50, and then the highest peak of all in 1955-56, with 89 cases. Whoever develops an effective treatment for this disorder will earn the permanent gratitude of all college physicians.

Infectious hepatitis and virus pneumonia become serious threats to Harvard students intermittently. Hepatitis has been more prevalent since World War II. Tuberculosis is still a threat, and an active case-finding program turns up a few new cases each year.

The number of admissions to Stillman Infirmary each year since 1935 (leaving 1944-45 out of consideration because of war conditions) has varied from a high of 2,128 in 1938-39 to a low of 1,043 in 1955-56. The patient-days for those same years, also the highest and lowest in the series, were 9,560 and 4,330. The tendency toward less illness in college students requiring infirmary care that has been observed at Harvard has also been noted at many other college health services. Evidence as to the reasons for this improvement is lacking. Total clinic visits for all purposes have varied from 47,286 in 1945-46 to 82,413 in 1946-47, with the average during the last eight years being close to 70,000 yearly.

SURGICAL SERVICE

Surgical practice at Harvard tends strongly toward the care of injuries. In the last twenty-two years there have been 7,394 injuries sustained in athletic sports, most of them minor with respect to threats to life but of considerable importance to the individual both from loss of time and complications if treatment is not given promptly and expertly. The most vulnerable portions of the body are knees (1,137 injuries), thighs (911), and ankles (895).

Before participating in body-contact sports each student must have had a physical examination during that year. Strict regulations are enforced when disabilities are found. For example, surgical removal of one of the bilateral organs, extensive surgical scars, absent vision in one eye, or significant cardiovascular, respiratory, or central nervous system lesions would rule out athletic activity in which dangerous accidents are probable from time to time.

About 250 minor surgical operations are performed yearly. All major operations are done in hospitals, usually those in the Harvard teaching group. Appendicitis is common, 38 cases being operated upon in 1955-56. About 21% of all out-patient visits require the services of a surgeon, but 66% of evening and night calls in the emergency clinic are calls for a visiting staff surgeon.

Dental Service

The Dental Service is gradually changing its function from emphasis on restorative dentistry to that of diagnostic screening and dental health education. In the fall of 1955, 1,031 freshmen in Harvard College had bite-wing X-rays as part of their entering health inventory. In this group 754 (73%) were found to have dental defects, and of these 135 required prompt treatment if loss of teeth was to be avoided. All X-ray films were sent to students, with a letter stating whether or not treatment was needed and indicating the degree of urgency.

This service has cramped and inadequate quarters in the present Harvard Health Center, yet the director, his four part-time assistants, the dental hygienist, and the secretarial staff gave excellent service to about 1,300 persons (3,306 visits) last year in addition to their diagnostic examinations. A new activity that is quite worth while is the fitting of athletes who have particularly vulnerable teeth with pliable plastic mouth guards. The proposed new Health Center has adequate office and X-ray facilities, with a five-chair service unit.

Psychiatry Service

The Psychiatry Service has been expanded greatly in recent years. This has not come about because of an increase in the incidence of emotional disorders but rather from a recognition by the University that treatment of students handicapped by conflict and indecision produces favorable results. For each hour of treatment with an individual student the staff psychiatrists probably spend another hour working with parents, teachers, deans, and others who are also concerned with his welfare. Great care is taken to observe the necessary rules regarding the confidential nature of the relationship of a student with his psychiatrist. The student is free to divulge any information or make any statement he chooses to the psychiatrist, knowing it will not be reported to an administrative officer without the student's permission. Since the majority of student problems are of such a nature that collaborative efforts between the Psychiatry Service and the teaching or administrative staff are helpful to students, the desired permission is practically always obtained. Even under these conditions, only such general outlines of the problems under consideration are made known to persons outside the professional staff as will permit effective working together; intimate details are omitted.

Various anxiety states and depressions comprise the most frequent emotional disorders in students. More than 750 different students were seen last year. A considerable number of students obtain help from private psychiatrists in Boston, but the extent of such help is not known. Not until the size of the Psychiatry Service has become stabilized and certain studies now contemplated are completed will a reasonably accurate estimate of the true needs in this field be known.

The service now consists of five full-time and two part-time psychiatrists on the permanent staff, together with three full-time young psychiatrists in a training status. It has been accepted as a regular member of the Massachusetts Psychiatric Training Faculty. Funds for training fellowships now come only from the National Institutes of Mental Health, but additional private sources are being sought.

Associated with the Psychiatry Service are two full-time psychologists — one on the permanent staff, the other in a training capacity. They maintain a very busy schedule, meeting the requests of their psychiatry colleagues for consultations and testings of various kinds.

Research

A major research program is being planned and considerable investigation is already being done by various staff members, particularly by Dr. Charles McArthur, the Chief Psychologist. Adequate quarters for such a program will be developed in the new building. The Grant Study material will be one of the foundation structures in the continuous study of adult development now being projected. Research problems involving infectious mononucleosis, virus pneumonia, better prevention and treatment of athletic injuries, causes of academic failure, detection of students in need of special guidance, and dozens of others await intense study. Cooperative studies with other institutions are very valuable, and a few such possibilities are being explored.

Branch services

In many ways the University Health Services operate as a unit, but, since the University is spread over such a large area, partially separate services can give help more advantageously to many persons who need it than would be the case if all consultations were held in the Health Center itself. The Law School Health Service with Dr. Leo J. Cass as Director, the Medical Center Health Service with Dr. Donald A. Tucker as Director, and the Business School Health Service with Dr. Neil L. Crone as Director operate in various ways as separate services, and the customs and practices differ in these divisions depending upon local plans, needs, and desires. When Radcliffe College joins the group, its director will be a regular member of a council which meets twice monthly to decide matters of general departmental policy. This council is made up of the directors of separate services, the chiefs of professional services, the superintendent of Stillman Infirmary, together with the director of the University Health Services and his executive assistant.

Environmental Health and Safety

The new Division of Environmental Health and Safety will include the present Sanitary Inspection Service and will, in general terms, be responsible for establishing the standards of environmental health and safety desirable for the protection of students, employees, and faculty members while they are engaged in their work at the University. It will also develop a program of health education which will be likely to lead all members of the community to give active support to measures instituted to promote health and prevent illness. The division will be actively concerned with the sanitary condition of food, water, and ice; the disposal of wastes; lighting; ventilation; precautions needed in the handling of toxic materials; prevention of unnecessary injury by explosion or mechanical hazards; safety education; prevention of overexposure to radiation; and protection against loss of time from preventable illness.

In this division a health physicist, or radiological safety officer, will have a very important function. He will cooperate fully with his colleagues with similar duties in the Harvard teaching hospitals.

Appointments in the new division will usually be made jointly with the School of Public Health, thus carrying out one of the general policies of the University Health Services — namely, integrating its activities with those of other departments of the University when such collaboration is desirable.

The maintenance of health and safety standards will be the responsibility of the various departments or projects — members of this division acting only in a fact-finding or consultation capacity. Every effort will be made to be helpful to any research worker and not add to his problems by arbitrary restrictions. The general view that any experiment can be done safely if proper safeguards are set up is the one that will be held by the new division.

Faculty and Employee Health Survey

Routine medical care will not be available to faculty members until present facilities are improved, but in the interval before that is accomplished a survey of the health status of permanent staff members will be started. Each permanent member of the staff will be invited to come in for an annual health inventory, including a physical examination. From the preliminary information gained during this interim period the bases for sound development of a continuous health survey of employees and faculty will be determined. A program of the type envisaged could easily become so complicated that it would fail because of its size. By choosing the routine procedures with great care, and by placing the greatest reliance on the judgment of the examining physician as to what is needed for the protection of the patient, it is hoped to organize a program of preventive medicine and health promotion that will prolong life as well as reduce the costs of illness and injury.

HEALTH INSURANCE

The student insurance plan is devised to give protection to students against the costs of those illnesses which might otherwise result in their being forced to leave college because of lack of funds. They and their parents usually are under heavy financial strain to pay for their regular college expenses, and even a moderate extra outlay for illness is a grave handicap. A single student may insure himself against the cost of illness or injury up to $1,500 for each episode for $14 per academic year or $19 including the summer months. Since his health fee of $42.50 pays for any care which is given him by staff members of the University Health Services, together with unlimited time in Stillman Infirmary, it is very unusual that any illness or injury will result in much additional cost to him. Dependents of students may also be insured at moderate cost. This year more than 99% of Harvard College students are insured, and in the entire University more than 90% are thus protected.

A different plan has been developed for employees and faculty which will become effective July 1, 1957. It is hoped that its provisions will protect those with relatively low incomes by covering nearly the entire cost of such illness as appendicitis, other common operations, and short circumscribed diseases requiring a week or two of hospitalization. It will also serve as insurance against catastrophic illnesses or injuries up to a total of $10,000. About 80% of the entire cost of such major disorders will be paid by the plan, the remainder by the individual. Another feature is that a patient is not required to go to a hospital for treatment in order to obtain help on his medical bills. After a deduction of $25 every three months, medical bills for treatment at home are covered by the plan to the extent of 80% of the total.

This plan is financed in part by the University and in part by individual premiums. An individual will pay $36 and the head of a household $96 yearly for this protection. Although dependents are covered by insurance, they will not be eligible to use the University Health Services for routine medical care. Programs of health education and preventive medicine will affect them from time to time.

HEALTH IS EVERYONE'S BUSINESS

From this very brief description of the total health program at Harvard it can be seen that it is designed to keep Harvard students, employees, and faculty as healthy as possible, to prevent illness, to diagnose and treat diseases and injuries when they occur with as little loss of time and efficiency as is practicable, and when serious disorders do occur to see that patients be given the best care available in the Harvard teaching hospitals or elsewhere. Reinforcing the whole program is a system of insurance coverage which is adequate to prevent serious lowering of living standards due to costs of hospital and medical treatment and yet has enough built-in safeguards to prevent exploitation. Any individual is free at any time to choose whatever physician or group of physicians he wishes to care for him, and likewise he may use the hospital of his choice. At the same time, no one need deny himself medical care at the time he needs it because of lack of funds.

The more effective are the health-building and preventive activities, the less illness and the fewer injuries there will be. The more effective and prompt the treatment of minor symptoms and the more serious illnesses in their early stages, the less should be the demand on the insurance portion of the program. All persons at Harvard, and particularly the physicians, have a vested interest in the maintenance of a high standard of health in the community. The real winner in the program is the individual who pays his share of the cost regularly and gets only good health in return. He will have the satisfaction of knowing that when any one of his associates meets with tragedy in the form of serious illness or injury, his foresight has made that person's financial burden a relatively light one.

Dana L. Farnsworth, M.D.,
Physician
Director of University Health Services,
Harvard University and Radcliffe College

♣ ♣ ♣

The American Academy of Microbiology, Urbana, Illinois, has invited Dr. Louis Dienes and Dr. Fritz Lipmann to become charter Fellows. Notice of this honor has been released by the Executive Secretary of the Academy.

The Academy is to be made up of well-qualified microbiologists in all branches of the science throughout the United States and Canada. Invited charter Fellows are distinguished in the field of microbiology, with wide training and experience.

The purposes of the organization are:

1. To promote the highest professional standing of microbiologists.

2. To carry on professional activities on behalf of the science of microbiology.

3. To promote programs of recognition, certification and accreditation on microbiologists where needed to accomplish the above purposes.

The closing paragraph of the letter from G. I. Wallace, Executive Secretary of the Academy, giving us the above information, reads: "This information is brought to your attention since it is an honor to these persons and to your organization."

Dr. Russell M. Nelson (a.r.s. 1954), a full-time member of the staffs of the University of Utah College of Medicine and Salt Lake County General Hospital, Salt Lake City, was recently selected as Salt Lake City's "outstanding young man of the year" at a banquet sponsored by Salt Lake Junior Chamber of Commerce. He was cited for his work in developing a heart-lung machine.

The Board of Trustees, at their meetings on March 8 and 22, and April 5, voted:

To accept the resignation of Joseph D. Matarazzo, Ph.D. from the position of Associate Psychologist, effective June 30;

To accept with regret the resignation of Dr. George Saslow from the position of Psychiatrist, effective June 30.

To appoint:

Dr. Richard H. Aster as Intern in Medicine for one year, beginning July 1;

Dr. George P. Baker, Jr. as Intern in Medicine for one year, beginning July 1;

Dr. Richard F. Bedell as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Robert Chamberlin as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Roberto A. Cueva as Second Assistant Resident in Surgery, for the period April 1 through June 30;

Dr. Daniel Deykin as Intern in Medicine for one year, beginning July 1;

Dr. Harold T. Dillon, Jr. as Intern in Pathology for one year, beginning July 1;

Dr. Moses J. Folkman as Intern in Surgery for one year, beginning July 1;

Dr. Stanford B. Friedman as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Milton S. Grossman as Intern on the Children's Medical Service for one year, beginning January 1, 1958;

Dr. John B. Herrmann as Intern in Surgery for one year, beginning July 1;

Dr. Albert I. Holtz as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Mark M. Kartchner as Intern in Surgery for one year, beginning July 1;

Dr. William O. Kenan as an Exchange Assistant Resident on the Children's Medical Service, for the period April 1 through May 19;

Dr. Howard S. King as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Robert B. Layzer as Intern in Medicine for one year, beginning July 1;

Dr. John L. Lewis, Jr. as Intern in Surgery for one year, beginning July 1;

Dr. Betty J. McClellan as Intern in Pathology for one year, beginning July 1;

Dr. Arthur J. Moss as Intern in Medicine for one year, beginning July 1;

Dr. Gustave C. E. Mueller as Intern in Surgery for one year, beginning July 1;

Dr. John T. Potts as Intern in Medicine for one year, beginning July 1;

Dr. John P. Remensnyder, Jr. as Intern in Surgery for one year, beginning July 1;

Dr. Dwight R. Robinson as Intern in Medicine for one year, beginning July 1;

Dr. Patrick F. Rose as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Victor J. Rosen, Jr. as Intern in Surgery for one year, beginning July 1;

Dr. R. Neal Schneiderman as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. John W. Singleton as Intern in Medicine for one year, beginning July 1;

Dr. Richard H. Smith as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Donald W. Sutherland as Intern in Medicine for one year, beginning July 1;

Dr. David Van Buskirk as Intern in Medicine for one year, beginning July 1;

Dr. George M. Williams as Intern in Surgery for one year, beginning July 1;

Dr. Carl T. Wolff as Intern in Medicine for one year, beginning July 1;

Dr. Peter M. Yurchak as Intern in Medicine for one year, beginning July 1.

At their meetings on February 13, during March, and on April 3 and 10, the General Executive Committee voted:

To promote:

Dr. W. Hardy Hendren, III, to the position of Resident Surgeon on the East Surgical Service for one year, beginning January 1, 1958.

To reappoint:

Dr. Maxwell G. Potter as Clinical Assistant in Psychiatry for one year, beginning April 15.

To extend the appointments of:

Dr. Karl-Erik Aström as Clinical and Research Fellow in Neurology, for a period of four months, beginning March 1;

Dr. Fernando Rosas-Peña as Research Fellow in Neurology, for a period of three months, beginning April 1;

Dr. Taeko Sumi as Clinical and Research Fellow in Psychiatry, for the period March 1 through September 30.

To appoint:

Dr. Robert L. Bragg as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Robert B. Brendze as Clinical Assistant in Orthopedic Surgery for one year, beginning March 1;

Dr. John J. Calabro as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Ignacio Chavez, Jr. (Rivera) as Clinical Fellow in Medicine, assigned to Cardiology, if and when he obtains a temporary license;

Dr. Peggy J. Clark-Roberts as Clinical Fellow in Anesthesia for one year, beginning August 1;

Dr. Frederick McA. Davies as Clinical Assistant in Surgery, to work with Dr. Daland, for one year, beginning April 1;

Dr. Paul F. Gryska as Clinical Assistant in Surgery, to work with Dr. Linton, for one year, beginning March 15;

Dr. George Kaldor as Research Fellow in Medicine for one year, beginning March 15;

Dr. LeRoy H. Maffly as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Elliott L. Mancall as Clinical and Research Fellow in Neurology for one year, beginning July 1;

Dr. Luz G. Palattao as Clinical Fellow on the Children's Medical Service, for the period of six months, beginning March 1;

Dr. Peter G. Robbins as Clinical Assistant in Surgery, assigned to Gynecology, for the period April 1 through July 31.

The General Executive Committee also voted:

That the appointment of Dr. Hugo W. Moser be advanced, to begin June 16 rather than July 1;

To rescind the appointment of Dr. Myron L. Stein, who was to have reported here as a Clinical and Research Fellow in Psychiatry.

Inasmuch as Dr. Robert J. Lifton has obtained a permanent Massachusetts license, his title will be Clinical Assistant in Psychiatry, effective as of March 14.

* * *

Dr. Edward P. Richardson, Jr. wishes us to report an omission and a correction concerning his article which appeared in the March issue of THE NEWS. Omission: In giving the long list of those who have been associated with the Neuropathology Laboratory in the past, the name of Dr. Lysia Saxe Forno, from Aarhus, Denmark, a Fellow in Neuropathology at M.G.H., 1951-52, now settled in San Francisco, California. Correction: Dr. John O. Strom, Resident in 1944-55, is now in Rochester, N. Y., on the teaching staff in Neurology at the University of Rochester School of Medicine and Dentistry.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Cardiovascular Physiology

Salzman, E. W.
Reflex peripheral venoconstriction induced by carotid occlusion.
Circulation Research 5:149-152.

General Surgery

Bartlett, M. K., and McDermott, W. V., Jr.
Exploration of the pancreatic duct for pancreatitis.
Surg., Gynec. & Obst. 104:377-379.

Cope, O., and Nardi, G. L.
The parathyroid glands.
In Physiologic principles of surgery, L. Zimmerman and R. Levine, Editors, Philadelphia, W. B. Saunders Company, chap. 27.

McDermott, W. V., Jr.
Diversion of urine to the intestines as a factor in ammoniagenic coma.
New England J. Med. 256:460-462.

Neurology, Neurosurgery, and Psychiatry

White, J. C., Sweet, W. H., and Richardson, E. P., Jr.
Cysticercosis cerebri: A diagnostic and therapeutic problem of increasing importance.
New England J. Med. 256:479-486.

Orthopedic Surgery

Cave, E. F.
Treatment of ankle injuries.
G. P. 15:85-93.

Surgery — Reconstructive

Cannon, B., and Murray, J. E.
Transplantation of tissues.
In Physiologic principles of surgery, L. Zimmerman and R. Levine, Editors, Philadelphia, W. B. Saunders Company, chap. 4.

MASSACHUSETTS EYE & EAR INFIRMARY

At a meeting of the Executive Committee, held April 8, it was voted that:

Robert M. Brown, Department of Electrical Engineering, Massachusetts Institute of Technology, be appointed Research Assistant in Otology;

Nelson Yuan-sheng Kiang, Ph.D., Department of Electrical Engineering, Massachusetts Institute of Technology, be appointed Research Assistant in Otology;

Dr. Walter A. Rosenblith, Professor of Acoustical Engineering, Massachusetts Institute of Technology, be appointed Research Associate in Otology;

Dr. Francis L. Weille be appointed Coordinator of Basic Research in the Micro-circulatory Laboratory.

FRACTURE CLINIC

Previous reports to THE NEWS concerning the Fracture Clinic of the Massachusetts General Hospital were made in the February 1948 and May 1955 issues. In these two accounts the history of the Clinic was outlined and its activities were discussed. Since the last report in 1955 the Clinic has actually increased its activities, due largely to the fact that a greater number of accident cases have been received in the Emergency Ward and subsequently admitted to the Fracture Ward. This has come about largely as the result of the willingness of the Hospital to accept any injured person in the west end of the City of Boston who may be brought to the Emergency Ward by ambulance or other means. Two years ago the Hospital adopted a policy whereby no patient would be refused admission, regardless of his financial status. Approximately 25% of all admissions to the Emergency Ward are injured severely, necessitating transfer to the Fracture Ward in the Hospital. The new Emergency Ward policy serves to emphasize the fact that the M.G.H. is exercising its responsibility in the community more and more. This new arrangement has served, also, to keep the Fracture Ward filled and provide an increasing supply of teaching material for both the undergraduate and the postgraduate students. As a result of the increased activity of the Emergency Ward and the Fracture Ward, the Out-Patient Clinic carried a heavier load during the past two years. The OPD Fracture Clinic meets on Tuesday and Friday mornings. Grand Rounds for the Fracture Service have been changed from Friday mornings to Wednesday mornings, from 8 to 10. The yearly end-result Follow-up Clinic is held on Tuesdays at 12 noon. This Clinic includes the private Baker Memorial patients, as well as those patients treated in the Ward. A return of approximately 60% is being maintained. This percentage of follow-up visits is not as good as we would like, but it compares favorably with other clinics that carry out end-result studies of their fracture cases.

Teaching continues to be one of our very important functions, and following World War II the postgraduate course in "The management of fractures and other traumatic conditions" has been given every autumn, under the auspices of the Harvard Medical School, by members of the staff of the Massachusetts General Hospital. Since the inception of the course in 1928 (29 years ago), almost 1,500 students from every State and 10 foreign countries have attended. Panel discussions have replaced to some extent the formerly given didactic lectures. Our system of teaching has been copied almost to the letter by two clinics in other large cities. We accept the compliment. The teaching staff has been altered only slightly since our last report in 1955. The program for the course next autumn will be:

PANEL DISCUSSIONS BY THE STAFF OF THE FRACTURE CLINIC

	Moderators
The hip	Dr. Otto E. Aufranc
Injuries of the hand	Dr. Edward Hamlin, Jr.
Wrist and forearm fractures	Dr. Edwin F. Cave
Femoral shaft fractures	Dr. Edwin F. Cave
Fractures of the knee and leg	Dr. Joseph S. Barr
Fractures of the ankle and foot	Dr. Otto E. Aufranc
Injuries to the spine	Dr. William A. Rogers
The shoulder, humerus, and elbow	Dr. Carter R. Rowe
The patient with multiple injuries	Dr. Charles B. Burbank

LECTURES	*Lecturers*
The healing of fractures	Dr. William A. Rogers
Bone metabolism	Dr. Marian W. Ropes
Abdominal injuries	Dr. Claude E. Welch and Dr. Grant V. Rodkey
Blood vessel injuries and thrombophlebitis	Dr. Robert R. Linton
Burns and blood substitutes	Dr. Oliver Cope
Treatment of shock	Dr. Oliver Cope
Soft tissue plastic procedures associated with fractures	Dr. Bradford Cannon
X-ray, use and misuse in fractures	Dr. Stanley M. Wyman
Operative treatment of fractures	Dr. Edwin F. Cave and Dr. Carter R. Rowe
Head injuries	Dr. William H. Sweet
Epiphyseal injuries	Dr. Robert J. Joplin
Injuries of the knee	Dr. Edwin F. Cave
Open fractures	Dr. Carter R. Rowe and Dr. Lewis W. Kane
Post traumatic pain	Dr. William H. Sweet
Anesthesia for trauma	Dr. Henry K. Beecher
Nerve injuries	Dr. James C. White
Amputations	Dr. Eugene E. Record
Chest injuries	Dr. J. Gordon Scannell
Facial and jaw fractures	Dr. Edgar M. Holmes
Pathological fractures	Dr. Grantley W. Taylor and Dr. Eugene E. Record

Another very major effort of the Fracture Clinic during the past few years has been the writing of a textbook on *Fractures and other injuries.* This text and illustrations are now in the hands of The Year Book Publishers and it will be in print in the late autumn of 1957. The book is a successor to *Fractures and dislocations,* published in 1938 from the Clinic. The new text is not a revision of the previous one, but is an entirely new book on the management of trauma in general. It has been written by members of the MGH Fracture Clinic. Thirty-nine authors have contributed chapters on fractures and other types of trauma, such as abdominal, chest, vascular, neurological, and urological injuries. Drawings have been provided by the Medical Art Department, headed by Mrs. Muriel McLatchie Miller; and the photographic reproductions have been provided by the Department of Photography of the M.G.H., directed by Mr. Donald Withee. Generous donations from grateful patients and from friends of the Fracture Clinic have made possible the publication of this volume. The writing of the text has been a large undertaking. It has required perseverance on the part of all of us. We trust it will be a credit to the M.G.H. and that it will be revised and reprinted in future years to keep pace with the progress of fracture research and management of injuries.

What are some advances in the management of trauma?

(1) Transportation of the injured. More emphasis is being placed upon quick, efficient transportation of the injured, with the simplest and most effective form of splinting. Fractures of the knee and leg are adequately transported in the simple pillow splint. Fractures of the upper extremity are more comfortably immobilized by bandaging the arm to the chest. The patient with a fractured thigh or hip may be moved after the injured member is secured to the opposite leg, which acts as a splint. Except, possibly, for transportation of fractures of the thigh, elaborate forms of traction for transportation are being given up.

(2) Complete evaluation of the injured person is promptly carried out in the Emergency Ward and treatment of shock, if present, is initiated.

(3) Early treatment of the local fracture, by either manipulation or open operation. The more quickly the fracture is reduced and immobilized the easier it is handled and the more quickly will healing begin. Such reduction also prevents swelling and bleb formation, which formerly were contraindications to "reducing" a fracture.

(4) Better training of the fracture surgeon has permitted more accurate selection of the case to be treated by manipulation and the type of fracture which is best managed by open operation. Surgical techniques have been improved.

(5) Metals for stabilizing fractures. 18-8 SMo. stainless steel and vitallium continue to be used routinely in stabilization of fractures by open operation. There is still room for improvement in the design and manufacture of such metals, and in this connection the Joint Committee for the Study of Surgical Materials, organized by Dr. Joseph S. Barr, Chief of our Orthopedic Service, and made up of representatives from the American College of Surgeons, the American Academy of Orthopaedic Surgeons, the American Medical Association, and the American Hospital Association, promises to do much to standardize the manufacture of metals and other surgical materials to be imbedded in the human body. This Committee is backed financially by the above named organizations.

(6) Fractures of the aged. Many cases of fractures of the lower extremities in older patients are more effectively treated by the introduction of metal, as in the case of the hip nail, for fractures of the femoral neck. In the very elderly individual, or when the hip nail has failed, a replacement metal prosthesis may be used in selected cases of the same type of fracture. The medullary nail, driven down the shaft of the femur or tibia, also allows early mobilization with restoration of joint function, muscle control, and a shorter period of hospitalization.

(7) Fractures through diseased bone. Pathological fractures of the long bones are amenable to stabilization by a long steel rod, the "medullary nail". This form of internal fixation does not spread the disease, and by its rigid fixation allows comfort for the patient, early mobilization and ambulation, and an early discharge from the hospital.

The Fracture Clinic is indebted to the Hospital Administration, particularly for providing funds for follow-up studies of fracture patients. Were it not for our yearly end-result study, the teaching of fracture management would fall far below the standards which we have maintained for many years. The Clinic is also grateful to the House Staff, to the Visiting Staff, and, above all, to its patients, who wittingly or not contribute so much to our knowledge and allow us to *progress* in the study and treatment of all forms of injury.

Edwin F. Cave, M.D.,
Head of Fracture Clinic

New addresses:—

Dr. Tucker A. Barth (a.r.s. *Or.* 1957), Medico-Dental Bldg., Stockton, Calif.
Dr. David W. Compton (r.p. *An.* 1946), 905 E. Columbia St., Seattle, Wash.
Dr. Carl F. Essig, Jr. (clin. fel. *N.* 1953), USPHS Hospital, Lexington, Ky.
Dr. Richard W. Garrity (sr. r.s. *N.S.* 1950), 3300 6th Ave., San Diego 3, Calif.
Dr. Falls B. Hershey (*E.S.* 1947), 4960 Audubon St., St. Louis 10, Mo.
Capt. William J. James, MC, USN (r.s. *N.S.* 1949), U.S. Naval Hospital, San Diego, Calif.
Dr. Alexander Marble (r.p. *W.M.* 1930), 15 Joslin Rd., Boston 15, Mass.
Dr. Elliott B. Sweet (a.r.s. *Or.* 1954), 85 Jefferson St., Hartford, Conn.
Dr. Ellsworth H. Trowbridge, Jr. (a.r.p. *N.* 1940), 1440 Professional Bldg., Kansas City 6, Mo.
Dr. Frederick E. Whiskin (r.p. *Psychiat.* 1954), 270 Commonwealth Ave., Boston, Mass.
Dr. Philip D. Wilson (*E.S.* 1914), 535 E. 70th St., New York 21, N. Y.
Dr. Philip D. Wilson, Jr. (*E.S.* 1945), 535 E. 70th St., New York 21, N. Y.
Dr. James B. Wyngaarden (*M.* 1949), Duke Hospital, Durham, N. C.

Brief bits:—

Dr. Henry K. Beecher recently delivered the Hartmann Memorial Lecture at Basel, Switzerland, and the Gross Memorial Lecture at Montreal, Canada.

Dr. Bradford Cannon has recently returned

No. 66 in a series of Staff photographs
Dr. Dana L. Farnsworth, Physician

from a trip to the Marshall Islands, under the auspices of the Brookhaven National Laboratory, to re-examine the group of Marshallese who were exposed to radioactive fall-out in 1954. Among the members of the team was Dr. Edward L. Carter (*S.* 1954), who will return to the M.G.H. this summer.

Dr. Edwin M. Cole presented a paper on "Medical aspects of specific reading disabilities" and participated in a panel discussion in a postgraduate course in ophthalmology and laryngology offered by the School of Medicine of the University of Kansas, at the Medical Center in Kansas City, April 9-12.

Dr. James H. Currens was in Dublin, Ireland, recently, visiting Dr. Timothy Counihan (clin. & res. fel. *M.* 1950). Dr. Currens addressed the Royal Academy of Medicine of Ireland on Cheyne-Stokes breathing. His talk was based upon studies done at the Massachusetts General Hospital in association with Dr. Mandel E. Cohen and Dr Edward P. Richardson, Jr. He also visited the Meath Hospital, which was particularly interesting since both Drs. Cheyne and Stokes were active and teaching in the Meath Hospital 100-140 years ago. Dr. Counihan is well established in Dublin at the Martyr Hospital and is busy teaching and doing investigative work in heart disease at the hospital.

Dr. Arthur W. Allen has recently had a letter from Dr. John W. Smillie (*E.S.* 1944). The summary of the news which applies to him is that he is now Assistant Professor at the Department of Ophthalmic Surgery at the University of Michigan, in Ann Arbor. He was elected to membership in the Michigan Chapter of the Society of Sigma Xi last year, and has recently been elected to the executive committee of the Ann Arbor Figure Skating Club. He and his wife are well. They have three children, ages ranging from 12 to 2.

VOLUNTEER GROUPS

MGH Staff Wives Association

On Wednesday, May 1, in the Chapel, a program of songs was given by Anne Talbot, mezzo-soprano, accompanied at the piano by John Woodworth.

On Wednesday, May 15, at 3 P.M., in the Chapel, Leonard Moss, a violinist in the Boston Symphony Orchestra, will give a concert, accompanied at the piano by Frances Moss.

On Wednesday, May 29, at 3 P.M., in the Chapel, the Boston Intimate Opera group, under the direction of Margo Warner, will perform.

Distaff Club

On April 22, the Distaff Club wives and their husbands gathered at the Museum of Fine Arts for an evening gallery talk on Far Eastern Art. Miss Alice Maginnis, who has conducted tours for us in the past, did a superb job of introducing the group to some of the Museum's most delightful collections.

Over eleven hundred invitations to the Spring Dance were addressed by the hard-working members of the Dance Committee. Distaff and Staff Wives worked together on the plans for this gala evening of dancing on May 17 at the Parker House Roof.

* * *

Mr. Ralph W. Burger, President of the John A. Hartford Foundation, and Dr. Dean A. Clark have jointly announced a gift of $178,009 from the Foundation to the Hospital for the Cardiovascular Research Laboratory.

Dr. Paul D. White, in commenting on the significance of this gift, said, "The unit that is planned is of vital importance to further advances in the research work at the Massachusetts General Hospital, which has always been a leader in medical investigation. This is a research grant for basic work in the most important problems of cardiovascular disease, including especially arteriosclerosis, as well as basic research in fluid and electrolyte balances as they relate to the circulation in health and disease."

Dr. Clark says that this generous gift from the John A. Hartford Foundation will support important investigations in the Cardiovascular Research Laboratory of two problems related to heart and kidney disease. To quote Dr. Clark: "In health, some 60% of the body weight is water present as salt solutions. Disturbances in both distribution and composition of the body fluids occur in association with heart and kidney diseases. In heart failure, as with certain kidney diseases, the patient may suffer from the accumulation of excessive quantities of fluid. In other conditions, the volumes of fluid fall below the normal amounts and result in different disturbances. Many conditions affecting the heart and kidneys cause alterations in the normal composition of the body fluids. As yet, we know very little about the basic mechanisms involved in water and salt movements in the body. Investigations are in progress to determine the mechanisms involved in maintaining the normal distribution and composition of these body constituents. With an understanding of the normal will follow a better understanding of the disease state.

"Coronary heart disease and arteriosclerosis are today the major disturbances affecting the heart and blood vessels. In these diseases there occurs an excessive deposition of a normally occurring fat, cholesterol, in the walls of blood vessels. A study of the production and fate of cholesterol in the body, as well as the factors causing its excessive deposition in the lining of blood vessels, will be undertaken. A rational approach to the prevention and treatment of these diseases should result from such knowledge."

The Hartford Foundation was established by the late John A. Hartford, who was president of the Great Atlantic and Pacific Tea Company for many years.

THE OTHER HEART FAILURE

AN INTERNIST'S PSYCHIATRY

After I had finished my cardiac residency in 1928, Dr. Paul White suggested to me that I might concentrate my clinical studies on hypertension. He blithely added that if I covered hypertension, Dr. Sprague focused on coronary disease, and Drs. Jones and Bland concentrated on rheumatic disease, he himself could be a general practitioner of cardiology. A little later, having just started in private practice and still pondering the concentration on hypertension, Dr. Rackemann saw me unattached at a medical dinner and, willing to give a young man a boost with his betters, kindly asked me to join him and his friend, Dr. George Minot. Dr. Minot wanted to know who I was, where I came from, what I had been doing, and what I intended to do. I made my *curriculum vitae* as brief as my youth and self-interest allowed, and proceeded to my future.

"Dr. Minot," I asked, "at my age, starting in practice, would you advise specializing in cardiology and, more particularly, in hypertension?"

"By all means, Dr. Palmer. Certainly you or any young doctor should concentrate your interest — cover thoroughly even one corner of a medical field for these reasons: First, your patients with hypertension may have any of the other diseases. This will keep you on your toes diagnostically. Second, many of your patients (or their doctors) will be afraid they have the disease you are interested in. Fear is nearly universal, with or without accompanying disease. This never will cease to try your skill as a physician and as a person." Dr. Minot's advice confirmed and strengthened a decision already really made. His prediction that anxiety would be the constant patient problem in medical practice has proved correct.

At first, following and sharing Dr. White's interest in coronary disease, patients were seen and cases reported illustrating the variety of gastric and other symptoms which disguise actual coronary insufficiency and symptoms simulating angina pectoris though associated with duodenal ulcer and other gastrointestinal disorders which are mostly due to anxiety. The reference files and case records over the years are replete with examples of skeletal changes, varicose veins of the upper extremities, intrathoracic nodular goiter, mitral stenosis, esophageal and mediastinal disorders, all responsible for pain quite like angina pectoris due to coronary disease. But the common denominator of most chest consciousness or oppression, breathlessness and palpitation, is fear, discouragement, or lack of heart — the *other heart failure.* (Van Den Berg, J. H.: The phenomenological approach to psychiatry, Springfield, Illinois, Charles C. Thomas, 1955.) This is irrespective of the disease the patient may happen to have, and is about as frequent in patients with no recognizable disease. Actually, the other heart failure is even more distressing when there is no disease to account for it. It seems that conscious tension and anxiety, spontaneous or induced by a thoughtless remark or an over-interpreted electrocardiogram may cause pain in the chest hardly distinguishable from that due to insufficiency of the coronary circulation. It is frequently as disabling, because it is a failure or disorder at the center of the personality. The threat of death, as in angina pectoris, may be more tolerable. Those with the other heart failure suffer from failure in living, and often would settle gladly for sudden death.

Anxiety may seriously provoke, possibly fatally, coronary insufficiency. This places a heavy responsibility on the physician. The doctor, until Semmelweis and Holmes, the unwitting carrier of sepsis, still is the carrier of anxiety. Not only his presence, gestures, manner, word, but even the idea of calling the doctor bears the threat of disability unless he practises rigid psychological asepsis. Diagnosis, usually easy enough, is more important in the harm that the patient's knowledge of it may do. This does not mean the physician should evade the truth, if he is sure of it, but that he should assist the patient to his own truth about his living in view of whatever condition he may have, not anxiety free, for this nearly always is impossible, but at least with no added anxiety. At best, the physician may induce a strength of the other heart, namely courage, which desensitizes the person to inner tension.

Happily, I learned early from two masters of practical psychotherapy — Dr. Arlie Bock of this Hospital and Dr. John Sproule of Haverhill — that angina pectoris and other organic ills may be greatly relieved over many years by proper hygiene, proper choices by the patient, sufficient sedative, and enough of an interested physician's time for psychotherapy. Relief sometimes came spontaneously, sometimes by the patient's insight leading him to limit his desires rather than struggle to satisfy them, often from confidence in his doctor. The feature of improvement was abatement of anxiety or an increasing tolerance of it.

In studying patients with hypertension, I found the blood pressure level a delicate indicator of the other heart strain. Mental arithmetic, anger, fear, and deception long have been known to elevate the blood pressure. This is true in patients with and without hypertension. On seeing a patient for the first time, everything is done to avoid inducing or increasing anxiety. The second principle is to utilize every circumstance of history, physical and laboratory findings, for favorable suggestion. At the first visit and as early in the visit as possible, the examining situation with its threat of unfavorable findings is changed into the psychotherapeutic situation with its favorable suggestions. This is not to minimize the symptoms or to force blanket reassurance, but to throw doubt on the unfavorable significance of symptoms or findings and to emphasize the favorable points. The attitude is: what we do not know is how well the patient may do. As the relationship becomes more secure during the first or later visits, the blood pressure may be taken at intervals in the course of routine interviews, diet checking, medication, rest and activity, coming naturally to details of the patient's life situation. Repeated blood pressure determination as the patient unfolds his life situation is a lie detector of those lies he may tell himself. The difficulty at the office, which a man tries to say is a little thing, is very big. It is nothing less than his prestige status, the matter of others' opinions, giving him his opinion of himself. The "little" strain of the family wanting a new car, of his wife's desire to redo the living room or have a $5,000 modern kitchen may be a tremendous load of financial anxiety. In interviews with 100 hypertensive patients, upward variations in the blood pressure occurred in relation to conscious mental stress, anxiety, and emotion. The mean systolic variation was 30 mm. of mercury, the maximum 82; the mean diastolic variation was 18, the maximum 50. When the posture and cold tests and mental stress tests were superimposed, in some cases the mental stress test gave as high or sometimes higher peaks of blood pressure than the cold test. The relation of blood pressure rises to situational factors, when shown to the patient, demonstrates the evasions and bad faith he may have with himself, begets an inventory of his unfinished psychological business, and opens to him a selection of possible choices which are his, not the doctor's. When things go well, the patient becomes more decisive, is conscious of less strain and fearfulness, and, best of all, feels less dependant upon the doctor and more self-dependant. He is less worried about his future, accepts his past choices if irreversible, but mostly he lives more definitely and more confidently in the present. In short, he lives with more heart.

Assessment of personality and character traits as apparent to the physician-observer and consciously evident to the subject with hypertension appears no different from the pattern generally characteristic of average persons with other diseases or with no disease: practicality, objectivity, and adaptability, without particular originality or special skills other than their job or even special interests — in short, the mediocre predictability required by industry. But this docility, this trained or, from another point of view, enslaved mind, is at the price of conscious tension and anxiety. This is the strain of adaptability or obedience to the dictates of reality testing. It is the pinch of civilization's harness. It is the required uniformity at the expense of individuality. This much admired adjustment for many is "antagonistic cooperation" (Riesman: The lonely crowd, Yale University Press), the "second nature of man's own contriving more hostile than original nature herself."

Like other patients and other people, hypertensives are aware of tension and anxiety. Their particular anxiety, whether focused by us who advise them or by their experience of family and friends, is on the blood pressure and its consequences. Fantasies of disability from stroke or heart failure and of sudden death are common. Behind this is an unquiet conscience due to real or fancied sins, or quite often a feeling that they have not done as well as they should with their lives. Beyond this is an unsettled question of the meaning of their own life and of life in general. Basic to all of these inner experiences is a fear of fate, sometimes frankly of death but usually of disability, of not being able to work. This may be expressed as embarrassed jokes, in equivalents: "I am making repairs on my house only for my wife's second husband"; "I wake early in the morning and wonder when I am going to have another attack". A few frankly recognize and express the lonely terror or dread of the end of living. This anatomy of anxiety is not peculiar to hypertensive patients, is the normal experience of many in their own existence, the all-too-common life of "quiet desperation". Understanding this structure of existence helps many patients to acceptance, decisiveness, and consequent relief of tension and anxieties. Frequently the blood pressure is lower, more often the symptoms are relieved; as one patient said, "The idea of high blood pressure used to poison my life. Now I feel so well I don't care what my blood pressure is!" This patient, advised to have a sympathectomy fifteen years ago which she sensibly refused, now has a normal blood pressure at most of her annual visits, is only slightly restricted as to diet, takes only phenobarbital in small dosage.

The problem of blood pressure anxiety is a special case of anxiety in general in those who chance to have hypertension. The technique of sympathetic non-judging audition is as useful for patients with other complaints as for those with hypertension. Of 100 unselected patients, 80 percent aged 40 to 80, only one-third actually had heart disease or hypertension, but over 50 percent feared one of these diseases or its effects. Cancer was a fear in one-fourth. One-third were afraid of more than one disease, nearly one-fifth of mental disease. It was characteristic that most of these patients felt that something terrible was happening or might happen to them, but were equally aware that they themselves shared in causing their distress — a feeling that they were responsible in part for their troubles. The prevailing self-consciousness was of tension or anxiety (80 percent) in various degrees from mild to acute anxiety attacks, hyperventilation tetany, and acute anticipation of dying. Frequently this persisted in spite of accepted reassurance about heart disease, for instance. An unquiet conscience was apparent in the feeling that they had not made what they should have of themselves, had not got out of life what they might reasonably have expected, sometimes that circumstance had cheated them of their just deserts. About half felt that their lives and life in general were meaningless. Daytime phantasies of escape, just walking quietly away from their responsibilities, were quite common. A little more than 40 percent were aware of a vague dread of the future, some of a frank fear of death or a nameless acute panic at intervals. As one said, "My God, I am afraid of dying, I am even afraid to say it."

Common reactions to these inner experiences were distraction by overwork, multiple meaningless activities and time wasting in or out of the home, purchase of gadgets, spectator sports, and resort to that most reliable of tranquilizers — liquor. It is not unusual to find a family spending up to a thousand dollars per year for this traditional relief from tension, the anesthesia of care known as the cocktail hour, though the new tranquilizing drugs presently are serious competitors in the apathy market.

The wisdom of the body, which the late Dr. Walter B. Cannon studied and spoke about so eloquently, is physiological automation. The steady inward state of the individual vis-à-vis his world is maintained by a marvelous "closed loop feedback". This is nature's automatic calculator complete with circuits (nerves), transistors (ganglia and mid-brain centers), switches (synapses), and recording oscillographs (cerebral cortex). It precisely assays relative degrees of danger and safety, alerts or reassures accordingly, as reported by the only one who knows — the individual self-consciousness. Industrial automation is providing closer and closer parallels of physiology even to chemical switches, very similar to bodily neurotransmitters. These contrivances of the engineers, many of them described by Woodbury in *Let Erma do it* (New York, Harcourt Brace, 1956) allow a fresh diagrammatic look at the complicated physiology and psyche of our patients. The mid-brain is the automatic relay. External input is not only perception or sensation from sight, sound, and touch, but also memory, conscious or unconscious, held by the lag screen oscillograph of the cerebral cortex throughout life. The mid-brain relay transmits appropriate output to muscles and internal organs, all of which feed back internal sensations or impulses to the mid-brain relay while the brain or cerebral cortex records the processes. Most of these recordings are unconscious. When inner and outer affairs go well, there is a general climate of peace; if not so well, of tension or dread; if badly, a violent alerting with terror or panic.

This is how the tranquilizers tranquilize. Liquor, the barbitals, and general anesthesia blur or turn off the images and memories on the oscillograph or closed circuit T.V. screen of the brain and reduce or stop external and internal stimuli. Miltown or Equanil reduce the feedback stimuli from the muscles. Thorazine and its derivatives cut down feedback from hollow organs as Serpasil (snakeroot) does from blood vessels. Thorazine and Serpasil and other similar substances block input and output at the relay circuit in the mid-brain. Blockade of output by blood pressure lowering drugs at sympathetic ganglia, so reducing blood vessel tone and hence feedback, also results in some sedative effect. Tranquilization in this way, aside from the ordinary risks of drugs, reduces alerting and judgment and choice, which are conscious inhibition, substituting for it apathy. To many this seems desirable. I have had hints of hurried and harried doctors resorting to these medicines. An old lady said she preferred encountering a mad dog to consulting a tired doctor. I wonder if she would feel safer with an apathetic one. I ask myself the same question about my lawyer and financial man and think I may ask him the next time I see him whether or not he is on tranquilizers.

The most important theoretical implication, if tranquilizers tranquilize in this way, is the origin of the emotions. The Sherrington-Cannon theory was that bodily changes accompanied — really followed — changes in the mental state. The effect of drugs blocking transmission of input from internal organs and muscles and quieting the emotions favors William James's theory that bodily reactions are primary, i.e., we see the bear, run, and promptly feel frightened. This peripheral origin of the emotions with elaborate interpretations was revived by Kempf more than thirty years ago (Kempf, E. J.: The autonomic functions and the personality, Nervous and Mental Disease Monograph, Series No. 28, New York and Washington, Journal of Nervous and Mental Disease Publishing Co., 1921). The new psychiatric investigation and treatment by drugs supports the conclusion that we think with our body. The brain records what goes on and some of this, and I hold it is the most important part, is conscious — namely, how the person feels. I also hold that the patient's interpretations are as appropriate as anyone's. In actual practice patients are open to suggested interpretations, but experience teaches that such must be in accord with their inward dispositions, are valid as working interpretations only as chosen by the patient. The patient is the final judge.

The so-called phenomenological psychiatry of the internist which I have been describing is this common sense approach. It is simply open uncommitted auditing of the patient's ideas of his life. Depending on the experience, knowledge, and charity of the physician, he may learn to listen to his patient with the "third ear", a phrase which Theodore Reik borrowed from Nietzsche. This is communication without words, but by bodily posture, gesture, facial expression, the immediate situational setting. The Jewish mystic and philosopher Martin Buber describes it in *Between man and man* (Boston, Beacon Press, 1955, also Macmillan). Many generally unknown but successful salesmen who would resent being classed with the mystics have told me of their recognition of a client's unexpressed thoughts and their own seeming ability to share them and even guide them. This use of wordless communication as a sales technique is the precise opposite of the physician's role if he finds he and his patient may communicate other than by words. The psychotherapist has nothing to sell, above all not his own insights into his own problems, which would be as bad as to force the diagnosis of his own physical disease or the drugs which relieve him on all his patients. The physician's role is to invite the patient's attention to the patient's possible choices in accordance with the patient's inward disposition and outward circumstances as apparent to the patient himself.

Few of us or our patients can do without models in examining our bad faith with ourselves and settling our unfinished psychological business. Freud had childhood Maccabean dreams of being a military leader of his oppressed people. Later he once denied his people; even thought of becoming a Protestant to further his career. Nevertheless, he remained a good Jew and, as the Hebrew prophet Daniel did for Nebuchadnezzar, remembered his patients' dreams for them and then interpreted them, probably always identified himself with Moses but could not resist suggesting that he was Egyptian, not Jewish (Jones, Ernest: Freud, life and works, vols. I, II, New York, Basic Books, 1953, 1955). His knowledge, first of himself and then of his patients, has helped or in some way influences most of us. Jean-Paul Sartre is not the much talked of but little studied Left Bank odd-ball of cocktail party conversations. He was a thoroughly trained academic philosopher, then an underground fighter, a prisoner of war writing and producing plays for his fellows. Now he is an influential philosopher and psychologist abroad. He still may be in the stage of being considered absurd here, but just now he and other existentialists are entering the second stage of all new movements, namely, "it has all been said before". It has been said for the hundred years since Kierkegaard and not only by the philosophers. Much of it is the simple experience of countless common men, though there is a two-dollar word for it: the naive ontology of animal faith. Thanks to the suggestion of Dr. John E. Walker, an internist of Columbus, Georgia, who is interested in phenomenological psychiatry, I did some reading *of* Sartre rather than *about* him. Others may be interested in his existential psychoanalyses. Sartre thinks Freud did well to go as far as he did, but that he did not go far enough. The Freudian wish, he thinks, may be reduced still further to an impersonal unsubstantial lack or desire in nature.

Freud's hope was to find the substantial physics and chemistry of desire, the scientific basis of man's fate. Sartre has pursued his introspective labors as a pure psychologist. He establishes desire, value, choice, and individual freedom, but believes them to be completely impossible of fulfillment. There are other views of the abyss of being than those of Freud and Sartre. Old Martin Buber (Friedman: Chicago, Illinois, University of Chicago Press, 1955) by remembering and exploring the mystical experiences of the Galician Hasidic communities of his youth may have reached the limits of his own inner life and, in so doing, assisted countless others to approach the limits of their own. There are those who hold Buber among the wisest of living men. Miguel de Unamuno was a passionately religious man and a fiery political liberal. Called a heretic and revolutionary, he spent much of his 72 years in trouble with political loyalists and rebels as well as with the church of his native Spain. He concluded that to believe in God is to desire His existence; what is more, that though immortality of the soul is illogical, the only way to live on earth is to deserve to live forever. Many honest heretics from scientific, psychologic, and religious dogmas have thought that there may be many ways to so great a mystery as the meaning of their lives.

The phenomenologic approach to our anxious patients is not to propose any one way, least of all our own, but to help them find their ways and, however different from our own, accept other paths as right for them as we do Freud's or Sartre's, Buber's or Unamuno's for them, or any other way for anyone else, as long as they can keep out of jail and have their friends tolerate them.

If we do no more than prescribe tranquilizers, we may as well be horse doctors. If we cannot sympathetically hear from our patients and recognize the fortunately broad limits of irrational inner experience as described by existentialist psychology, we and our patients may do as well by confessing our troubles to the bartenders at the Eden Roc in Miami or the Chez Paree in Chicago and listen to Roberta Sherwood give with "Tears don't care who cries them", and "You're nobody till somebody loves you" — two of her most groovy chants, loaded, I am sure, with existential despair.

Robert S. Palmer, M.D.,
Physician

* * *

Dr. Joseph C. Aub has been elected a member of the National Academy of Sciences in Washington.

Dr. Joseph S. Barr was Visiting Professor of Orthopedic Surgery at the University of California Medical School, San Francisco, from April 29 through May 10, and delivered the Samuel Higby Camp Lecture at the University of California Hospital on May 8. His subject was "Arthroplasty of the hip".

Dr. Barr has been elected Robert Jones Lecturer for 1957 by the Royal College of Surgeons of England. He will deliver the lecture in London in late October.

Dr. Allan M. Butler has been invited, as a distinguished leader in child health, to participate in a California Conference on Child Health at Asilomar, California, held by the Department of Public Health for the State of California, June 13-15.

Dr. Stanley Cobb has been elected an Honorary Member of the Royal Society of Medicine of London.

The Board of Trustees, at their meetings on April 5 and 18, and May 3, voted:

To confirm the appointment of the following to the Advisory Council to the School of Nursing: Miss Sigrid Edge, Miss Alice F. Casey, Mrs. Penelope Hope, and Mrs. Ann Lyons Twomey;
To accept the resignation of Dr. William F. Ketchum as Clinical Associate in Children's Medicine;
To accept with regret the resignation of Dr. Alfred O. Ludwig from the position of Associate Psychiatrist.

To appoint:

Dr. William S. Beck as Assistant Physician, to be in charge of the Baker Laboratory;
Dr. Henry N. Claman as Assistant Resident in Medicine, for the period July 1, 1957 through December 31, 1957, and as Resident in Medicine, for the period January 1, 1958 through December 31, 1958;
Dr. John Q. Durfey as Assistant Resident in Anesthesia, for the period January 15, 1958 through May 31, 1958;
Dr. Francis C. Hersey as Assistant Attending Psychiatrist at McLean Hospital;
Dr. John E. Mazuzan, Jr. as Assistant Resident in Anesthesia, beginning September 1, 1957 instead of December 1, 1956;
Dr. David G. Millard as Second Assistant Resident in Radiology, beginning June 1;
Dr. Leonard H. Plotkin as Clinical Associate in Children's Medicine, beginning July 1;
Dr. Harold Simon as Second Assistant Resident in Radiology, beginning July 1, 1958;
Dr. Frederick E. Whiskin as Clinical Assistant in Psychiatry at McLean Hospital.

At their meetings on April 17 and 24, and May 1 and 8, the General Executive Committee voted:

To recommend to the Trustees the acceptance of the resignation of Dr. G. Douglas Krumbhaar as Associate Obstetrician, effective May 31.

To extend the appointment of:

Dr. Soren Jorgensen as Clinical Fellow in Anesthesia for an additional two months, through May 31.

To reappoint:

Furio D'Abramo, Ph.D. as Research Fellow in Biochemistry, for the period May 1 through August 31;
William S. Quigley, B.S. as Research Fellow in Physics (Medicine) for one year, beginning April 30.

To appoint:

- Dr. Milton S. Grossman as Clinical and Research Fellow on the Children's Medical Service, for the period July 1 through December 31;
- Dr. Henning Pontoppidan as Clinical and Research Fellow in Anesthesia, for a period of eight months, beginning May 3;
- Dr. Jan-Henrik Probst as Clinical and Research Fellow in Children's Medicine for one year, beginning July 1;
- Dr. Robert H. Richie, Jr. as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1;
- Dr. Steven Schenker as Clinical and Research Fellow in Neurology, for a period of six months, beginning January 1, 1958;
- Dr. Dorothy B. Villee as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1;
- Dr. Herman Wing as Clinical Fellow in Physical Medicine for one year, beginning September 1.

SALLY JOHNSON

Miss Sally Johnson, former Principal of the School of Nursing and Superintendent of Nurses for over twenty-five years at the Massachusetts General Hospital, died in the Phillips House on March 24.

Miss Johnson was graduated from the Massachusetts General Hospital School of Nursing in 1910. She came to the School as a trained and experienced teacher from the Connecticut school system. Upon graduation from nursing she taught in the St. Luke's Hospital Training School in New Bedford. From this time on Miss Johnson combined her interest in nursing education with her strong interest and ability in administration. She served as Assistant Superintendent of Nurses at the newly opened Peter Bent Brigham Hospital in Boston, and as Superintendent of Nurses at the Albany Hospital, Albany, N. Y. During World War I she was given leave of absence from the Albany Hospital to serve as Director of the Army School of Nursing at Walter Reed Hospital, Washington, D. C.

Miss Johnson returned to the Massachusetts General Hospital in 1920. A pioneer in both nursing and nursing education, she introduced new methods of administration to improve patient care and to enhance the utilization of nursing time and skills. Because of her foresight, Massachusetts General was among the first teaching hospitals to employ ward helpers, ward secretaries, and practical nurses. She spent 1931-32 at Teachers College, Columbia University, to complete her college study — not that she might hold a degree, but that she might expand her background and thus be able to serve nursing and the Massachusetts General Hospital even more efficiently. Her influence spread far beyond the walls of M.G.H. Over 1,930 young women graduated from the School of Nursing during her administration. Alumnae of the School have worked in every State in the Union and every continent on the globe. Many were prepared to assume leadership in nursing because of her constant efforts to discover and develop all latent possibilities in every student nurse who came under her supervision.

Miss Johnson played an active part in securing sound legislation for nursing in Massachusetts. She was active in local, state, and national nursing organizations, and was a member of the Board of Directors of the National League of Nursing Education, the *American Journal of Nursing*, and the American Nurses' Association. She was an honorary member of the Quota Club, and Chairman of its Committee on Defense.

The students and the alumnae who knew Miss Johnson enjoyed her teaching and respected her counseling. Her neverfailing sense of humor, her insight into an individual's needs and abilities, her uncommon common sense, were always available to help any student nurse who came to her; and many graduates of the School returned to her for advice because they knew they would always receive from Miss Johnson wise guidance, understanding, and encouragement.

[Ruth Sleeper] R. S.

Feby 23 1827

MASSACHUSETTS EYE & EAR INFIRMARY

At a meeting of the Executive Committee, held May 13, the following appointments were made:

- Sidney Futterman, Ph.D.—Biochemist, to work with the Retrolental Fibroplasia Research Study
- Dr. Baruch J. Sachs — Assistant in Ophthalmology
- Dr. John G. Sebestyen — Fellow in Ophthalmology in the Retina Service

---

Dr. George Kelemen has been elected to membership in the American Otological Society.

REFRACTION AND SUBNORMAL VISION CLINIC

The Refraction Department continues to play its various roles in the Massachusetts Eye and Ear Infirmary. Some eight to nine thousand patients are examined for glasses during a year. The personnel is made up of one secretary, two full-time technicians, the house staff, and six visiting staff members. The clinic is in session six mornings and five afternoons per week. The activities of the department are:

1. SERVICES TO THE PATIENT

It is said, "Everyone will eventually have to be refracted." Certainly the need for glasses is felt by many, whether it be for reading, distant vision, relief from headaches or strabismus, or as revealed in a general check-up. Our patients are referred for refraction from the Eye Clinic, where ophthalmoscopy, external examination, and evaluation of symptoms are carried out.

2. TRAINING OF THE RESIDENTS

A considerable portion of the training of our young residents is spent in the refraction department. Our men are usually prepared for this work by taking the Harvard Postgraduate Courses in Optics and Fundamentals of Refraction, where the theory is learned. Then, during their residency they are schooled by actual practice, under the supervision of the staff members assigned to refraction. I am of the opinion that our residents get as much as or more than the personal teaching offered in any other eye training center.

EQUIPMENT

The geography of the refraction room was recently altered. With the approval of the Board of Surgeons and Management, six modern and attractive booths were erected, and so designed that they could, if ever necessary, be utilized for complete ophthalmological examinations. They are somewhat soundproof. The plans were the result of many consultations with office planning staffs of the American Optical Company, the Bausch and Lomb Optical Company, and our own personnel at the Infirmary.

We are equipped with the most modern optical instruments used in the field of refraction. These include two types of lensometers, trial lenses corrected for vertex refraction, spot and streak retinoscopes, and a keratometer. All the booths have projection devices for visual acuity measurements. We also have a considerable variety of testing charts. In fact, the history of refraction can be deduced by a study of the different tests we have. The names associated with many of these charts (i.e., Verhoeff, Lancaster, etc.) are constant reminders of the part this hospital has played in ophthalmological progress. We can also boast of the possession of three refractors and phoropters —instruments which combine the various lenses and many ocular muscle tests in single convenient units. One booth was completely equipped by the Boston Aid to the Blind.

SUBNORMAL VISION DEPARTMENT

This special division is dedicated to helping that group of people who have a small amount of vision, but cannot be helped with the conventional glasses. They are industrially blind, yet can see well enough to get around. They are not totally blind, yet cannot read or see precisely. They are a "forgotten group", in that too frequently they are told they cannot be helped and therefore resign themselves to this fate and either seek no further advice or fall into the hands of charlatans, grasping at any straw, no matter how expensive or futile. It is interesting to note that the number of such patients is on the increase. Three factors probably explain this growth in number:

1. Longer life expectancy, with the greater possibility of developing the associated degenerative retinopathies;

2. Greater incidence of literacy, and long-standing habits of reading of people over 50, as compared with previous generations;

3. Changes in attitude toward vision in older people — i.e., they no longer accept poor vision as an expected feature of getting old. (That is why we see such an increase in number of cataract operations.)

Telescopic lenses, ingenious magnifiers, projection apparatus, and many other gadgets comprise the equipment. Devices such as jewelers' loupes, photoengravers' magnifying lamps, and bird watchers' telescopes indicate the variable and unexpected sources of supply. The clinic was initiated with the financial help of the Boston Aid to the Blind—a dedicated group of women doing outstanding work with the visually handicapped in this area. (At the time of this writing an additional gift for continuance of this work has been received from this same organization.)

This department functions in three major capacities under one heading. It serves the limited-sighted patient:

1. Directly, through testing and providing the aids;

2. Indirectly, by training ophthalmologists to care for this group — thus, extending the service to the local "grass root" level;

3. Indirectly, by acting as a scientific testing and evaluation center for all new aids. We hope thus to eliminate the heartbreaking false hopes which have arisen among many patients in the past through distorted "cure" reports that so frequently appear in the press.

This clinic enjoys close cooperation with all the agencies for the blind, as well as with other centers and hospitals now doing this work. Thus, new discoveries are immediately available to all concerned. We also contribute to dissemination of information regarding these techniques to the national and international scene by regular lectures in the Harvard Postgraduate Courses in Ophthalmology, the Lancaster Postgraduate Courses in Ophthalmology, and Instructional Courses at the Annual Meeting of the American Academy of Ophthalmology.

Albert E. Sloane, M.D.,
Director, Department of Refraction

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

von Felsinger, J. M., Lasagna, L., and Beecher, H. K.
The response of normal men to lysergic acid derivatives (di- and mono-ethyl amides): Correlation of personality and drug reactions.
J. Clin. & Exper. Psychopath. & Quart. Rev. Psychiat. & Neurol. 17:414-428.

Cardiology

Bland, E. F., and Wheeler, E. O.
Severe aortic regurgitation in young people: A long-term perspective with reference to prognosis and prosthesis.
New England J. Med. 256:667-672.

General Surgery

Cope, O.
Thyroid, thymus and parathyroids.
In Surgery, J. G. Allen, H. N. Harkins, C. A. Moyer, and J. E. Rhoads, Editors, Philadelphia, J. B. Lippincott Company, chap. 26.

Nardi, G. L.
Surgical treatment of lye strictures of the esophagus by mediastinal colon transplant without resection.
New England J. Med. 256:777-780.

Randolph, J. G., and Gross, R. E.
Congenital chylothorax.
A.M.A. Arch. Surg. 74:405-419.

Oral Medicine

Trieger, N.
Cat-scratch fever: Case report of nonbacterial regional lymphadenitis.
Oral Surg., Oral Med., & Oral Path. 10: 383-387.

Surgery — Reconstructive

Cannon, B.
Open grafting of raw surfaces.
New England J. Med. 256:672-675.

New addresses:—

Dr. Lewis Cozen (*Or.* 1938), 6010 Wilshire Blvd., Los Angeles 36, Calif.
Dr. Thomas Frank (a.r.p. *C.M.* 1953), 22 Barberry Rd., Lexington, Mass.
Dr. Elmer M. Franz (a.r.s. *Or.* 1948), 1750 Race St., Denver 6, Colo.
Dr. Donald M. Glover (*W.S.* 1922), 10525 Carnegie Ave., Cleveland 6, Ohio
Dr. Robert D. Heath (a.r.s. *Or.* 1950), Lankenau Hospital Medical Bldg., Philadelphia 31, Pa.
Dr. Henry M. Hills, Jr. (*Or.* 1942), 1208 Kanawha Blvd., East, Charleston, W. Va.
Dr. John A. Malcolm (a.r.s.), 41 Ravensworth Rd., Bristol 6, England
Dr. Joseph D. Matarazzo (assoc. psychol. 1957), University of Oregon Medical School, Portland, Oreg.
Dr. Ralph T. Ogden (*C.M.* 1925), 85 Jefferson St., Hartford 14, Conn.
Dr. George Saslow (r.p. *Psychiat.* 1943), Dept. of Psychiatry, University of Oregon Medical School, Portland, Oreg.
Dr. Donald W. S. Stiff (r.p. *R.* 1950), Edward J. Meyer Memorial Hospital, 462 Grider St., Buffalo 15, N. Y.
Dr. Grantley W. Taylor (*W.S.* 1924), Taylor Medical Bldg., 101 River Rd., Weston, Mass.
Dr. Robert J. Tracy (*E.S.* 1943), 153 South St., Pittsfield, Mass.

Brief bits:—

At a meeting of the Geneva Academy of Medicine, held in Geneva, N. Y., on April 22, Dr. Bradford Cannon spoke on "Tissue and organ homotransplantation".

Dr. Edward D. Churchill delivered the Sigma Xi Lecture at the Bowman Gray School of Medicine in Winston-Salem, North Carolina, on April 15. His subject was "Wounds and wound healing". At this time Dr. Churchill was the guest of Dr. Howard H. Bradshaw, who is now professor of Surgery there. Dr. Bradshaw was a Research Fellow in Surgery (Maurice Howe Richardson Fellow) at Massachusetts General Hospital, 1932-33, and Anesthetist, 1933-36. Drs. "Bill" Peete (*S.* 1948) and "Ike" Manly (*E.S.* 1947) dropped in from Durham and Raleigh, respectively.

A most interesting article by Dr. George H. A. Clowes, Jr. (a.r.s. 1948) appeared in the May 4 issue of the *Harvard Alumni Bulletin.* It is titled "New way to the heart", but Dr. Clowes calls it "The development of an artificial heart-lung apparatus to permit surgical repair of defects within the heart". according to a note in the *Bulletin.* Dr. Clowes is Assistant Professor of Surgery at Western Reserve University and is associated with Dr. Fiorindo A. Simeone (*W.S.* 1936), Chief of Surgery at the Cleveland City Hospital. The article carries a picture of Dr. Clowes standing beside his membrane blood oxygenator.

Dr. Roger W. Jeanloz has recently returned from Europe. He delivered a paper at a Ciba Conference on Mucopolysaccharides, and lectured at the University of Geneva, Switzerland, and at the Max Planck Institute for Medical Research, in Heidelberg, Germany.

* * *

Twelve weeks of clinical pastoral training is being offered at Massachusetts General Hospital to twelve seminarians and ordained clergymen from June 3 through August 23, according to the Reverend William B. Spofford, Jr., our Protestant chaplain-supervisor. In the past, two groups of students have been accommodated for six weeks each during the summer months. The change in the program is necessitated for two reasons, says Mr. Spofford. First, the seminaries are now requiring twelve weeks, not six, of clinical training before a student can receive a B.D. degree; and, secondly, research studies indicate that a longer, intensive program is more beneficial to the student and the churches, since under this plan the student can more realistically and adequately discover the nature of human need in illness.

This year's students will come from local parishes, as well as from the Episcopal Theological School of Cambridge, Boston University School of Theology, the General Theological Seminary of New York City, Harvard Divinity School

No. 67 in a series of Staff photographs

Dr. Robert S. Palmer, Physician

of Cambridge, Berkeley Divinity School of New Haven, Connecticut, and the Moravian Seminary of Bethlehem, Pennsylvania. During their stay at Massachusetts General, the students will do some orderly work, serve as chaplain's assistants on selected floors, and attend the classes of a five-course curriculum, in which doctors, social workers, nurses, and all the Hospital disciplines will assist them in evaluating human need and the clergyman's role.

Mr. Spofford says he hopes that such training will not be confined to only the summer months in the future, but that shorter courses and practicums may be developed for the winter months, to meet the needs of parish clergy and older men.

* * *

"Careers that count" was our theme for the observance of National Hospital Week, May 12-18. Invitations were sent to college and high school students to visit the Massachusetts General Hospital on May 15 from 10 A.M. to 4 P.M. The program for the day included: tours of the Hospital; films on careers in the Hospital, shown every hour in the Lower O.P.D. Amphitheatre; and exhibits in the Brick Corridor throughout the week, which included information on the 20 educational programs in which 1,000 students are enrolled at M.G.H.

Members of the Ladies' Visiting Committee, the MGH Staff Wives Association, the Distaff Club, the Board of Managers of the Vincent Memorial Hospital, and the Ladies' Committee of the Bay State Medical Rehabilitation Clinic served on the various committees for the occasion.

* * *

VOLUNTEER GROUPS

Ladies' Visiting Committee

For the past year the Ladies' Visiting Committee has concentrated on special projects which deal directly with the patients, in addition to carrying on with its usual activities.

Assigned visiting on the wards continues as it has for the past 88 years. (This Committee was inaugurated in 1869.) As always, there are a surprising number of patients who enjoy unhurried visits with those who have the time to listen when they wish to talk. As a result, a visitor frequently discovers constructive and worth-while things that may be done for a patient.

In the Baker Memorial waiting room, during the hours when patients are being admitted, members of the Ladies' Visiting Committee greet these people and visit with them, when appropriate. There are questions to be answered, and a variety of thoughtfulnesses that can be shown them and their anxious families. Coffee is served to them, and frequently there are follow-up visits while they are hospitalized.

A traveling store cart from our General Store is conveyed periodically throughout the Hospital and into the wards. The emphasis in rendering this service is placed on friendly visiting with the patients and not primarily on selling for the Store.

The Chapel Committee takes complete responsibility for our lovely Chapel. This includes arranging and caring for the flowers on the altar, as well as the general supervising of this vital spot.

The Christmas Committee takes great pleasure in carrying out various assignments which cover so many of the activities during this holiday season. These include parties on all the wards and in the corridors, the mailing of the Christmas season programs, and the arrangements for holiday decorations throughout the Hospital — to mention but a few.

A new project this year has been the building up of the library of children's books in the Burnham. This idea was instigated and carried out primarily by one member of our Committee, who is to be congratulated on the success of this venture.

It was a great pleasure to have the Staff Wives meet with us recently in Bartlett Hall for a morning coffee party and a showing of the MGH polio film. There are several groups of volunteers working in the Hospital, and it is very helpful for all of us to meet each other. We hope that gatherings such as the above may be held more frequently in the future.

The Ladies' Visiting Committee is uniquely fortunate in that we are not a money-raising group. The profits from the General Store in the Moseley Building provide a fairly substantial amount of income, which, with the income from several funds left by or given in memory of past members, is sufficient to cover the undertakings of the Committee.

In the above we have touched on only a few of our many activities. If any department or service in the Hospital knows of any other assistance the Ladies' Visiting Committee might be able to render, we would be glad to receive such suggestions, for it is our sincere desire to help the Hospital in any way we can, within the limits of our resources.

V. B. A.,
Publicity Representative,
Ladies' Visiting Committee

ATHEROSCLEROSIS, ATARAXIA, AND THE MILLENNIUM

"Wee, sleeket, cowrin', tim'rous beastie,
O, what a panic's in thy breastie!"

When Burns wrote this "To a mouse" I am sure he never thought it might be applied to a critique of Western Civilization, nor did he know that the mouse, as a rodent, belonged to an order least likely to develop spontaneous atherosclerosis. At least the rat is an animal difficult to debauch into vascular disease, even though the rabbit, another rodent, may acquire atheroma if fed heavy doses of cholesterol to which he is unaccustomed. Malinow told me in Buenos Aires that a rat would rather starve to death than eat propyl thiouracil in his diet which might result in atherosclerosis by compromising his thyroid activity.

When I was a medical student, Richard Cabot used to tell us that, whenever anyone in his family was taken ill, he (or the sick member) could always remember something he had eaten which was undoubtedly responsible for his disease.

Later on, with Minot's discovery of the virtues of liver in pernicious anemia, and vitamins and trace elements in some other diseases, our thinking changed from blaming an illness on what the patient had eaten, to accusing him of *not* eating some beneficent substance.

In the history of research on atherosclerosis a rather similar course has been pursued. Long ago, the rabbit, later the chicken, the dog, the rat, and the monkey obligingly deposited cholesterol material in their arteries following the consumption of diets high in cholesterol — at times, however, only when combined with other appropriate procedures.

Next, and most compelling at the moment, came information from round the world that diets high in animal fat were dangerous, and what was demanded was less of these foods which every good cook knows make the tastiest dishes.

In turn, however, it began to look as if the "hardened" fats, those containing less unsaturated fatty acids, were the culprits. And this would include the hydrogenated vegetable fats or margarines. If cholesterol ideally esterifies with linoleic, rather than oleic acid, let us by all means eat plenty of linoleic and other polyethenoid fatty acids.

So that from an aversion to eating the fat on a lamb chop, and what our British friends call "beef drippings", we are now commanded to eat every day our preventive ration of corn oil, soy bean oil, soy flour, soy lecithin, whole grain cereal, peanuts, walnuts, peas, beans, and sunflower seeds.

But I really have wandered away from my text, bemused by the odors of Chinese cooking, and the lovely polyethenoid oils of the safflower and the sesame.

The point I was after in my original quotation was that the mouse was in a panic, or had a panic in him, because, rising insidiously above the more mundane facts about diet, obesity, and lack of physical exercise are the psychosomatic miasmata hinting that, after all, atherosclerosis and coronary artery disease are manifestations of emotional stress.

Now, as has been noted by others, "stress" has become a naughty word. At all costs, and they are considerable, it must be supplanted by ataraxia — "calmness untroubled by mental or emotional excitation; imperturbability". (Webster)

In the article by Dickel and Dixon (J.A.M.A. Feb. 9, 1957) on the dangers of tranquilizing drugs, the present day is described as "the age of anxiety", when mankind has suddenly discovered that "elements of tension exist in and are common to each race and geographical sector of the world" and our improved methods of communication permit us to learn about everybody's woes very rapidly. They state that some statistics show that anxiety affects 25-50 million people in the United States, which seems to me to put it in the class with halitosis and athlete's foot, with about the same mortality implications.

Anxiety and stress are hard to titrate, and have no meaning except in relation to the individual, and as Miles says "no one yet has demonstrated in humans that stress of a magnitude compatible with a 'normal life' can influence the deposition of cholesterol material in coronary vessel walls." Yet State Legislatures have decreed, as in Massachusetts, that, regardless of the evidence, it shall be presumed that heart disease or hypertension results from certain civic employment of a supposedly stressful nature.

I suggest that it might be admitted that suicide is often a manifestation of emotional strain, yet the incidences of coronary disease and suicide do not correspond in different countries. Japan, for example, has a high suicide rate, manifest hypertension, but a low rate of coronary disease.

It is an easy conversion from fancy to fact to attribute the rising rate of coronary occlusion to the promptings of conscience, ambition, hard work, and apprehension, and to believe that these fundamental human drives are peculiar to the present day. History tends to belie this, and a hundred years ago Thoreau wrote "the mass of men lead lives of quiet desperation."

Rage and frustration raise the blood pressures of certain people and perhaps the emotions may be implicated in some of the hypertensive problems of civilized countries, but this is by no means clear, and overweight correlates better with high blood pressure than does unhappiness. Significant also, in answer to our assumed increase in anxiety in the past ten years, is the fall of 18 percent in the death rate, in the United States, from hypertension with heart disease, between 1952 and 1955. Perhaps the 30 billion tablets of one tranquilizing drug sold to the American public from January to October 1956 show a therapeutic trend, but it seems unlikely that these drugs have been used extensively for a long enough time to show such an effect on the death rate from a chronic disease.

But back to our panicky mouse. Fox, from data collected from 10,000 autopsies at the Philadelphia Zoological Society, found no wild rodent to have arterial disease. "Animals that prance, jump, run, and climb the most are least affected, while those which are rather quiet exhibit the highest incidence of lesions. Those that best illustrate the most pronounced forms of arteriosclerosis — bovines, parrots, and ducks — are relatively placid animals."

With the exception of insects, the rodents, and especially the rats, mice, and (on Boston Common) the squirrels, present the greatest survival menace relative to man. These creatures are alert and active, they eat everything and they probably have that degree of anxiety which gives them their competitive ability. They are not victims of ataraxia nor of the welfare state which, in spite of its supposed security, has been held responsible for the striking rise in the suicide rate of Britain, and the growing problem of juvenile delinquency in Sweden.

The millennium, if we can recognize it when it arrives, will be neither atherosclerotic, nor ataractic, but I hope will be full of energy and a lot of fun.

Stress, to my mind, does have something to do with coronary atherosclerosis, but only by virtue of making the American male allocate less time for daily exercise and by forcing him to compulsive eating, drinking, and smoking as a defense against his frustrations.

But emotional tension and anxiety have some therapeutic virtues, and certainly are essential to any existence of significance. It is absurd to go through life worrying lest you get into some situation of anxiety, and taking pills to depress your reaction to stress.

The Boston Globe recently published an article on the success of tranquilizing drugs in mental disease. A woman was described who was paranoid and had auditory hallucinations, and who became calm and relaxed with this therapy. She was asked if she still heard voices and she replied: "Oh yes, the Devil still hollers at me, but I don't bother to holler back."

See what I mean? "The Devil", as my friend Dr. Hans-Lukas Teuber said to me when I told him this story, "was invented to be hollered back at." Physical and emotional responses to stimuli should remain vibrant. It will be the relentless decline into inertia that will degenerate our vascular systems and not the labor of our hands or minds or the protestations of our souls.

Howard B. Sprague, M.D.,
Member of the Board of Consultation

* * *

Dr. Henry K. Beecher is President-elect of the Association of University Anesthetists.

Dr. Bradford Cannon was elected President of the American Association of Plastic Surgeons at a recent meeting of the Association, held at Skytop, Pennsylvania.

Seven of the eight men who started their surgical training at the Massachusetts General Hospital on July 1 received their M.D. degrees from Harvard Medical School on June 13. Four of these degrees were *cum laude* and one *magna cum laude*. The group includes the winner of the Harvard Medical Alumni Association Prize, and the winner of the Boylston Prize and the Borden Undergraduate Research Award in Medicine.

The Board of Trustees, at their meetings on March 22 (report delayed in reaching THE NEWS office), during May and June, and on July 26, voted:

- To accept the resignation of Dr. Otto E. Aufranc from the Social Service Advisory Committee and to appoint Dr. William N. Jones to replace him;
- To accept with regret the resignation of Dr. Frederic M. Blodgett from the position of Physician to the Children's Medical Service;
- To accept with regret the resignation of John D. Gregory, Ph.D. from the position of Associate Biochemist, effective June 30;
- To accept the resignation of Dr. Gerald A. Kerrigan from the position of Assistant Physician to the Children's Medical Service;
- To accept with regret the resignation of Dr. John D. Leidholt from the position of Assistant in Orthopedic Surgery.

To change the title of:

- Dr. Edwin F. Cave to Consulting Visiting Orthopedic Surgeon, as of July 1.

To extend the appointment of:

- Dr. William P. Chapman as Assistant in Medicine, from July 1 through November 30.

To appoint:

- Dr. Irving P. Ackerman as Assistant in Medicine, beginning January 1, 1958;
- Dr. John S. Barlow as Assistant in Neurology for one year, beginning July 1;
- Dr. John C. Dalton as Assistant in Medicine, beginning July 1;
- Dr. Stanley H. Eldred as Associate Psychiatrist for one year, beginning September 1;
- Dr. Hugh D. Hall as Intern on the Dental Service for one year, beginning July 1;
- Dr. Timothy S. Harrison as Second Assistant Resident in Surgery, beginning July 1;
- Dr. Chester M. Jones as Acting Chief of the Medical Services during the absence of Dr. Bauer because of illness;
- Dr. Thomas J. Keenan as Assistant Resident on the Anesthesia Service for one year, beginning September 1;
- Dr. Edmund Klein as Assistant Resident in Dermatology for one year, beginning July 1;
- Dr. John B. Little as Second Assistant Resident in Radiology, beginning October 1, 1958;
- Dr. Robert B. McFarland as Third Assistant Resident in Pathology for one year, beginning July 1;
- Dr. J. Malcolm McNeill as Assistant in Radiology, beginning July 1;
- Dr. Donald P. Pederson as Assistant Anesthetist, effective April 1;
- Dr. Majic S. Potsaid as Assistant in Radiology, beginning July 1;
- Dr. Harrison L. Rogers, Jr. as Second Assistant Resident in Surgery, for one month, beginning July 1;
- Dr. Earle H. Rosenberg as Intern on the Dental Service for one year, beginning July 1;
- Dr. Guillermo C. Sanchez as Assistant in Medicine, beginning October 1;
- Dr. Stefan C. Schatzki as Acting Resident in the Department of Radiology, beginning July 1;
- Dr. Robert A. Schmidt as Assistant Resident in Anesthesia, beginning July 1;
- Dr. William L. Strickler as Third Assistant Resident in Surgery, beginning July 1;
- Dr. Clarence E. Thornton as Assistant Resident in Psychiatry for one year, beginning July 1;
- Dr. Giles D. Toll as Assistant Resident in Pathology for one year, beginning July 1;
- Dr. Alexander T. M. Wilson as Visiting Psychiatrist pro tempore, beginning May 27.

At their meetings on May 15 and 22, during June, and on July 2 and 10, the General Executive Committee voted:

To change the title of:

- Dr. Thomas J. Whitfield, III, from Chief Resident on the Children's Medical Service to Clinical Assistant and Acting Resident on the Children's Medical Service, for the period July 1 through December 31.

To promote, as of July 1:

- Dr. W. Gerald Austen to the position of Second Assistant Resident in Surgery;
- Dr. Alexander Breslow to the position of Second Assistant Resident in Pathology for one year;
- Dr. Bob Bullwinkel to the position of Third Assistant Resident in Surgery;
- Dr. Edwin L. Carter to the position of Second Assistant Resident in Surgery;
- Dr. John D. Constable to the position of First Assistant Resident in Surgery;
- Dr. Harry B. Ditmore, Jr. to the position of First Assistant Resident in Surgery;
- Dr. Louis H. Edmunds, Jr. to the position of Third Assistant Resident in Surgery;
- Dr. Robert P. Fornshell to the position of Senior Resident in Orthopedic Surgery;
- Dr. Donald J. Glotzer to the position of First Assistant Resident in Surgery;
- Dr. Jack J. Greenberg to the position of Third Assistant Resident in Surgery;
- Dr. John W. Grover to the position of Third Assistant Resident in Surgery;
- Dr. Robert S. Harper to the position of Second Assistant Resident in Pathology for one year;
- Dr. Stephen E. Hedberg to the position of Second Assistant Resident in Surgery;
- Dr. Charles E. Huggins to the position of First Assistant Resident in Surgery;
- Dr. Richard T. N. Hunt to the position of Third Assistant Resident in Pathology for one year;
- Dr. Dale G. Johnson to the position of Third Assistant Resident in Surgery;
- Dr. Alfred J. Luessenhop to the position of Resident in Neurosurgery, for the period July 1 through December 31;
- Dr. Donald M. McKee to the position of Third Assistant Resident in Surgery;
- Dr. Charles F. McKhann, III, to the position of Second Assistant Resident in Surgery;
- Dr. Alfred E. Miller to the position of Third Assistant Resident in Surgery;
- Dr. Anthony P. Monaco to the position of Third Assistant Resident in Surgery;
- Dr. Henning Pontoppidan to the position of Chief Resident in Anesthesia, beginning July 15;
- Dr. Judson G. Randolph to the position of First Assistant Resident in Surgery;
- Dr. Robert S. Richards to the position of Resident in Radiology;
- Dr. Sanford I. Roth to the position of Third Assistant Resident in Pathology for one year;
- Dr. Dagoberto Sosa to the position of First Assistant Resident in Neurosurgery, for the period July 1 through December 31;
- Dr. William M. Thurlbeck to the position of First Assistant Resident in Pathology for one year;
- Dr. Alfred L. Weber to the position of First Assistant Resident in Radiology;
- Dr. Sumner I. Zacks to the position of Second Assistant Resident in Pathology for one year.

To extend the appointments of:

- Dr. Sen-itiro Hakomori as Research Fellow in Medicine, through December 31;
- Dr. Benjamin B. Jackson as First Assistant Resident in Surgery, through August 31;
- Dr. George B. Murphy, Jr. as Second Assistant Resident in Surgery, through August 31;
- Dr. Reynout Donner as Assistant Resident in Pathology, through July 31;
- Dr. Hermann K. Schueler as Resident in Urology, through August 31;
- Dr. Shen K. Wang as Assistant Resident in Orthopedic Surgery, for the period July 1 through December 31.

To reappoint:

- Dr. John F. Bertles as Clinical and Research Fellow in Medicine for one year, beginning July 1;
- Dr. William R. Brewster, Jr. as Clinical and Research Fellow in Anesthesia for one year, beginning July 1;
- Dr. Rafael M. Casas as Clinical and Research Fellow in Surgery for one year, beginning July 1;
- Dr. Walter H. Caskey as Clinical Assistant in Medicine for one year, beginning May 1;
- Dr. Leo J. Cass as Clinical Assistant in Medicine for one year, beginning May 1;
- Dr. Chung Hyun Cho as Clinical Fellow in Anesthesia for one year, beginning July 5;
- Dr. Herbert S. Cline as Clinical Fellow in Psychiatry for one year, beginning July 1;
- Dr. Beverly W. Cobbs, Jr. as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;
- Dr. Alan S. Cohen as Clinical and Research Fellow in Medicine for one year, beginning July 1;
- Dr. William P. Corvese as Clinical and Research Fellow in Surgery for one year, beginning July 1;
- Dr. John L. Decker as Research Fellow in Medicine for one year, beginning July 1;
- Dr. Elias C. Dow as Clinical and Research Fellow in Medicine for one year, beginning July 1;
- Dr. Ellis Dresner as Clinical Assistant in Medicine for one year, beginning July 1;
- Dr. Felix G. Freund as Clinical Fellow in Anesthesia for one year, beginning July 17;
- Dr. Joachim S. Gravenstein as Clinical and Research Fellow in Anesthesia for one year, beginning September 1;
- Elizabeth B. Keller, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning July 1;
- Dr. Guy W. Leadbetter, Jr. as Assistant Resident in Urology for one year, beginning July 1;
- Eric H. Lenneberg, Ph.D. as Research Fellow in Psychology, on the Neurology Service, for one year, beginning July 1;
- Dr. Edwin P. Maynard, III, as Clinical and Research Fellow in Medicine for one year, beginning July 1;
- Dr. Hugo M. Palazzi as Clinical and Research Fellow in Surgery for one year, beginning July 1;
- Dr. Joseph D. Sabella as Clinical Fellow in Pathology for one year, beginning July 1;
- Dr. William Sharpe, Jr. as Clinical Fellow in

Psychiatry for one year, beginning July 1;

Dr. Sabino J. Sinesi as Clinical and Research Fellow in Dermatology for one year, beginning July 1;

Dr. John H. Sisson as Clinical Assistant in Medicine for one year, beginning May 1;

Leonard B. Spector, Ph.D. as Assistant Biochemist (Medicine) for one year, beginning July 1;

Mary L. Stephenson, Ph.D. as Research Fellow in Medicine for one year, beginning July 1;

Dr. Edward J. Welch as Clinical Assistant in Medicine for one year, beginning May 1.

To appoint:

Dr. Luis V. Amador as Clinical and Research Fellow in Neurosurgery, for a period of three months, beginning July 1;

Bronius Baskys, M.A. as Research Fellow in Dermatology for one year, beginning July 1;

Dr. Willi Burgi as Research Fellow in Medicine, beginning September 1;

Dr. Richard R. Curtin as Clinical Assistant in Surgery, assigned to Gynecology, beginning August 1, with the privilege of caring for the patients of Drs. Meigs, Ingersoll, and Green in Baker Memorial and Phillips House;

Dr. Robert P. L. des Floris as Clinical Fellow in Pathology, for the period October 15, 1957 through August 15, 1958;

Dr. G. Richard Dickersin as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. H. Robert Dudley, Jr. as Research Fellow in Pathology for one year, beginning July 1;

Dr. Joseph W. Ferrebee as Research Fellow in Pathology for one year, beginning June 1;

Dr. Lionel O. Garrote as Clinical and Research Fellow in Neurosurgery, for a period of six months, beginning September 1;

Dr. William A. Johnson as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. William M. Keynes as Clinical and Research Fellow in Surgery for one year, beginning July 1;

Dr. David M. Klein as Clinical and Research Fellow in Neurosurgery, for a period of six months, beginning July 1;

Dr. William E. Lassiter as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. William F. McNeely as Clinical Assistant in Medicine, beginning July 1;

Dr. Johannes C. Melchior as Clinical and Research Fellow in Psychiatry, beginning July 1;

Dr. Wayne C. Mercer as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Federico Mora as Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. William L. Morgan, Jr. as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;

Dr. Sholem Postel as Clinical Assistant in Medicine for one year, beginning July 15;

Dr. William R. Shelton as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. José R. Solis as Graduate Student Assistant in Pathology, for a period of six months, beginning May 13, with the additional title of Clinical Fellow in Pathology if and when he obtains a temporary license;

Dr. Juan F. Sotos as Clinical and Research Fellow on the Children's Medical Service, beginning July 1;

Anne M. Stoffyn, Ph.D. as Research Fellow in Medicine, on a part-time basis, effective as of May 13;

Dr. Theodore van Ravenswaay as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Alejandro H. Villegas as Clinical and Research Fellow in Surgery for one year, beginning September 1;

Dr. Laszlo O. Vincze as Research Fellow in Surgery, assigned to Gynecology, for one year, beginning July 1;

Benjamin E. Volcani, Ph.D. as Research Fellow in Biochemistry, for the period June 28 through July 31;

Dr. Yang Wang as Clinical Fellow in Medicine, assigned to Cardiology, beginning July 1;

Donald L. Weston, M.A. as Research Fellow in Psychology for one year, beginning September 1.

JAPAN AS I SAW IT

To try to communicate to others what one thinks and feels about such a fascinating country as Japan is a challenge, indeed. Let me begin by describing our arrival in Japan. We landed at Tokyo International Airport at 11 o'clock on a Sunday evening after a long, tedious trip across the Pacific — tired, but not too tired to be excited about finding ourselves in this "mysterious land of the Orient" which we had read about but never actually hoped to see. After the initial processing at the airport we were loaded onto a bus and soon found ourselves winding through the narrow streets of Tokyo on our way to the Air Base where we were to be stationed. By this time the streets were, for the most part, darkened, but occasionally we would pass a brilliantly lighted building where twenty or thirty men could be seen playing some kind of game which involved putting little steel balls into a machine and pulling a lever. I found out later that they were playing "Pachinko", the Japanese equivalent of our pinball game, roughly speaking. Thus our first glimpse of Japan was one which provided a contrast between darkened, peaceful streets and areas of brightly lighted activity. Little did one realize at that time that one would be able to compare so many of the contrasting facets of Japanese culture with the scene one saw from the bus window that night. To give a few examples: the contrast between the quiet dignity of the Japanese man in his home or at his place of business as compared with the laughter and cavorting and singing of the same man as he enjoys an evening out with his friends, drinking sake, singing, and reveling in the entertainment provided by his favorite geisha; the contrast between the relatively peaceful, simple type of life in Japan prior to the opening of its doors to foreign trade, particularly since the occupation by the forces of its conquerors after World War II, and the difficult, complicated type of life-adjustment which must be made by the Japanese people during this postwar era.

The Japanese are a confused race of people at the present time. They can no longer remain aloof from the world. The problems in their attempting to identify with Western powers are many. There is a seething unrest, even in their own government. The Emperor is still held in awe, but there are trends which make one suspect that in the not too many years he will be a mere figurehead. To my way of thinking, it would seem that the previously well-controlled "id" of the Japanese people is becoming not quite so well controlled, as is evidenced by the fact that incidence of major criminal acts in Japan is on the increase. From the point of view of world affairs, this loss of control can perhaps be considered beneficial, since now the Japanese will not have as great a need to engage in periodic wars in order to allow themselves expression of the tremendous hostility which is present in most of them — particularly in the males. Also, in the opinion of the writer, they will be much too busy for many years solving their internal problems to come to the point of thinking about war. When they do emerge from this period of internal struggle, as I feel confident they will because of their great energy and resourcefulness, they will be a power to be reckoned with. When and if they should have to choose whether to be on the side of Communism or on the side of the Western powers, I feel that their choice will not be made from the point of view of principles or affection for either the West or Russia. I would predict that they will make their decision by considering which country they hate the most and which country they owe the most to.

As for psychiatry in Japan, that would be too complicated a subject to go into at this time. It did seem to me, though, that the aim of successful therapy appeared to be to encourage the individual to "get better control of himself" and learn to respect the authority of his parents. In Japan, to be well adjusted seemed to mean the ability to conform. Individuality has not been considered an asset. Now, with the changing values and attempts to identify with the West, this therapeutic aim will have to be modified to allow for more freedom of self-expression and individuality and "ego-growth". Japanese psychiatry has a difficult task ahead of it in helping the Japanese people over the next few years, which probably will be more difficult than any they have yet experienced.

Frederick E. Whiskin, M.D.,
Clinical Assistant in Psychiatry,
McLean Hospital

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
The measurement of pain. Prototype for the quantitative study of subjective responses.
Pharmacol. Rev. 9:59-209.
Beecher, H. K.
On misunderstanding the opportunities of anesthesia. (Editorial)
Anesthesiology 18:498-500.
Gravenstein, J. S., and Beecher, H. K.
The effect of preoperative medication with morphine on postoperative analgesia with morphine.
J. Pharmacol. & Exper. Therap. 119:506-512.

Bacteriology

Blank, I. H., Moreland, M., and Dawes, R. K.
The antibacterial activity of aluminum salts.
Proc. Scient. Sec. Toilet Goods A. 27:24-28.

Dermatology

Blank, I. H.
Action of emollient creams and their additives.
J.A.M.A. 164:412-415.
Rosenthal, A. L., and Lever, W. F.
Involvement of the skin in renal carcinoma.
A.M.A. Arch. Dermat. 76:96-102.

General Surgery

Cope, O., Culver, P. J., Mixter, C. G., Jr., and Nardi G. L.
Pancreatitis, a diagnostic clue to hyperparathyroidism.
Ann. Surg. 145:857-863.
Waddell, W. R., and Bartlett, M. K.
Antral exclusion with vagotomy for duodenal ulcer. I. Acid secretory studies on 50 patients.
Ann. Surg. 146:3-11.
Waddell, W. R., and Scannell, J. G.
Anterior approach to carcinoma of the superior mediastinal and cervical segments of the esophagus.
J. Thoracic Surg. 33:663-669.
Zuidema, G. D., Clarke, N. P., and Smith, G. D.
A versatile anesthesia machine for experimental surgery.
Surgery 41:787-789.

Neurology, Neurosurgery, and Psychiatry

Blane, H. T., and Glud, E.
The psychologist and the psychiatric team in a respirator center.
J. Hillside Hosp. 6:24-33.
Cath, S. H., Glud, E., and Blane, H. T.
The role of the body-image in psychotherapy with the physically handicapped.
Psychoanalyt. Rev. 44:34-40.
Gellert, E.
Systematic observation: A method in child study.
Harvard Ed. Rev. 25:179-195.
Talland, G. A.
Do therapists and patients share norms on the content of group discussion?
Group Psychotherapy 10:10-21.
Talland, G. A.
Rate of speaking as a group norm.
Human Organization 15:8-10.
Waksman, B. H., and Adams, R. D.
Studies of the effect of the generalized Shwartzman reaction on the lesions of experimental allergic encephalomyelitis.
Am. J. Path. 33:131-153.
White, J. C.
Neurosurgical emergencies which the general surgeon must be prepared to treat. (Editorial)
Surgery 41:669-671.

Otolaryngology

Ingalls, T. H., Kelemen, G., and Curley, F. J.
Development of the inner ear after maternal hypoxia.
A.M.A. Arch. Otolaryng. 65:558-566.
Kelemen, G.
Embryonaler Ohrbefund nach operativer Entfernung wegen mütterlicher Nephritis.
Monatschr. f. Ohrenh. 91:136-145.

Physiological Chemistry

Klein, E., Garrett, J. V., and Lever, W. F.
Effects of intravenous administration of fat emulsions and their emulsifying agents. II. Effects of phosphatide preparations on the coagulation of the blood of dogs.
J. Invest. Dermat. 28:321-324.
Klein, E., and Lever, W. F.
Inhibition of lipemia clearing activity by serum of patients with hyperlipemia.
Proc. Soc. Exper. Biol. & Med. 95:565-567.
Lever, W. F., and Baskys, B.
Effects of intravenous administration of fat emulsions and their emulsifying agents. I. Effects on clearing factor activity, electrophoretic pattern and clotting time of blood of dogs.
J. Invest. Dermat. 28:317-320.

Physiology

Zuidema, G. D., Silverman, A. J., Cohen, S. I., and Goodall, McC.
Catechol amine and psychologic correlates of vascular responses.
New England J. Med. 256:976-979.

Surgery—Thoracic

Wilkins, E. W., Jr., and Sweet, R. H.
Medical progress: Carcinoma of the lung.
New England J. Med. 256:346-351.

Books

Meigs, J. V., and Sturgis, S. H.
Progress in gynecology, Vol. III.
New York, N. Y., Grune & Stratton.

VOLUNTEER DEPARTMENT √

The first meeting of a new standing Committee established by the Trustees, to be known as the Trustee Advisory Committee to the Volunteer Department, took place on May 21. The membership of the Committee, representing various departments and services associated with the Hospital, is as follows:

Trustees
- Dr. Arthur W. Allen, Chairman
- Mrs. Robert Homans
- Mr. John E. Lawrence

Ladies' Visiting Committee
- Mrs. Floyd H. Blackman
- Mrs. Reginald Jenney

Staff Wives Association
- Mrs. Charles B. Burbank
- Mrs. Robert S. Palmer

Board of Managers, Vincent Memorial Hospital
- Miss Dorothy Bartol

Boston Chapter, Red Cross
- Mrs. Amory Goddard

Medical Staff
- Dr. Edward F. Bland

Surgical Staff
- Dr. H. Thomas Ballantine, Jr.

Nursing Service
- Miss Edna S. Lepper

Social Service
- Miss Josephine C. Barbour

Administration
- Dr. Dean A. Clark

Director of Volunteer Department
- Miss Mary Ruth Wolf, Secretary

Dr. Allen, Chairman of the Committee, presided. He welcomed the members of the Committee and asked for discussion regarding the day and time of the next meeting, with the frequency of future meetings to be determined at a later date.

Dr. Allen called on Dr. Clark to explain the function of the Committee. Dr. Clark began by describing the two somewhat similar Trustee-appointed Committees in the Hospital — the Advisory Council to the School of Nursing and the Trustee Advisory Committee to the Social Service Department — as Committees which are most helpful to these services. He then explained that the function of this new Trustee Committee would be to consider all problems of recruitment and assignment of volunteers in the Massachusetts General Hospital and the Vincent Memorial Hospital, and to coordinate and interpret the purpose and program of the Volunteer Department to all concerned.

Dr. Allen then called on each representative to give a resumé of the function of his particular organization or service.

Mrs. Blackman said that the Ladies' Visiting Committee was enthusiastic about this new Advisory Committee and believes her group will be very helpful in assisting the members to meet their responsibilities. She explained that the Ladies' Visiting Committee was originally formed to visit patients who had emotional anxieties and discomforts — especially those who had come from a distance and, therefore, had few or no visitors. This function is still in effect. The second major function is to promote good will; and the third is to serve the Hospital, as a group or individually, in any emergency or special need as the occasion arises. She concluded by saying that the Ladies' Visiting Committee is always interested in examining and studying its service to the Hospital.

Mrs. Burbank explained that the Staff Wives Association was organized six years ago for the purpose of giving service to the Massachusetts General Hospital and extending hospitality to professional visitors and doctors from other countries. Since that time three teas a year have been given for these visitors, and out of these contacts has grown the Reception Center, which has been in operation for a year and a half. This Center is a referral center to help visitors get settled in Boston as rapidly as possible so that they may make the best use of their professional time at the Hospital. The Reception Center is staffed by approximately 50 volunteers. The Association also has a housing committee and a furniture exchange which loans furniture to the doctors and their families. A music committee arranges concerts in the Chapel for patients every other week from October through May. According to the bylaws of the Association, "membership is open to all wives of the Visiting Staff of the Massachusetts General Hospital and any other women in sympathy with our aims". There is a total membership of 533, but not all of these members are active.

Mrs. Goddard gave the following statistical report of the Red Cross Volunteer Services to the Massachusetts General

Hospital from May 1, 1956 to May 1, 1957: Volunteers teach arts and skills to the patients in special wards (such as the polio ward), textile painting, pottery, shellcraft, Swedish weaving, etc. Completed articles belong to the patients. Red Cross volunteers also set up looms for the occupational therapists. A monthly average of 6 volunteers gave 385 hours. Gray Ladies assisted with non-nursing duties in the clinics and as receptionists. A monthly average of 24 volunteers gave 3,046 hours. Members of the Volunteer Nurses' Aide Service work as aides to professional nurses. A monthly average of 17 volunteers gave 2,349 hours. Motor Service volunteers transport patients daily to and from the Hospital. During the year 397 trips were made, involving 159 patients. Production Service volunteers make pajama pants, half-sheets, masks, scultetus bandages, surgeons' gowns and caps, towels, slings, T-binders, and neuro sponges. Six hundred seventy-eight items were presented to the Hospital by the Junior Red Cross. These included tray favors, centerpieces, soft toys, checker and cribbage boards, and jig saw puzzles. Kindergarten boxes were donated for Easter. An exhibit of Junior Red Cross production articles of all kinds was on display in the Brick Corridor of the Hospital during the summer. Two classes in First Aid Service were given for student nurses by the Red Cross.

Miss Barbour told us that at present there are 30 social workers, 15 clerical workers, and 5 aides. The patients are referred to social workers by the doctors. A social worker's duties primarily are to help the patient adjust to severe illness and handicaps, to help him understand and accept changes in future work, and to help him and his family work together toward these ends. The social worker also assists in the placement of patients in nursing homes and helps them to make use of community resources. Sixty percent of this patient load falls into clinic grouping, which means service outside the Hospital. Volunteers are not assisting in this department, as it would be necessary for them to have a knowledge of human dynamics and considerable training to prepare them for service.

Dr. Bland spoke on behalf of the Medical Staff and expressed his interest in hearing the various speakers describe their services to the Hospital. He pointed out the importance of making the Staff more aware of these services. He emphasized the importance of training volunteers so that their services may be more effective, and the equally great importance of making volunteers feel that their services are appreciated.

Miss Lepper, speaking about nursing, said it is the largest department in the Hospital, with a staff of approximately 1,000. It is divided into two distinct sections — the School of Nursing, and the Nursing Service. She mentioned a number of departments which affect the Nursing Service and pointed out that, when these departments are well staffed and well organized, the nurse can devote herself to nursing care. She also spoke about the changing needs from day to day for volunteer service, due to the rapid turnover of patient load and staff. She expressed appreciation for all volunteer services.

Miss Wolf explained the development and the philosophy of hospital volunteer service today, and distributed packets containing printed material on the Volunteer Department for background information. She assured everyone that questions left unanswered at this meeting would be taken up at a future time.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

With vacations over and the children back in school, the activities of the Staff Wives Association will move into high gear. Planning for the busy year ahead are the following officers for 1957-1958:

President: Mrs. Charles B. Burbank
Vice-President: Mrs. Alfred Kranes
Secretary: Mrs. C. Miller Fisher
Treasurer: Mrs. Francis G. Barnum, Jr.
Chairman of Special Projects: Mrs. Howard Ulfelder

Committee Chairmen

Teas: Mrs. Glenn E. Behringer
Mrs. Walter T. St. Goar
Flowers: Mrs. Frederic Tudor
Music: Mrs. John D. Crawford
Publicity: Mrs. Claude E. Welch
Furniture: Mrs. Paul M. Howard
Mrs. Vincent P. Perlo
Housing: Mrs. Benjamin Castleman
Mrs. Richard G. Whiting
Reception Center: Mrs. Perry J. Culver
Mrs. Byron H. Waksman

Community Chairmen

Arlington, Malden, Melrose, Stoneham, Wakefield, and Winchester: Mrs. Robert L. Berg
Auburndale, the Newtons, and Waban: Mrs. E. Wayne Wilkins, Jr.
Belmont: Mrs. Allan L. Friedlich
Boston: Mrs. Roy E. Mabrey
Braintree, Dedham, Milton, Needham, and Quincy: Mrs. H. Thomas Ballantine, Jr.
Brookline: Mrs. H. Dunster Howe
Cambridge: Mrs. Jerome L. Weinberger
Chestnut Hill: Mrs. Carter R. Rowe
Cochituate, Natick, and Wellesley: Mrs. Jackson M. Thomas
Concord, Lexington, Lincoln, Waltham, Watertown, Wayland, and Weston: Mrs. Robert S. Shaw
North Shore: Mrs. Joseph Stokes, III

DISTAFF CLUB

On July 25 Dr. and Mrs. Dean A. Clark and the Distaff Club entertained at a reception to welcome the new House Staff and their wives. It was a most pleasant beginning for the year's activities, in spite of the sudden shower which forced us to move indoors.

The Club held individual area meetings at members' homes during August. It is felt that this is a good way for the members to meet each other in smaller groups.

We are looking forward to the September meeting with special interest. This will be held on September 26 in the Penthouse. Dr. Clark will be the speaker. He will give an introduction to the Massachusetts General Hospital for the newcomers. His talk will be preceded by a tour of the Hospital conducted by Mrs. Soma Weiss, Consultant for Community Relations at the Massachusetts General. Both old and new members are welcome at this gathering.

Recently elected officers of the Distaff Club are:

President: Mrs. William L. Morgan, Jr.
Vice-President: Mrs. Robert S. Harper
Secretary: Mrs. John W. Grover
Treasurer: Mrs. William E. Karnes

MASSACHUSETTS EYE & EAR INFIRMARY

At a meeting of the Executive Committee, Massachusetts Eye and Ear Infirmary, held on June 10, the following votes were taken:

Dr. John J. Sullivan appointed Assistant in Ophthalmology;
Dr. Robert R. Trotter reappointed Assistant to the Chief of Ophthalmology for one year, beginning July 1;
Dr. Raffaele N. Vallesi appointed Fellow in Otolaryngology for six months;
Dr. Francis J. West, Assistant Surgeon in Ophthalmology, granted a four-month leave of absence because of illness.

At a meeting of the Board of Managers, Massachusetts Eye and Ear Infirmary, held on June 27, the following votes were taken:

Dr. Paul A. Chandler to be placed on the Consulting Staff, beginning July 1, and in addition to be given the title of Associate Director of Resident Training;
Dr. Mahlon T. Easton to be promoted from Associate Surgeon to Surgeon in Ophthalmology;
Dr. Paul G. Haire to be given courtesy staff privileges when he reaches retirement age from the active staff on June 30;
Dr. David H. Scott to be promoted from Assistant to Assistant Surgeon in Ophthalmology;
Dr. Taylor R. Smith to be promoted from Assistant to Assistant Surgeon in Ophthalmology;
Dr. William Stone, Jr. to be promoted from Assistant to Assistant Surgeon in Ophthalmology;
Dr. Garrett L. Sullivan to be promoted from Assistant Surgeon to Associate Surgeon in Ophthalmology.

In classes held at the Eye and Ear Infirmary, patients from hospitals all over New England learn how to speak with a new esophageal voice within a matter of weeks after their laryngectomy. They are taught how to control the intake and release of air so that it will vibrate on the muscles of the esophagus to produce a voice different from the normal voice only in a certain hoarseness of tone, such as is usually associated with laryngitis.

Rehabilitation of the cancer of the throat patient is begun as soon as the necessity for the operation has been established. When the surgeon explains the need to remove the vocal cords, he can assure the patient that this will not leave him speechless. A new voice is within the goal of every patient; no one is ever too old to learn to speak again.

Even before the operation, the patient is introduced to the esophageal voice teacher, Mrs. Paul A. Doehler—herself a laryngectomized patient of some years ago. Mrs. Doehler, a former teacher of remedial reading, stresses the importance of personal contact with the patient and his family before the operation. This interview supplements the conference with the physician and gives the prospective patient an opportunity to hear the new voice and to ask about speech training, his future life, and any other questions where the answers might help him face the future more optimistically.

Meeting with the family and the patient gives them some idea of what they are to expect. The family should be told that after the operation the patient should not be allowed to whisper. Instruction will begin as soon as the Levin tube has been removed. The family should also be reminded that they must always wait for the patient to finish speaking and not attempt to speak for him. The education of the family is in many respects as important as the teaching of the new voice to the patient.

By beginning instruction while the patient is still hospitalized, Mrs. Doehler is able to check any bad habits which might develop. She begins the lessons — individual instruction every day at first — in less than a week after the operation, if possible. Emphasis is on the development of speech and postoperative rehabilitation rather than on the actual operation that the patient has undergone. If the patient shows nervous tension, Mrs. Doehler can reassure him by reminding him that she, too, had the same operation and faced the same experience and so recognizes the strain he is undergoing.

After the patient understands the basic principle of taking in air and exhaling it, he begins with the easier sounds — vowels combined with consonants, such as ba-be-bi-bo, la-le-li-lo. As breath control is acquired, the drill is doubled to baba, bebe, bibi, bobo, etc. With sufficient practice there is no limit to the number of syllables or the length of a sentence a patient can say. With adequate training there will be no hesitation between words, nor will the intake of breath be always perceptible to the listener. Simple conversation is begun as soon as possible, so that the student will feel he is making real progress toward useful speech.

Although the value of using phonetics in speech and voice training has long been recognized, the esophageal voice program set up by Mrs. Doehler was the first where the basic training was devoted entirely to phonetics. From her knowledge of phonetics Mrs. Doehler shows how the lips and tongue are used to give tone and clearness of enunciation. Basic phonetic training is extremely valuable to a patient with a language handicap, and Mrs. Doehler points out that many of her patients now speak more clearly with their new knowledge of phonetics than they did with their regular voices.

At first, ginger ale is used to help with the exhaling of air from the stomach, but soon the student can dispense with this aid. When he has become sufficiently expert to no longer need a lesson each day, he may join the group classes that meet on Saturdays. These students should, however, be at the same stage in rehabilitation, since an excellent speaker or a beginner tends to distract the mental balance of the group and thus hinder its progress. Class instruction calls for more discipline and skill on the part of the teacher.

Mrs. Doehler feels it is necessary to uphold high standards at all times. She points out to the beginner that this is to be his own voice, through developing unused physical equipment and completely without the aid of artificial assistance. The patient must use his new speaking apparatus as easily as he did his original voice. Thus, he is trained to be ready to speak at all times and under any situation. His response should be clear-cut and spontaneous, and without delay. Every laryngectomized patient should be able to call "Fire" in a loud voice.

To instruct her pupils in the use of the telephone, Mrs. Doehler prepares them in advance by arranging a time when she will call them, and suggesting that when the telephone rings they are to answer "Yes." They are not to try to shout nor hold the receiver too close to their mouths. Later, Mrs. Doehler calls them frequently at unexpected times. Progress is noted, and steps are taken toward improvement wherever necessary.

It is very natural for every person to like to hear his own voice, and the laryngectomized pupil is no exception. There is a certain curiosity as to just how he sounds and whether or not he can be understood. Early in the program the pupil makes a recording of his voice, and, as he progresses, he makes additions to this record so that he can measure his achievements and improve weak spots.

Mrs. Doehler feels it is important that the pupil gain control and develop correct habits of articulation before concerning himself with volume. Once he has acquired adequate control and articulation, he is given counting exercises and a "ladder exercise" where each ascending sound is made in a louder tone. Since it is easier to control the voice in softer or descending tones, emphasis is placed on the ascending exercise.

Since reading aloud aids normal tone Mrs. Doehler trains her patients to do some reading. Selections from an editorial page of a newspaper offer a challenge to the pupil who is really interested in perfecting his voice. He must decide in advance just how much he thinks he can read in one breath, and he must remember to swallow before he begins. There should be only one beginning, not several starts and stops which will immediately destroy or disturb the continuity.

To further improve length and rhythm, Mrs. Doehler makes use of the Psalms. When necessary in the beginning stages she divides the lines into shorter phrases, then gradually doubles the phrases until the line can finally be read in its entirety.

The most significant advantage of teaching esophageal speech by basic exercise is that it gives the patient a pattern to fall back upon when he is confronted with a new and difficult word. At a time when he is facing so many new adjustments, he is saved the embarrassment of groping for words he has not yet mastered. Once he has gained control of his voice through phonetic drill, he will approach a word like "manipulate" with confidence, knowing that it falls into the same pattern as "babababa".

Conscientious drill and practice of the basic exercises will produce a voice which is more nearly normal than that developed by any other method of speech training. In the final analysis, the skill and success of the teacher is measured by the voice of the pupil.

Last December Mrs. Doehler started a new series of speech classes in Manchester, New Hampshire, for laryngectomy patients in that area. In addition to her daily classes at the Infirmary, she has also for the past seven years been conducting weekly courses in Providence, Rhode Island. Financial sponsorship in each case comes from the local Division of the American Cancer Society, and the classes are free to the student-patients.

To aid in establishing a high standard of esophageal voice teaching, Mrs. Doehler gave a teacher training course at the Infirmary in June 1955. The twenty persons from all over the country who attended the course not only received instruction in Mrs. Doehler's method of teaching esophageal speech, but also heard lectures on the pathologic effects of laryngectomy, basic speech formation and development, social service aspects and rehabilitation of patients, and, at the final sessions, received individual assistance in actual teaching.

The training course was sponsored by the American Cancer Society, Massachusetts Division. Recognizing the value of the course, the National Office of the Cancer Society recommended to its sixty divisions across the country that they give scholarships to qualified persons, and eight of the participants came on such scholarships.

A few years ago Mrs. Doehler wrote down her methods of instruction in esophageal speech, and they were published in a copyright manual under the auspices of the Cancer Society. This was the first time that a textbook had been published to be used by both teachers and student-patients.

The long-playing record that Mrs. Doehler made last year of her unique method of teaching esophageal speech is also the first of its type that has been available. Upon hearing Mrs. Doehler's voice, the patient acquires a feeling of self-confidence and a better understanding of the primary principles of esophageal speech. The esophageal speech record serves as a guide and inspiration for the patient to overcome his handicap.

A short 16-millimeter color-sound moving picture, "We speak again", was also made through the Cancer Society, with Mrs. Doehler and one of her pupils as its co-stars. The picture is constantly being lent to hospitals, health organizations, clubs, etc. all over the country, and always wins wide applause because of the tremendous human interest in this story of how a teacher, without the usual voice, teaches voiceless pupils to speak again.

Since Mrs. Doehler first began her esophageal voice teaching, she has addressed hundreds of groups on her method of rehabilitation for laryngectomy patients. Her "students" are continually featured in newspaper and magazine "success stories". So that more cancer of the throat patients may know about the rehabilitation classes, Mrs. Doehler has had many interviews on the radio and on television. At the opening of the Cancer Drive several years ago, she appeared on television with one of her pupils, a Boston lawyer, who had been operated upon in January of that year and at the time of his appearance, the last of March, had already been in court twice — and had won both of his cases.

Mrs. Doehler is President of the Cured Cancer Club — an organization originating from the group interest of her pupils, but now numbering among its 230 members patients who have recovered from other forms of cancer besides cancer of the throat. Last year the Club presented the Infirmary with $10,000 for its Free Bed Fund, which helps pay for medical treatment of needy cancer of the throat patients. It is now working toward another $10,000. The fund has been raised entirely by the combined efforts of the Club members, under Mrs. Doehler's leadership. Food sales, card parties, a concert, rather than solicitation for large gifts, have built the fund, dollar by dollar, since it was started in 1948. Recently, 100 Cured Cancer Club members gathered at the Statler Hotel to celebrate the Club's 10th anniversary of its founding.

Mrs. Doehler has been asked to give a course in "Organic disorders of speech" at Emerson College this year. In recognition of her professional achievement, Emerson's faculty and trustees voted to confer an honorary degree upon Mrs. Doehler, and at the commencement exercises of the College on June 9, she received the degree of Master of Arts.

Joan Temkin,
Public Relations Assistant
Massachusetts Eye & Ear Infirmary

New addresses:—

Dr. George Acs (res. fel. *Biochem.* 1957), Rockefeller Institute for Medical Research, 66th St. & York Ave., New York 21, N. Y.
Dr. Dirk Baier (clin. fel. *An.* 1957), (136) Munich, Koniginstr 27, Germany
Dr. Richard M. Barry (a.r.p. 1957), 34 Martling Ave., Pleasantville, N. Y.
Dr. Robert D. Breer (a.r.p. *C.M.* 1957), 243 Division St., Amsterdam, N. Y.
Dr. Howard S. Cameron (sr. r.s. *Or.* 1957), 186 Worthy Rd., London, Ontario, Canada
Dr. Richard R. Curtin (*S.* 1953), 226 Marlborough St., Boston, Mass.
Furio D'Abramo, Ph.D. (res. fel. *Biochem.* 1957), Rockefeller Institute for Medical Research, 66th St. & York Ave., New York 21, N. Y.
Dr. Benjamin F. Gill (a. *Psychiat.*), 270 Commonwealth Ave., Boston, Mass.

---

Brief bits:—

Dr. Edward B. Benedict attended several meetings during May. On May 4-7 he was present at the meetings of the American Association for Thoracic Surgery, held in Chicago; on May 15 he went to the Editorial Board meeting of *Gastroenterology,* in Denver; on May 16 he attended the meeting of the American Gastroscopic Society in Colorado Springs and took part in a panel discussion on "The evaluation of clinical methods for examination of the esophagus"; and on May 17 and 18 he attended the meetings of the American Gastroenterological Association in Colorado Springs.

Dr. Frederic M. Blodgett has become Assistant Professor of Pediatrics at Yale Medical School. His address is Grace-New Haven Hospital, New Haven, Conn.

Dr. Benjamin Castleman and Dr. Allan L. Friedlich were two of the principal speakers at the meeting of the New Mexico Heart Association, held in Santa Fe on May 18. The morning session was devoted to a symposium on coronary heart disease. In the afternoon, Dr. Castleman spoke on "Atheromatous emboli to the kidney following aortic surgery", and Dr. Friedlich was a member of the panel discussing "Open heart surgery".

Dr. Oliver Cope will participate in a panel discussion on "Hyperthyroidism" at the One Hundred Seventh Annual Session of the Medical Society of the State of Pennsylvania, held in Pittsburgh on September 17.

David M. Geller, Ph.D. (gr. stud. a. *Biochem. Res.* 1957) has gone to the University of Oxford in England to study biochemistry with Dr. H. A. Krebs.

Dr. Oscar Hirsch delivered a paper at the 78th Annual Meeting of the American Laryngological Association, held in Washington, D. C., last May. This was done at the invitation of the Association's president, Dr. LeRoy A. Schall. The title of the paper was "The role of rhinology in pituitary surgery". Dr. Hirsch and Dr. Hannibal Hamlin presented a paper at the 9th Annual Meeting of the American Academy of Neurology, held in Boston last April. The subject of their paper was "Pathogenesis of hypophyseal duct tumors".

Dr. Manucher Javid (r.s. *N.S.* 1952) was recently promoted to Associate Professor at the University Hospitals in Madison, Wis. He also was the recipient of "The Annual Regular Fellow Award" of 1957—a tribute conferred yearly by the medical students of the hospital.

Mary Ellen Jones, Ph.D. (assoc. biochem. *Res. Chem.* 1957) assumed the position of Assistant Professor of Biochemistry in the newly formed Department of Biochemistry at Brandeis University on September 1.

Dr. Jacob S. Mager (res. fel. *Biochem.* 1957) will join Dr. Boris Magasanik in the Department of Bacteriology at Harvard Medical School for a few months before returning to Israel, where he is Lecturer in Biochemistry at the Hebrew University-Hadassah Medical School.

Dr. Yoshitsugu Nose (res. fel. *Biochem.* 1957) has resumed his position as Assistant Professor of Biochemistry at Kyoto Prefectural University Medical School in Kyoto. Japan.

Dr. Carter R. Rowe was lecturer at the Law-Science Congress, held in Chicago last July. His subjects were "Medico-legal aspects of the low back", "Whip-lash injuries of the cervical spine", and "Orthopedic injuries in the aged".

Dr. Richard H. Sweet has fulfilled the following speaking engagements since his last report to us: At the Section on Surgery, New York Academy of Medicine meeting, held in New York City last February, his subject was "Surgery of the esophagus"; at the meeting of the Society of Head and Neck Surgeons, held in Boston in April, he spoke on "Carcinoma of the cervical esophagus"; and at the meeting of the Detroit Surgical Association on May 10, he gave a talk on "Some problems in the field of esophageal surgery".

Benjamin E. Volcani, Ph.D., who was here as a Research Fellow in Biochemistry for the month of July, has resumed his work in the Department of Biochemistry at the University of California in Berkeley.

We received the following note from a member of our staff: "I am enclosing some notes which I believe should go into THE NEWS. Dr. David Weisberger's activities have been many, and have gone largely unrecognized

No. 68 in a series of Staff photographs
Dr. Howard B. Sprague, member of the Board of Consultation

by his colleagues here at the Hospital. An article by Dr. Weisberger on 'Precancerous lesions' appeared in the *Journal of the American Dental Association* last April, as part of a symposium on oral malignancies. On May 3 he delivered a lecture at the Veterans Administration Hospital in Brooklyn, N. Y. He was the principal speaker at the Annual Meeting of the Northwest Academy of Dental Medicine, held in Sun Valley, Idaho, May 11-16, and later addressed the Idaho State Dental Society. On May 30 he was the recipient of Honorary Membership in the American Academy of Dental Medicine. And on June 14-15 he attended meetings of the Council on Dental Therapeutics, held in Chicago by the American Dental Association."

Dr. Claude E. Welch was guest speaker at the Dallas Southern Clinical Society Meeting on March 16, at the Southeastern Surgical Congress in St. Petersburg, Florida, on April 1, at the Sectional Meeting of the American College of Surgeons in St. Paul, Minnesota, on April 8, and at the Annual Meeting of the British Columbia Surgical Society in Vancouver on May 3.

* * *

We were delighted to receive this letter from Dr. Horace B. Frost (*E.S.* 1897), our "singleton" in Lavonia, Georgia:

> It is good to be classed as a big toad in a little puddle, but the real distinction is to be an MGH-er.
>
> You have the record of my 65th Harvard Commencement and the 61st from the Medical School. That leaves but little to report save the keen pleasure of recent reunions.
>
> Since January 1955 I have been in Lavonia, located in northeast Georgia. There is not much of special interest and no conflict of ideas in this little town. I am no longer professional—just plain "Doc" to the natives and Uncle Horace to my two nieces and two nephews.
>
> I hope that the above report finds "you all" well and happy.

This letter from the daughter of a past patient, addressed to the two physicians who were in charge of the case, speaks for itself. As one of the recipients commented: "I consider this a great compliment — exactly the sort of feeling we would like to achieve with *every* patient." The letter reads:

> So often since my mother passed away a year ago last May I've planned to sit down and write you a letter, but somehow time just never seemed right for it. So I'm very tardy in writing to thank you for the wonderful care and attention you gave her when she went into the clinic for treatment.
>
> I wonder if you realize how much your courtesies and advice meant to her during the past ten years or so. The fact that you took time to speak to her in the waiting room, tie her sneaker, or help her to the wheel chair—those things that took your time and probably seemed unimportant to you meant a great deal to her. You listened to her complaints and were thoughtful and not hurried; you did extra things you really didn't have to do—your medical advice was enough to give in itself—and I'm grateful to you beyond words. I guess you know how one feels about one's mother. Somehow you feel that people should be extra nice to her because she is your mother, and rudeness or thoughtlessness always seem worse when she is concerned.
>
> Words are really feeble messengers when you try to convey feelings, but if you and all the other doctors in your clinics could only be made fully aware of the great service they render by giving their attention and—yes, it sounds foolish, but—giving a measure of love in their association with clinic patients, I believe they would feel more rewarded than they must feel when they sit down and think that their time is going to patients who pay them nothing.
>
> You know, it must be easy for a doctor to be nice to an attractive young patient with something specially wrong that interests him. My mother was old and I suppose had the usual old age illnesses, yet you doctors gave her the kind of attention that brings the old-fashioned word "gentleman" to mind. There is something in the Bible about the heathen being nice to those they love, but the believer has the whole world for his neighbor.
>
> Again I say thank you. God will bless you for your unselfishness. If this letter can be passed along to those other doctors in the other clinics who were her friends also, I'd appreciate it. Perhaps something was found from my mother's autopsy examination that will help you with other patients. I certainly trust so. I echo mother's many-times-spoken gratitude when I write this letter to you.

This letter, dated August 15, 1957, has been sent to all members of the Visiting Staff, House Staff, and Department Heads:

VACCINATION AGAINST ASIAN INFLUENZA

> Following the advice of the Surgeon-General of the Public Health Service, the General Executive Committee has urged that all members of the Staff, House Staff, and all personnel be vaccinated against the Asian influenza as soon as vaccine is available. While the disease is mild, of short duration, and has few complications, vaccination is advised in order to prevent large simultaneous numbers of cases among hospital personnel with consequent interference with the vital functions of the Hospital.
>
> A Policy Committee on Vaccination has been formed, and Dr. Gerald S. Foster, 1106 Warren Building, has been appointed Hospital Coordinator for Vaccination.
>
> Department Heads, Chiefs of Service, Chief Residents, and Supervisors in various services and departments will be notified when and where their people may be vaccinated. Since the vaccine will be coming in only gradually, the vaccination program will necessarily extend over several weeks.
>
> Members of the Staff who have received an offer of anti-Asian influenza vaccine for themselves and their "nurses" are urged by the Policy Committee on Vaccination to accept the offer immediately, send for the vaccine and use it on themselves and any other person they wish. To the extent possible, it is requested that the second dose be used on some other person on the Hospital's staff or other personnel. A note should be made of the date, the names of the people vaccinated, and this should be sent to Dr. Foster.
>
> Any unused doses of vaccine will be gratefully accepted by the Pharmacy.
>
> **Dean A. Clark, M.D.,**
> *General Director*

THE NEWS

No. 170 Boston, Mass. October 1957

THE INTERNATIONAL ROLE OF THE M. G. H.

The world-wide influence of the Massachusetts General Hospital today is to its membership both a satisfaction and a constant challenge. Its tradition, its evolution, and its leadership have shown a steady growth ever since the Hospital opened its doors more than a century ago. Although signal events such as the introduction of surgical anesthesia have periodically brought the Hospital into the limelight, it has been only since the close of the Second World War that we ourselves of the staff have become cognizant of its real position in the world. To those of us who have had the opportunity to travel widely this position has become increasingly evident; but because it is not so well appreciated by everyone, whether working at the Hospital or not and whether or not New Englanders, it has seemed worth while to present a brief review of the history and current status of the international role of the M. G. H.

From the very beginning in the first quarter of the nineteenth century the founders of the Hospital and its staff members were familiar with the foreign medical literature and themselves made medical pilgrimages abroad. In the Hospital's earlier years and in fact right down to the turn of the century Paris, Vienna, and London were the meccas. MGH doctors walked the wards with the famous Louis in Paris. In fact, Oliver Wendell Holmes in his "Ballad of the stethoscope" poked fun at the smart young doctors coming back to Boston from Paris armed with the new stethoscopes of the first half of the nineteenth century. When Vienna became a popular medical center to visit later in that century it became the custom for many of the MGH graduates to live there in quarters which were passed on from one group to another. Edinburgh and Dublin were important places also for young doctors from this side of the water. In the 1880's my own father, after his medical school studies at the Massachusetts General Hospital, spent two years in Paris, Vienna, Edinburgh, and London. In London he walked the wards with Lister after convalescing from smallpox which he had acquired in the Pesthouse in Paris.* In Dublin in midcentury the Meath Hospital where Stokes was medical chief and the Rotunda of obstetric fame were world renowned; last June I had the pleasure of visiting these historic places which I hope may again be restored someday to their useful international role of years ago.

For a hundred years the Hospital grew quietly and steadily — a local landmark and increasingly a national one too. It was, for example, quite in order for the Massachusetts General Hospital to be asked, along with a small group of similar hospitals in the U. S. A., to furnish one of the first lot of Base Hospital Units for the American Expeditionary Force in the First World War, but it had not yet attained its present status as an international medical center. This came, however, very soon after. Two events, which were the result of pioneering by Richard C. Cabot and Ida M. Cannon in the early years of the twentieth century, did increase the national influence of the Massachusetts General Hospital even before the First World War and both have had since then an international importance. Those events were the introduction of hospital social service and the beginning of the publication of the Clinico-Pathologic Conferences.

During the first fourteen years of the twentieth century MGH graduates were still going abroad for postgraduate studies. Germany had become a popular center for such studies and again filled this role later (in the 1920's and 1930's) until Hitler took over. The older universities and clinics in Vienna, Paris, and London also still attracted a good many. Professors elsewhere too, in Switzerland, in the Low Countries, and in Scandinavia, taught our young doctors. In 1913 Dr. James Howard Means and I went to Europe after graduation from the Medical Services to prepare for our specialties — he under Krogh in Copenhagen and I under Lewis in London.

The First World War dealt a serious blow to the Old World in Europe and this fact plus the steady growth of our medical schools, hospitals, and research institutes resulted in a great change in the relative potentialities of medical science in the U. S. A. and Europe. This change went on steadily, hardly noticeable to us at first but more and more manifest with the rise of the fascist dictators. There were, to be sure, occasional visitors from abroad to walk our wards with us, to observe our researches, and even to work with us in our laboratories, but they were not numerous.

Then came the Second World War which abruptly changed the picture. The first effect was to retard advances in medical science the world over except for a few spectacular achievements like the introduction of the antibiotics and specialized traumatic surgery. We, however, suffered far less than those living in the Old World. There began during that period of some six years (from 1939 to 1945) the first of the stream of medical visitors, young and old, to the Massachusetts General Hospital as well as to many other hospitals in the country. This vanguard came from Latin America, which had in former years gone largely to Paris for postgraduate training. This new situation and the greater ease of travel to the U. S. A. established a habit that has persisted in our relations with all parts of Latin America, namely, Mexico, Central America, the West Indies, and South America. Several of us on the staff have developed close friendships with physicians from Latin America who have worked with us in clinics and laboratories. I myself had the good fortune to visit medically in Mexico City in 1938 and later to see in their home towns a considerable number of Latin-American friends during a medical tour of South America in 1952 and other visits to Mexico and the West Indies.

When World War II ended four things happened to our international medical relations. In the first place, doctors came to visit us from the Old World, some of them still in uniform during that first year of 1945 to 1946, and they told us what has since come true — that despite our first surprise to find that we were now a medical mecca, we must prepare ourselves at once for a great increase of graduate students, young and old, from the Old World. This prophecy became quickly true and almost overnight we found that our role over here had changed from students going east to teachers of those who came west. This, of course, has not meant that we ourselves should not continue to go abroad to study and work with stimulating masters of medical science anywhere — Latin America, Europe, Asia, Australasia, and Africa, but for most young American graduates the opportunities are greater here.

These doctors from overseas have formed a very appreciable proportion of the members of our graduate courses and of our research staffs. And the entire membership of the M.G.H. — doctors, nurses, social service workers, technicians, and employees — have cooperated magnificently to welcome and to help these foreign visitors of ours.

The second thing that happened to us during and after the Second World War was an abrupt increase in the number of patients who came to the Massachusetts General Hospital from foreign lands, mostly to the Baker Memorial or Phillips House but now and again even to the open wards. This was true of all departments of the Hospital — medical, surgi-

---

*Boston Med. & Surg. Jour. *130*: 91, 1894.

cal, and special services. At first, before the war ended, they came largely from Latin America but soon they came also from Europe, Asia, Australasia, and Africa. There were, of course, two reasons for this: one was the growing world-wide fame of the institution and the other was the natural tendency for graduate students from overseas to send to us on their return home some of their more difficult cases. Among these patients there have been quite naturally men and women of national or indeed international renown in the arts and sciences, in business, and in the professions, as well as children of prominent families. Enduring friendships have resulted, linking the M.G.H. more closely still with leading citizens of many lands. This development is, of course, not unique with this Hospital, for it has been a part of the growth of a good many other institutions of the sort throughout the U. S. A., and I might add in Canada and Mexico too; but the Massachusetts General Hospital has always been one of the leaders in the acceptance of this privilege and responsibility.

The third opportunity following the Second World War that befell the M.G.H. in accentuating its international role in medicine came when members of the staff began to be invited to take part abroad in medical missions of all types and representing different specialties. These have included missions for relief, for teaching, for exchange of information, to improve diplomatic relations as in the case of Point 4, and to carry on researches often as members of international teams. Pioneering in these special missions was that of the Unitarian Service Committee Unit to Czechoslovakia in 1946. This consisted of fourteen professors in different medical fields, including Dr. Joseph Aub and me from the Massachusetts General Hospital. Later Unitarian missions included others of us, like Dr. Chester Jones. Point 4 sent me to Pakistan and India in 1952 and a somewhat similar plan to the Near East in May of 1957; an invitation from the U.S.S.R. Ministry of Health took five of us to Moscow in September of 1956 for a ten-day conference with the Russian physicians (the others in our group were Howard Rusk of New York City, Herman Hilleboe of Albany, New York State Commissioner of Health, Ancel Keys of the University of Minnesota, and James Watt, Director of the National Heart Institute of the U. S. Public Health Service).

One of the most satisfying of all my international experiences, and I am sure this can apply to others on the staff now or in the future, has been my membership in international teams carrying out medical research. For example, in 1954 I was privileged to join in a study in Naples in cardiovascular epidemiology with a few other Americans and with doctors from Sweden, Yugoslavia, and Italy; and in 1956 I was a member of a team comparing the southern Japanese living in Southern Japan with southern Japanese living in Hawaii. Such team work not only increases our medical knowledge but helps to spread it more rapidly and widely, and teaches us to speak the same language medically as well as linguistically. It also aids greatly in furthering international medical friendship.

A fourth large role internationally played by the M.G.H. has consisted of the travels abroad by many members of the staff to lecture, to advise, and to attend international and national congresses and other meetings of the medical sciences, both basic and clinical. A few of these are recorded in this NEWS sheet from time to time, but many of these contributions of our staff members are not even known to their colleagues. It would be of interest if there were a special column allocated to such international reporting which could, of course, be very brief. This would still further emphasize the current usefulness of the international role of the Hospital.

Let me cite some of these individual missions by the M.G.H. during the last decade. I would apologize herewith to senior members of our many staffs whose names may have inadvertantly been omitted.

In 1955 Dr. Nathaniel Faxon, our *Director Emeritus,* was called to Turkey to advise importantly about hospital construction and management. Dr. Dean Clark, our present General Director, went in 1954 to Alaska as member of a survey team to study health conditions, under the chairmanship of Dr. Thomas Parran; in January 1957 he was sent to Budapest by the Rockefeller Foundation, along with Dean Rusk and Dr. John Maier, to study the medical situation at the University of Budapest.

Dr. Howard Means went to Japan in 1955 to aid in the rehabilitation of St. Luke's Hospital in Tokyo. Dr. Joseph Aub has not only been a member of medical missions to Czechoslovakia and India, but he has lectured abroad in other countries. Dr. Walter Bauer served as consultant in Sweden during World War II and also served as guest professor in medicine in England recently. Dr. Chester Jones, in addition to his service as a member of Unitarian Service Committee missions in Europe in 1947 and 1948, participated in the International Congress of Internal Medicine in London in 1954, and in 1956 took part in the 10th anniversary celebration of the Hospital for Nutritional Disease of the University of Mexico. Dr. Fuller Albright in 1950 attended the Physiological Conference in Copenhagen, Denmark; in 1954 he was a guest of honor and gave the final paper at the American Endocrinological Society in Chile; he also was made Honorary Professor by the San Marcos University in Lima, Peru. Dr. Howard Sprague has addressed several world and continental congresses of cardiology in Europe and Latin America since the first one in Mexico ten years ago. Dr. Edward F. Bland was Overseas Consultant for the Surgeon General of the U. S. Army in the European Theatre in June 1949 and again in February 1952; he was co-author of a paper presented at the First International Cardiac Congress in Paris in September 1950; he presented a paper at the First International Conference on Thrombosis and Embolism in Basel, Switzerland, in July of 1954, and in September of that year he presented papers at the Second International Cardiac Congress in Washington, D.C.; in May of 1956 he was an invited guest and a participant in the First International Symposium on Rheumatic Fever at the National Institute of Cardiology in Mexico City. Dr. Bland has sent me the following note: "In the over-all cardiac training program at the Massachusetts General Hospital since 1946 there have been 162 trainees, research fellows, and graduate students, of whom 76 have been from the United States and 86 from abroad. Latin America is represented by 18, Canada 12, India and Pakistan 8, Middle East and Turkey 8, Great Britain and Ireland 8, Thailand 5, Philippines 4, China 4, Formosa 2, Austria 3, Italy 3, France 2, and one each from Belgium, Switzerland, Portugal, Germany, Czechoslovakia, Greece, Iceland, New Zealand, and South Africa. This represents an impressive group and includes 5 professors of medicine from 5 different countries, 7 associate and 7 assistant professors, and a director of health (Syria). The strong bond of friendship fostered by this common interest and association has been, we hope, a source of ties which may serve to further international good will and understanding." Dr. John Stanbury gave talks in 1954 in Santiago before the Third International Endocrinological Society and also talks in Montevideo at meetings of the local Endocrine Societies; he spent most of 1955 in Europe speaking in a number of places, particularly Leiden, Brussels, Glasgow, and Helsinki, and this year in June he spoke in Leiden and Edinburgh.

Dr. Arthur Allen, in 1947 and 1950, addressed the Royal College of Surgeons of England, of which he was made an Honorary Fellow ten years ago. Dr. E. D. Churchill has on many occasions gone abroad to lecture and advise. Dr. Oliver Cope, in 1948, was representative to the International Research Council in Germany, investigating the needs of medical scientific laboratories there, and also that year he acted abroad as civilian consultant in surgery for the Surgeon General and was visiting Professor of Surgery at the Swiss universities; in 1950 he attended the Endocrine Conference at Toulouse, France, and received the degree of Doctor *honoris causa* at the University of Toulouse. Dr. Richard Sweet gave several lectures in 1954 in England. Dr. Joe Meigs also has traveled widely to give addresses in various countries in Europe and Latin America. Dr. Grantley Taylor has given lectures before the Puerto Rico Medical Society, the Academy of Surgery in Paris, the Morocco Medical Society in Casablanca, and the International Society of Surgery in Copenhagen. Dr. Robert Linton in 1953 was guest speaker before the Spanish Gastroenterological Society in Madrid, Spain;

in 1956 he addressed the Pan-American Congress of Gastroenterology in Havana, Cuba.

Dr. Raymond Adams gave a series of lectures at the National University Medical School in Bogotá, Colombia, in 1953; in 1954 he visited various neurological centers in Europe; and recently, in 1957, he has been giving a series of lectures in Rio de Janeiro. Dr. Robert Schwab has made six trips abroad during the last decade, beginning with a meeting in London in 1947 of the Federation of International Electroencephalographic Societies and continuing in later years with visits to France, Jamaica, Mexico City, Uruguay, and most recently (1957) to Germany and Belgium. Dr. James White in 1950 gave the Rutherford-Morison Lecture at the University of Durham, England, the MacArthur Lecture at the University of Edinburgh, Scotland, and also lectures at the meeting of the British Neurological Surgeons and the Société de Chirurgie in Lyon, France; in 1953 he lectured at the International Neurological Society in Lisbon. Dr. William Sweet has visited England on several occasions; he went to Geneva as official delegate to the Atoms for Peace Conference in 1955 and lectured at seven German universities in that same field; he received the degree of Doctor of Science from Oxford University in June of this year, and was a member of the First International Congress of Neurological Sciences and Neurological Surgeons in Brussels last July. Dr. L. L. Robbins presented a paper at the 7th International Congress of Radiology in 1953 in Copenhagen. Dr. Joseph Hanelin presented an exhibit at the 4th International Neuroradiology Symposium in London in 1955. Dr. Stanley Wyman made a medical visit to the Scandinavian countries in 1954. Dr. M. Schulz spent the winter and summer of 1953 and also 1955 visiting and lecturing at the principal radiotherapy centers in the Scandinavian countries, and in 1956 presented a paper before the International Club of Radiotherapists in Mexico City.

Dr. Lindemann has also made a number of visits abroad—to Copenhagen in 1948 and again in 1952, to Toronto in 1954, and to Holland, where he gave a major address at the International Congress of Psychosomatic Medicine, in 1957. Dr. F. M. Rackemann presented a paper in French at the Second European Congress of Allergy in Paris in 1950; in 1951 he attended the organizational meeting of the International Association of Allergology in Zurich, followed by addresses in Copenhagen and London; in 1956 he made medical visits to London, Paris, Holland, and Copenhagen. Dr. Chester Frazier gave lectures to the Swedish Dermatological Society in 1951, and also addressed the Tenth International Congress of Dermatology in London in 1952. Dr. Walter Lever lectured in England in 1952 at the International Congress of Dermatology, gave lectures in a postgraduate course in Munich and Berlin in 1954, and lectured in Istanbul, Beirut, and Athens in 1955; in 1956 he spoke at the Saint Louis Hospital in Paris, and in 1957 in Scandinavia.

In 1946 Dr. M. N. Smith-Petersen spent a month in Norway demonstrating his techniques in surgical operations on the hip; also in 1946 the King of Norway awarded to him the Order of Commander of St. Olav and in 1947 the Norwegian Senate conferred upon him an honorary degree; in 1949 he lectured in Brussels and in 1951 he and Dr. Otto Aufranc spoke in London at a combined meeting of orthopedic surgeons. In 1953 Dr. Aufranc visited, spoke, and demonstrated at the American University of Beirut in Lebanon and at Dhahran on the Persian Gulf; he has made a number of medical trips to various parts of Canada also. Dr. Joseph Barr in 1954 went as a member of the WHO Medical Commission to inspect hospital and medical school facilities in the Far East, particularly in Indonesia, and at present is on a medical tour to attend the meeting of the International Society of Orthopedic Surgeons in Barcelona, to visit hospitals and universities in Athens, and to give the Robert Jones Memorial Lecture before the Royal College of Surgeons in England. Dr. William A. Rogers, as Editor-in-Chief of the *Journal of Bone and Joint Surgery*, made several trips to England for conferences of the Editorial Board with representatives from many countries. Dr. Cave in 1952 and 1954 presented papers in London at joint meetings of the orthopedic surgeons and in 1956 conducted a two-day fracture course in Montreal; in 1957 he presented a paper in Honolulu. Dr. Robert Joplin in 1952 lectured at the London Hospital, and at the Royal Infirmary in Edinburgh; in 1956 he lectured at Peterborough, Ontario. Dr. Castleman has given courses in pathology in various parts of Latin America. Dr. Fritz Lipmann, our renowned biochemist, went in 1953 to Stockholm to receive the Nobel Prize.

Dr. Henry Beecher has made many lecture trips abroad in the last decade to England, Ireland, France, Scandinavia, Russia, Switzerland, and Argentina. Dr. Harriet Hardy presented papers on beryllium poisoning at the Royal Society of Medicine in London in 1950 and on lead poisoning in Naples in 1954, and in 1956 she went abroad for six months to visit various parts of Europe, Africa, and South America, largely to study the lung diseases of industry. And many others, including junior members of the staff, have gone north, south, east, and west — in fact all over the world — to attend meetings where they have read and discussed papers or have carried out some other useful errand.

The MGH nursing staff has participated in seminars on teaching and nursing service administration with the American Hospital Association, under the International Cooperation Administration. Miss Ruth Sleeper in 1955 went to Brazil, Peru, and Colombia, and in 1957 to Mexico and Cuba; she was appointed a member of the WHO Expert Panel in Nursing in 1952 and still serves on the panel, having attended conferences in Geneva in 1952 and London in 1955; she also served as Nurse Advisor to the U. S. delegation to the WHO Assembly in 1953, and since 1947 has been a member of the International Council of Nurses as Chairman of the Committee on Education. Miss Edna Lepper in 1956 was sent to Guatemala and Chile, under the International Cooperation Administration. Miss Katherine Hardiman, Supervisor of Clinical Instructions in Nursing at the M.G.H., was loaned to the Pakistan Ministry of Health from 1955 to 1957 to establish a course for "sister tutors" in Karachi.

Although the Social Service staff have not themselves traveled abroad during the last 10 years, they have been intensively busy instructing many students from other lands — especially from England, Germany, and Sweden — in the methods used at the M.G.H.

The future international role of the Massachusetts General Hospital in the further advancement of the medical sciences, in the more rapid dissemination of medical knowledge, and in the firmer establishment of medical friendships will undoubtedly surpass that of the past and of the present. The need is evident and the opportunity and obligation will continue to challenge us.

Paul D. White, M.D.,
Member of the Board of Consultation

The Board of Trustees, at their meetings on July 26 and August 16, voted:

To promote:

Howard T. Blane, Ph.D. from the position of Research Fellow in Psychiatry to that of Assistant Psychologist.

To appoint:

Dr. Roy J. Barry as Assistant in Radiology, effective January 1, 1958;

Dr. Ronald S. Cowie as Assistant Resident in Orthopedic Surgery for one year, beginning September 26;

Dr. Melvin J. Glimcher as Assistant in Orthopedic Surgery;

Dr. John H. Knowles as Chief Resident on the Medical Service for one year, beginning January 1, 1958;

Dr. Sholem Postel as Assistant in Medicine, effective July 15;

Irving Wolf, Ph.D. as Assistant Psychologist in the Department of Psychiatry for one year, beginning August 1.

At their meetings on March 20 (report delayed in reaching THE NEWS office), July 25, and August 14, the General Executive Committee voted:

To promote:

Dr. Howard S. King to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1958;

Dr. George B. Murphy, Jr., retroactively, to the position of First Assistant Resident in Surgery, as of September 1, 1956.

To change the titles of:

Dr. Alan C. Aisenberg to Clinical Assistant in Medicine, effective when he obtains a permanent Massachusetts license;

Dr. J. Malcolm McNeill from Assistant in Radiology to Clinical Fellow in Radiology until such time as he obtains his permanent license;

Dr. James F. Patterson from Clinical Associate to that of Clinical and Research Fellow in Dermatology, effective as of July 1.

To reappoint:

- James E. Anliker, Ph.D. as Research Fellow in Anesthesia for one year, beginning July 15;
- Dr. William H. Batchelor as Clinical and Research Fellow in Medicine for one year, beginning September 1;
- Dr. Arthur E. Brown as Clinical Fellow in Medicine for one year, beginning August 8;
- John H. Fessler, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;
- Heinz Kohler, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;
- Dr. Bernhard Laukenmann as Clinical Fellow in Anesthesia for one year, beginning September 7;
- Dr. Charles I. Levene as Research Fellow in Medicine for one year, beginning September 1;
- Dr. Eugene R. Nobles, Jr. as Second Assistant Resident in Surgery for one year, beginning July 1;
- Dr. Joseph R. Petranek as Clinical and Research Fellow in Medicine for one year, beginning September 1;
- Dr. Edward S. Rendall as Clinical Assistant in Medicine for one year, beginning August 1;
- Dr. Farrokh Saidi as Second Assistant Resident in Surgery for one year, beginning July 1;
- Nathan Sharon, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;
- Gene M. Smith, Ph.D. as Research Fellow in Anesthesia for one year, beginning September 1;
- Pierre J. J. Stoffyn, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;
- Dr. Taeko Sumi as Clinical and Research Fellow in Psychiatry for one year, beginning October 1;
- Zofia Tarasiejska, Ph.D. as Research Fellow in Medicine for one year, beginning September 1.

To appoint:

- Dr. Arthur F. Amick as Assistant Resident in Medicine, beginning July 1;
- Dr. Niels E. Brandstrup as Clinical and Research Fellow on the Children's Medical Service for one year, beginning July 1;
- Dr. Martin R. Coles as Clinical and Research Fellow in Psychiatry for one year, beginning August 1;
- Edwin H. Eylar, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;
- Dr. Adamandia J. Kottaki as Fellow in Anesthesia for one year, beginning January 1, 1958;
- Dr. Paul S. Kraus as Clinical Assistant in Psychiatry for one year, beginning September 1;
- Dr. Myron B. Laver as Fellow in Anesthesia, beginning July 1, 1958;
- Dr. Pierre A. Maurice as Clinical and Research Fellow in Medicine for one year, beginning September 15;
- Thomas Nussbaumer, Ph.D. as Research Fellow in Medicine for one year, beginning September 15;
- Dr. Tsutomu Oyama as Clinical and Research Fellow in Anesthesia, beginning January 1, 1958;
- Dr. Carlos Pantoja as Clinical Fellow in Medicine, beginning July 15;
- Dr. Henry J. Powsner as Research Fellow in Neurosurgery, beginning July 11;
- Dr. Adalbert F. Schubart as Clinical and Research Fellow in Medicine for one year, beginning October 1;
- Dr. Lionel A. Schwartz as Clinical Assistant in Psychiatry for one year, beginning September 1;
- Dr. George B. D. Scott as Research Fellow in Pathology for one year, beginning October 1;
- Alvin J. Simmons, Ph.D. as Research Fellow in Psychiatry for one year, beginning August 1;
- John L. Sloanaker, M.A. as Research Fellow in Psychology for one year, beginning September 1;
- Dr. Elsa W. R. Wahren as Clinical and Research Fellow in Psychiatry for one year, beginning September 1;
- Dr. Mark McN. Walter, Jr. as Clinical and Research Fellow in Psychiatry for one year, beginning August 1.

⁂

THE WILLIAM HARVEY TERCENTENARY CONGRESS

When Dr. Means accompanied me to visit you in April we accepted his suggestion that The News should have a special reporter of the William Harvey Tercentenary Congress of 1957, June 3 to June 9, in London and Folkestone. It is ten days since your reporter returned home; this account therefore lacks that very "hot-off-the-griddle" quality, but gains perhaps by the perspective of time. This delay fits appropriately with one aspect of Harvey's most important achievement — the period of about twelve or more years that elapsed between his discovery of the circulation of blood and the publication of the first printed announcement of his work in 1628. He did not know it at the time but, as he lived to the age of 79, he could afford this long delay in the prime of his life between the ages of 34 and 46. Nor was this like my delay — a mere shelving of the task. During those years he developed his theme, polished its description, benefited from friendly and unfriendly criticism at home before publishing his work in Latin for all the world to read. Nor was the delay entirely voluntary; at that time a revolutionary idea could cause its author much trouble. Galileo narrowly escaped burning at the stake for such a thing.

In 1878 the William Harvey Tercentenary Congress celebrated our hero's birth and in 1928 another William Harvey Tercentenary Congress was jubilant over the publication of *De motu cordis*. Few men who lived three hundred years ago now have homage paid to their memory with the reverence shown at this year's William Harvey Tercentenary Congress which marked his death in 1657.

The main meeting place was the Great Hall of the Royal College of Surgeons, newly reconstructed — the old building was damaged by bombs during World War II. On the first morning, June 3, sharp at 9:30, dignitaries of the Congress, attired in colourful academic robes, walked solemnly the length of the long hall to the platform where they sat for the duration of the first few papers. These dealt with historical subjects related to Harvey. Most appropriately, the first contribution was by Professor Kenneth J. Franklin of Saint Bartholomew's, and the second by Professor John Fulton of Yale University. About two years ago Fulton strongly suggested that the 1957 Tercentenary should be adorned by a new English translation of *De motu cordis*. The last had been made by Willis, the anatomist, in 1847. Sir Russel Brain, President of the Royal College of Physicians, lent a sympathetic ear, and so it came about that the College invited Kenneth Franklin to perform the task. Working at considerable sacrifice to his other activities, he finished the translation and the book appeared just before the Congress opened. The Harveian Society of London, under whose auspices the Congress was held, bought 500 copies, had them numbered, and presented each member of the Congress with a copy as a souvenir which was distributed at the official banquet. The book, which is now on sale, should find its way into the conscious mental process of every medical student in the first or second year of his course, and should be studied acutely by all men interested in the scientific method as one of the foundations of modern philosophy of science. The new translation makes better reading at present than that of 1847, and the book includes the original Latin text.

For the 1928 Tercentenary Sir Thomas Lewis and Sir Henry Dale brought out a silent, black and white film based on *De motu cordis*. For our Congress a new film was made under the auspices of the Royal College of Physicians, in colour and with sound. Sir Henry Dale appears at the beginning to give a charming and scholarly introduction. This film, though excellent, should not serve as a substitute for reading the book, but as dessert for those who have done the reading or as an appetizer for those who have not yet read *De motu cordis*. While seeing and hearing Sir Henry Dale it is interesting to have in mind that all three congresses took place during his lifetime; the 1878 Tercentenary happened when Sir Henry was plain Henry, aged 3. Sir Henry was the outstanding personality of the 1957 Tercentenary.

The main body of the program consisted of daily scientific sessions at which papers were read by eminent authorities from all parts of the world. These were grouped under general titles, "The role of the heart in the circulation"; Haemodynamics"; "Coronary circulation"; "Pulmonary circulation"; "Results of cardiac surgery"; "Cerebral circulation"; "Splanchnic circulation"; "Peripheral circulation". In addition, on one day, a second ring was added: The Cardiac Society of Great Britain and Northern Ireland held a one-day meeting at which twelve interesting papers, mainly on Clinical Cardiology, were presented. A "first" in medical history took place on the afternoon of June 5, when, by trans-Atlantic telephone, a British-American panel discussed the results of cardiac surgery. In New York, at a session of the American Medical Association, de Bakey, Blalock, Gibson, Gerode, and Burch faced an audience of perhaps 3,000 and in the Great Hall of the Royal College of Surgeons in London, Sir Clement Price Thomas, Sir Russel Brock, Maurice Campbell, and Professor d'Allaines of Paris had an audience of about 300. The reception of voices was as clear as though they all came from our own platform. The substance of the discussion reflected the progress of cardiac surgery during the past ten or fifteen years and revealed the close personal relationships and marked agreement of the surgeons on both sides of the Atlantic. The Smith, Kline and French Company supplied the cost of the physical facilities for this interesting event.

The London libraries and museums are rich in memorabilia of Harvey and his times; excellently designed and arranged exhibits were on view. The exceptionally fine exhibit of the Wellcome Museum included a series of editions of *De motu cordis* and also various objects which reflected the manners and methods of a physician's life in the 16th and 17th centuries. Your reporter learned that Harvey was renowned as an authority on obstetrics and gynaecology. A bivalve vaginal speculum made of iron was on view.

Unfortunately, for personal reasons I had to forego the interesting excursion to Folkestone on Saturday and Sunday in order to get home on June 7. The mayor of Folkestone entertained the Congress, and this included a dinner at which plate of Harvey's time was used. Fortunately, I had arranged to spend a few days in England before the Congress and had the pleasure of a day in Cambridge as the guest of Dr. and Mrs. Kenneth Harris of University College, London. Harris, like Harvey, had been a student at Gonville and Caius (pronounced "Keys") College, and we walked the same halls and footpaths that Harvey trod from 1593 to 1597. As coincidence would have it, Harvey graduated from Cambridge just 300 years before I was born — thus another, a personal Tercentenary.

Harold N. Segall, M.D.,
Assistant in Medicine, 1923-1924

[Dr. Segall was a Henry P. Walcott Fellow, 1922-1923, studying with Dr. Means in the Thyroid Clinic, and a Dalton Scholar, 1923-1924, studying cardiology with Dr. Paul D. White. He is now Assistant Professor of Medicine, McGill University Faculty of Medicine, Montreal, Canada.—*Editor*]

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
The Anaesthesia Laboratory of the Harvard Medical School at the Massachusetts General Hospital.
Brit. J. Anaesth. 29:261-273.

Sweet, W. H.
Cerebral studies during local and general hypothermia.
In Cold injury: Transactions of the Fourth Conference, November 7, 8, and 9, 1955, Princeton, N. J., M. I. Ferrer, M.D., Editor, New York, N. Y., Josiah Macy, Jr. Foundation, pp. 329-339.

Laboratory Science

Bencze, W. L., and Schmid, K.
Determination of tyrosine and tryptophan in proteins.
Analytic. Chem. 29:1193.

Neurology, Neurosurgery, and Psychiatry

Sweet, W. H.
Formation, absorption and flow of cerebrospinal fluid.
In Modern trends in neurology, 2d series, D. Williams, Editor, London, Butterworth & Co., Ltd., pp. 29-43.

Sweet, W. H.
Surgery of the nervous system.
In Surgery: Principles and practice, J. G. Allen, H. N. Harkins, C. A. Moyer, and J. E. Rhoads, Editors, Philadelphia, J. B. Lippincott Company, pp. 1396-1445.

Sweet, W. H., and Koons, R. A.
Hypothermia and hibernation in neurosurgery.
In Clinical neurosurgery (Proceedings of the Congress of Neurological Surgeons, vol. 3, Los Angeles, California, 1955), Baltimore, The Williams & Wilkins Company, pp. 224-239.

Sweet, W. H., and McQueen, J. D.
Introduction and discussion re hypothermia and hibernation in neurosurgery.
Ibid. pp. 239-248.

Talland, G. A.
Criteria in conceptual transposition.
Am. J. Psychol. 70:263-267.

Peripheral Vascular Disease

Brown, A. E., and Learner, N.
Analysis of blood flows in digital plethysmographs.
Angiology 8:109-128.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

This new listing is to appear in THE NEWS from now on. The library call number is given, within parentheses, for each item.

Ciba Foundation Colloquia on Aging, vol. 3.
Methodology of the study of aging.
Boston, Little, Brown and Company, 1957.
(13Po)

Crosse, V. M.
The premature baby, ed. 4.
Boston, Little, Brown and Company, 1957.
(26E)

Elkinton, J. R., and Danowski, T. S.
The body fluids.
Baltimore, The Williams and Wilkins Company, 1955.
(14J)

Friedberg, C. K.
Diseases of the heart, ed. 2.
Philadelphia, W. B. Saunders Company, 1956.
(15E)

Henry Ford Hospital International Symposium.
The leukemias: etiology, pathophysiology and treatment.
New York, Academic Press, 1957.
(14N)

The major hospital atlas, 1958.
Columbus, Ohio, Major Hospital Atlas, Inc., 1957.
Columbus, Ohio, Major Hospital Atlas, Inc., 1957.
(39At)

Meigs, J. V., and Sturgis, S. H. (Editors)
Progress in gynecology, vol. 3.
New York, Grune & Stratton, 1957.
(24A)

National Health Education Committee, Inc.
Facts on the major killing and crippling diseases in the United States today.
New York, National Health Education Committee, Inc., 1955-57.
(8As)

Postell, W. D.
Applied medical bibliography for students.
Springfield, Ill., Charles C. Thomas, 1955.
(1B)

Society for Experimental Biology. Symposium No. 11.
The biological action of growth substances.
New York, Academic Press, 1957.

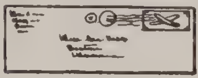
VOLUNTEER GROUPS

MGH Staff Wives Association

The first tea of the season to be given by the Staff Wives Association is planned for October 24. At that time, in addition to the foreign professional visitors to the Hospital, the Ladies' Visiting Committee will be the specially invited guests. The past presidents, Mrs. Walter Bauer, Mrs. Edward D. Churchill, and Mrs. Oliver Cope have been invited to pour.

In January a morning coffee will be held for the benefit of those members who are never free to attend the afternoon teas. The exact date will be announced later.



This letter from Dr. Wilder Tileston (*E.M.* 1900), our "singleton" in Carmel Valley, California, is much appreciated:

> Carmel Valley is a small rural community, twelve miles inland from Carmel-by-the-Sea. It has an almost perfect climate, so that one can live outdoors the year round. We have one physician, but for six months were without any. I do not practise here.
>
> I left Boston in 1909 to join the staff of the Yale Medical School, and taught there part-time till 1946. In 1952 I retired and, with my wife, traveled around the world for a year.
>
> Here in Carmel Valley my time is occupied with gardening and social activities. We have many friends, retired like myself, including Army and Navy officers, diplomats, engineers, and others. I belong to the local Kiwanis Club, of which I am secretary.

Dr. Means received this letter from Dr. Isaac M. Taylor (*M.* 1946), written from the University of North Carolina School of Medicine last June:

> We departed from the Antarctic in the middle of February; went to Auckland, New Zealand, for 4 days; then to Sydney, Australia, for 4 days; and from Sydney straight across the Pacific in a 19-day passage to San Diego. The long trip was pleasant enough but, of course, all of us who had spent the winter in the Antarctic were anxious to get home and were somewhat unappreciative of the extended cruise and route.
>
> Two days after arriving in San Diego I was discharged from the Navy and flew to Washington, where Trudie met me. We came on home and arrived in Chapel Hill the next morning, where the children, if not recognizing me, at least acknowledged me and completed our reunion. You can't imagine the joy it

No. 69 in a series of Staff photographs
Dr. Paul D. White, member of the Board of Consultation — with Dr. Yang Wang, the first Paul D. White Clinical Fellow in Cardiology at M.G.H., sponsored by the Massachusetts Heart Association

is to be at home again. Trudie and I took a number of short trips during the month of April, and I went back to work here at the hospital on the 1st of May. I started visiting on the wards right away and have learned a good deal already. At first the only thing I was able to do was to comment on the presence or absence of frostbite in the patients I saw. I have been in considerable local demand as an after-dinner speaker, giving an illustrated travel log of my journeys.

All your old friends here seem well and happy. I am impressed with the amount of progress our school and hospital have made during the two years I have been away. We have a going concern now, with many patients and much research activity. Chuck [Charles H. Burnett, c.r.p. 1946] has been wonderful to me and is letting me get accustomed to civilian hospital work at my own pace. I expect to make application for some research funds soon, and hope by the first of the year to be back at work investigating the exchange of ions, particularly potassium, across cell membranes.

Brief bits:—

Dr. Norman W. Andrew (r.p. *An.* 1956) became Anesthesiologist-in-Chief at the Mary Imogene Bassett Hospital in Cooperstown, N. Y., on August 1.

Dr. Mary A. B. Brazier was an invited speaker at two international meetings in Europe this summer. The first was a Symposium on the History and Philosophy of Knowledge of the Brain and its Functions, held in London. Her subject was "Development of the concepts relating to the electrical activity of the nervous system". The second was the International Congress of Neurological Sciences held in Brussels, where her subject was "Some advances in basic neurophysiology, and their implications for studies of the anesthetic state". At the First International Congress of Neurological Sciences, Dr. Brazier was elected Secretary-General of the International Federation of Societies for Electroencephalography and Clinical Neurophysiology.

Dr. Earle M. Chapman represented the Harvard Medical School at the Conference on Experiments in Medical Education as they Pertain to Cardiovascular Disease, sponsored by the U.S.P.H.S., in Sun Valley, Idaho, on June 8 and 9. At the Inter-American Symposium on the Peaceful Application of Nuclear Energy, held at Brookhaven, Long Island, May 13-17, he presented a paper on "The use of I^{131}" before the group and took part in group discussions. Dr. Chapman has been appointed Chairman of the Isotopes Committee at the Hospital for 1957-1958.

Dr. Erich Lindemann attended the meetings of the International Congress on Psychiatry, held in Zurich, Switzerland, September 1-9.

New addresses:—

Dr. Hedda Acs (res. fel. *C.M.* 1957), Rockefeller Institute for Medical Research, 66th St. & York Ave., New York 21, N. Y.

Dr. William R. Buchanan, Jr. (*C.M.* 1955), 56 High St., Greenfield, Mass.

Dr. Walter C. Cotter (r.s. *N.S.* 1956 & r.p. *N.P.* 1957), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. Reynout Donner (a.r.p. *Path.* 1957), Dept. of Pathology, Pr. Hendriklaan 27, Amsterdam, Holland

Dr. Alfred L. Duncombe (*E.M.* 1934), 336 Pleasant St., Brockton, Mass.

Dr. Felix G. Freund (clin. fel. *An.* 1957), Barnes Hospital, 600 S. Kingshighway, St. Louis, Mo.

Dr. Lester H. Grant (a.r.p. 1957), Veterans Administration Hospital, W. Roxbury, Mass.

Dr. John M. Head (*S.* 1951), c/o Dr. Richard H. Sweet, 87 Chestnut St., Boston, Mass.

Dr. Herbert E. Kaufman (*M.* 1957), National Institutes of Health, Bethesda, Md.

Dr. Herbert L. Kraut (a.r.p. *D.* 1957), St. Luke's Hospital, 421 W. 113th St., New York 25, N. Y.

Dr. Philip H. Leiderman (r.p. *Psychiat.* 1957), Boston City Hospital, Boston, Mass.

Dr. Harold L. May (*S.* 1954), Massachusetts General Hospital, Fruit St., Boston 14, Mass.

Dr. George B. Murphy, Jr. (*S.* 1952), Gundersen Clinic, La Crosse, Wis.

Dr. Austin F. O'Malley (a.r.s. *U.* 1957), Veterans Administration Hospital, 150 S. Huntington Ave., Jamaica Plain, Mass.

Dr. Renée B. O'Sullivan (*C.M.* 1957), Children's Medical Center, 300 Longwood Ave., Boston, Mass.

Dr. Geraldine M. Peiffer (a.r.p. *An.* 1957), St. Margaret Hospital, Hammond, Ind.

Dr. James A. Pittman, Jr. (*M.* 1953), University of Alabama Medical Center, Birmingham 3, Ala.

Dr. Guillermo C. Sanchez (*M.* 1950), 330 Dartmouth St., Boston, Mass.

Dr. Arthur A. Sasahara (a.r.p. 1957), Veterans Administration Hospital, W. Roxbury, Mass.

Dr. Samuel J. Sunnenblick (gr. stud. a. *S.* 1956), 19 Pleasant St., Portsmouth, N. H.

Benjamin E. Volcani, Ph.D. (res. fel. *Biochem.* 1957), Dept. of Chemistry, University of California, Berkeley, Calif.

This letter has come to Dr. Clark from a recent patient who lives in Cambridge. He writes:

From May 26 to June 8 I occupied a room in the Phillips House. On May 27 Dr. Grantley Taylor operated on my mouth to remove a cancer. As you know, this operation results in several days of pain for the patient.

I write to thank you warmly for the splendid care I received from everyone for the whole time of my visit to your Hospital. Mrs. Moran and her staff did everything possible to help me and, in spite of being hard worked, they managed to make it seem as though each thing was a pleasure to do.

Eating is particularly tiresome after this operation. Your Dietary Department took no end of trouble to contrive food that I could swallow and which was also pleasant to eat. In spite of the pain, my dominant impression is of the skill and kindness of everyone concerned.

I would like to comment on one excellent feature of my treatment in Phillips House. I arrived in the afternoon of the day before the operation. Everyone involved came to call on me to make himself known—Dr. Judson G. Randolph (the resident), Dr. William P. Rogers, Jr. (Dr. Taylor's assistant), and several nurses; also, the doctor who gave the anesthetic. Each one gave me a careful description of exactly what was to be done with me in the way of tests, etc., just *when* each thing would be done, and the process involved. Dr. Taylor had already described the nature of the operation and the job of recovery afterward.

The result was that I was never left guessing for an instant. I knew exactly when and how each procedure was to take place. I think this contributed greatly to a relaxed frame of mind during the hours before the operation.

THE MASSACHUSETTS GENERAL HOSPITAL 1811 NEWS

No. 171 Boston, Mass November 1957

PORTRAIT OF AN OPHTHALMOLOGIST:

FREDERICK HERMAN VERHOEFF, M.D.

Among the best known of the world's ophthalmologists is the *doyen* of the ophthalmic staff of the Massachusetts Eye & Ear Infirmary — a positive and productive man who, for 57 of his 83 years, has been intent on utilizing his every experience in the laboratory and clinic for the benefit of his specialty. A criterion of his success and influence is the national recognition that has been given to him. In 1922 the Section on Ophthalmology of the American Medical Association awarded him the Hermann Knapp Medal, and in 1930 the American Medical Association again honored him with its Ophthalmic Research Medal. In 1932 he received the Lucien Howe Medal of the American Ophthalmological Society. A fellow ophthalmologist, Professor *Emeritus* Alan C. Woods, M.D. of Johns Hopkins's Wilmer Institute, said of him ". . . he was much of a lone voice crying in the wilderness, but the example of his small laboratory, and the research contributions therefrom, made their mark on American ophthalmology and awakened ophthalmologists. . . ."

In 1900, when Frederick Verhoeff accepted the post of resident pathologist at the Eye and Ear, he was truly a "lone voice". No other special hospital in America had such a position and there were many in conservative Boston who did not welcome the idea. Nor was the man himself universally welcomed. It seemed to many that he often deliberately complicated his position by his uncompromising and undiplomatic attitude toward his hospital superiors. At the root of this pattern of behavior was a vision of having a fully equipped, liberally endowed, and professionally staffed ophthalmic research laboratory. No one shared this vision. He had to wait for over 30 years for the dream to come true.

The first work area assigned to him in the Infirmary was a single room on the top floor. He was expected to do all the pathologic and bacteriologic work, perform autopsies, and even do the urinalyses for the 160-bed hospital. For an assistant he had a part-time orderly. His major laboratory equipment consisted of an inferior microscope, a microtome, autopsy instruments, an incubator, and an oven. His total salary was $650 — $400 a year from the Infirmary and $250 a year from Harvard as an instructor.

But the citadel of Boston conservatism slowly crumbled under the stubborn assaults of this third generation Dutchman from Kentucky. He more than proved his worth to the hospital, for 7 years after his arrival in Boston the Infirmary built to his plans a pathology building and a year later he was assigned his first technician. From this laboratory the papers and reports began to pour out. Often there were as many as 6, 7, or 8 papers a year bearing the name of Frederick H. Verhoeff as author or co-author and the Massachusetts Eye & Ear Infirmary as the sponsoring institution.

The total literary production of his professional life to date is 216 papers. There is little in these papers that can be termed repetitious. True, he does deal with the same subject in several different papers over the years, but each paper reflects a growth in his thought on a problem rather than a rehash of old material. By beginning with the first of his 39 papers on optics and vision, and reading through to the last, it is possible to watch the development and enlargement of a unique mind—a mind capable of accepting, rejecting, and utilizing the fruits of experience. There has never been anything static in the mental make-up of Frederick Herman Verhoeff.

Had he been content to concern himself with only optics and vision he would have been assured more than just a small measure of fame. However, his interests were broader and included all aspects of ophthalmology. A classified list of his writings proves this point. In addition to the 39 papers on optics and vision, he has been the author or co-author of 24 papers on bacteriology of the eye, 37 papers on ocular surgery, 35 papers on diseases of and injuries to the eye, 75 papers on ocular pathology, and 6 papers of general or historical nature. At present he is at work on his 217th paper. He has never written a textbook, but his collected reprints fill 5 volumes.

The influence Verhoeff effects on ophthalmology by his writings is great, but still greater is the influence he has had on his colleagues and students. He is a member of all the national ophthalmological societies, and regularly attends their meetings. Frequently he presents a paper. Always he has some comment to make on the papers presented by others. He never argues for the sake of argument nor deals in empty platitudes and compliments for the sake of politeness. However, his words are always to the point and sharp — often so sharp that he wounds the sensibilities of the speaker. To Verhoeff a paper presented before a meeting is something almost sacrosanct; it is never an excuse for parading an ego. That his anticipated presence at a meeting might cause some shallow soul to withdraw a paper is a fair guess to make. If so, the meetings of the various societies are the better for it.

To have been a co-worker with or student of Verhoeff is an experience never to be forgotten. The investigator — and there have been many, many of them since 1900 — learns more than just a few facts concerning ophthalmology. He learns to question and then question again his findings, because if he doesn't Verhoeff will. He learns to read and read again all the literature on the subject, because if he doesn't Verhoeff will demand it of him. He learns to write succinctly, because that is the way Verhoeff wants it done. And he learns he is capable of great anger, because Verhoeff brings it out of him. When these red clouds pass away the student or co-worker finds that he has gained in wisdom and is a better ophthalmologist, because Verhoeff made him so. It is no exaggeration to say that the work of Verhoeff-trained men can always be detected. Somehow, the lessons learned by them in the Old Path Lab and in the new Howe Lab under Verhoeff's tutelage have never been forgotten.

It is something of a ritual among the staff and alumni of the Eye & Ear to tell tall tales about "Freddie". When all these tales are told — all the tales of his alleged vanity, of his reputed testiness, of his prolific output, of his fabulous memory, of his fights for his principles and ideas, of his personal habits, and of how he has mellowed with the years — when all these are told, there is invariably a truthful summing up of the man. This can be briefly stated. Frederick Herman Verhoeff is a genuinely modest and generous man. Generously has he enriched the professional lives of the men he has come in contact with, generously has he enriched the institution he has been devoted to for 57 years, and generously has he enriched his chosen specialty — perhaps more than any other man of his generation.

Anon.

* * *

Dr. Milford D. Schulz was named President-elect of the American Radium Society at its 39th annual meeting, held in Quebec, Canada, last June.

Contributions to The News in the amount of $594.60, over and above subscription fees, were received during the fiscal year 1956-1957. This exceeds any previous yearly contribution figure by several dollars. A note of appreciation is always sent to each contributor, but The News takes this opportunity to express publicly its thanks for such generosity from so many of its readers.

GRACE WHITING MYERS

My acquaintance with Mrs. Grace Whiting Myers began in 1905, when, as a newly appointed House Officer to the South Surgical Service of the Massachusetts General Hospital, I had to go to the Record Room to abstract the record of a patient who had re-entered the Hospital. Records were then kept in bound volumes in the Treadwell Library, which occupied the entire second floor of the central section of the Bulfinch Building — now the Medical Staff Room with its adjoining classrooms. In the center of the main room was a large mahogany table, with chairs formally grouped around it. A small room on the north side was the Record Room, where Mrs. Myers had her desk; and alcoves, also to the north, held the stacks for books and records.

I had been warned that Mrs. Myers was an exacting person regarding records, that she allowed no frivolity, required correct deportment, and was, if these amenities were observed, a very pleasant person. My entry into the Treadwell under these restrictions was made with some trepidation, but it marked the beginning of a friendship that lasted for 52 years and my acquaintance with one of the finest women it has been my good fortune to know.

Mrs. Myers was always neatly dressed, always polite. She was meticulous and orderly in her work, exacting of others and of herself, intolerant of poor work or procrastination, proud of her records and of her Hospital — a lady of the old school, beloved and respected by all who knew her. Her handwriting was neat, with every letter perfectly formed and as legible as if typed — an example to all, but followed by few Staff members or House Officers. In spite of her desire for more legible records, when it was suggested that typewriters be furnished to the House Officers, Mrs. Myers was alarmed because, as she said, "they spell so horribly."

On one occasion a jovial Staff member ventured to tell her a story which he thought was innocuous, although it did have a slight *double entendre,* whereupon he was banished from Treadwell Library and was told, "Don't you ever come back until you have apologized." He fled in haste, but finally mustered courage to return and say he was sorry, intended no wrong, and was forgiven.

Grace Whiting Myers was born in Worcester, Massachusetts, on November 14, 1859, and died at McLean Hospital on August 20, 1957, at the age of 97. She has told the story of her life in a delightful autobiography published in 1948, so I shall set down here only the part that deals with the Massachusetts General Hospital and our records.

Mrs. Myers was appointed Assistant Librarian to the Treadwell Library in 1897 and a few weeks later was told that, as "Keeper of the Records", the care of records was also part of her responsibility. Although the Staff of the M.G.H. had been particular about records and had preserved a perfect file from the opening of the Hospital, the registering, cataloguing, and filing of records and other statistics were elementary compared with what is now required. Therefore, Mrs. Myers had to feel her way and to play her part in the development of a modern Record Room. It is hard to believe that her first compilation of medical and surgical statistics prepared two months after her appointment was, according to her own statement, pronounced by the Record Committee as "too bad to be published."

Mrs. Myers's work was her life, and she was always seeking ways to improve the Library and the Records. Up to the time of her appointment, there had been only a disease catalogue. Mrs. Myers started a diagnosis catalogue and a name catalogue. She notes that: "Previously the only means of locating a re-entry was through the Admission File in the General Office [kept in a huge book, one line to each patient], then going to the Record Room and hunting it up by Service and date."

Only the members of the Medical Staff were allowed to enter the Treadwell Library in the morning. House Officers were privileged to read in the Library during the afternoon and evening, but on no account to remove a book or journal from the room. The Staff often held an evening meeting, following which a supper was served in the Library. Mrs. Myers's sense of order and neatness was upset by the litter that was usually left. One morning, after finding several leather-bound books badly soiled by salad dressing, she wrathfully demanded of Dr. Howard, Director of M.G.H. at that time, that there be no more suppers in the Library. And that was that. This was typical. She had perfect timing.

In 1909 she became Librarian and Record Librarian with 7 assistants. After 12 years, the importance of records had grown so that 8 people were required, instead of the 1 in 1897, to handle the work in the Department. Other hospitals were having Record trouble, so in 1912 the Record Clerks of the Boston hospitals began to hold informal meetings to discuss their problems — meetings which ultimately led to the formation of the American Association of Medical Record Librarians in 1928. One of the results of these meetings was the compilation and publication of the *Boston hospitals nomenclature of diseases,* later to become the *Massachusetts General Hospital classification,* which was widely used by hospitals throughout the country. After going through 9 editions, it was replaced by the present *Standard nomenclature.* Mrs. Myers superintended the compilation of the 9 editions of the MGH classification.

When World War I came, Mrs. Myers, prepared by her experience in the Spanish-American War with Government requirements for soldiers' records, was ready with duplicate cards bearing all the necessary data. Her bulletins on "The medical and surgical aspects of the war", compiled from periodicals current at the time, came to the attention of the Surgeon General of the United States Army, who requested that copies be sent to Red Cross Headquarters, there to be mimeographed and distributed to all camps and cantonments.

In 1916 the Treadwell Library and the House Records were moved to the new Moseley Building.

The first Record Librarian pupil came to Mrs. Myers in 1917, thus initiating instruction of Medical Record Librarians. The efforts of the American College of Surgeons to improve hospital records through its program of inspection and accreditation, begun in 1918, received full support and assistance from Mrs. Myers.

In 1925, after 27 years of service, Mrs. Myers resigned. She was then 66 years old. Miss Carrie L. Williams became Treadwell Librarian and Mrs. Genevieve Chase was appointed Record Librarian, separating the positions previously held by Mrs. Myers which had become too arduous for one person to carry.

Retirement did not mean inactivity for Mrs. Myers. By 1928 she had completed her *History of the Massachusetts General Hospital, 1872-1900,* a continuation of the previous histories. Then in 1928 came the meeting of the American College of Surgeons in Boston which featured a special Section on Records, with demonstrations and papers. This culminated in the formation of the American Association of Medical Record Librarians and the election of Mrs. Myers as its first president. With the inauguration of the Massachusetts State Association of Record Librarians she was elected president and served for 37 years. Other forces helped to make Records important, but Mrs. Myers by her personality, ability, energy, and example was instrumental in raising a neglected and formerly insignificant clerical job to a position of standing and respectability. As long as her health permitted she attended various meetings and was always the recipient of respect and admiration.

From 1930 to 1948 she buried herself in church work and in the writing of numerous short books and articles. *Notes of triumph,* planned to be given to members of the 6th General Hospital (the Massachusetts General Unit in World War II), was later published by Congregational House of New York and over 5,000 copies were distributed. Her hands were as busy as her mind, and during the war years she knitted 58 pairs of long sea boot stockings.

Troubled with failing eyesight, she nevertheless retained her interest in world and local affairs with a buoyant spirit, and cheerfully received her friends in her pleasant room in a nursing home in Newton Highlands. Slowly both physical and mental powers grew dim and on October 10, 1952 she entered McLean, where a grateful Hospital cared for her until her death on August 20, 1957.

N. W. F.

[Nathaniel W. Faxon, M.D

The Board of Trustees, at their meetings on September 6 and 20, voted:

That Dr. Mahlon B. Hoagland be granted leave of absence for one year, beginning September 1;

To accept the resignation of Dr. John J. Lorentz from the position of Assistant in

Physical Medicine, effective September 30;
To accept with regret the resignation of Dr. A. Gedeon Matoltsy from the position of Associate Biologist;
To accept with regret the resignation of Dr. Victor A. Politano from the position of Assistant Urologist, effective September 30.

To change the titles of:

Dr. Jacob Christ from Clinical Assistant to Assistant in Psychiatry at McLean Hospital;
Dr. Stephen L. Washburn from Resident to Assistant in Psychiatry at McLean Hospital.

To appoint:

Dr. Fairfield Goodale, Jr. as Assistant in Pathology, effective July 21;
Dr. Clement A. Hiebert as Resident in Surgery, beginning September 1;
Dr. John W. Raker as Assistant Surgeon, effective as of August 21, and to allot him space in the Warren Building;
Dr. Norman T. Smith as Assistant Resident in Anesthesia, beginning July 1, 1958.

At their meetings during September, the General Executive Committee voted:

To conclude the appointments of:

Dr. Edgar L. Gasteiger, Jr. as Associate Physiologist in Neurosurgery, as of August 31;
Renee G. Naves, Ph.D. as Research Fellow in Medicine, as of September 15;
William S. Quigley, B. S. as Research Fellow in Physics (Medicine), as of September 20.

To promote:

Dr. Ralph C. Darling, Jr. from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 1;
Dr. John A. Mannick from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning October 1;
Dr. Edwin W. Salzman from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning October 1;
Dr. George D. Zuidema from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning November 1.

To reappoint:

Dr. Luis L. de Mola as Graduate Student Assistant and Clinical Fellow in Pathology, for the period November 1, 1957 through June 30, 1958;
Dr. Susanne J. Lamdin as Assistant Resident in Anesthesia for one year, beginning September 20;
Dr. Ingrid Sondergaard as Clinical and Research Fellow in Psychiatry for one year, beginning October 1;
Dr. James L. Vanderveen as Clinical Fellow in Anesthesia for one year, beginning October 1.

To extend the appointment of:

Dr. Gilles G. C. Lyon as Clinical and Research Fellow in Neurology, from October 1, 1957 through March 31, 1958.

To appoint:

Dr. Jean N. Angelo as Research Fellow in Neurology for one year, beginning January 1, 1958;
Fred E. Bell, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;
Dr. Margit M. Bellman as Clinical Fellow in Psychiatry for one year, beginning September 3;
Dr. Clive B. Cameron as Research Fellow in Medicine for one year, beginning September 1;
Dr. Hans J. Eberlein as Fellow in Anesthesia for one year, beginning October 1;
Dr. Frank R. Ervin as Clinical Fellow in Psychiatry for one year, beginning September 15;
Dr. Edward Gitsch as Clinical Fellow in Surgery, assigned to Gynecology, for the period August 21 through December 21;
Dr. Derek S. Gordon as Clinical and Research Fellow in Neurosurgery for one year, beginning October 1;
Dr. John M. Head as Clinical Assistant in Surgery;
Sylvia F. Jackson, Ph.D. as Research Fellow in Medicine, beginning October 1;
Gillray Kandel, B.S. as Research Fellow in Psychology, in the Department of Anesthesia, beginning October 1;
Richard R. Kelley, B.A. as Research Fellow in Pathology for one year, beginning September 1;
Dr. Betty S. Roof as Clinical and Research Fellow in Pathology for one year, beginning September 1, to work with Dr. Aub;
Leslie F. Smith, Ph.D. as Research Fellow in Medicine for one year, beginning October 1;
Elizabeth M. Sparrow, Ph.D. as Research Fellow in Medicine for one year, beginning September 1;
Dr. Henry deF. Webster as Clinical and Research Fellow in Neurology for one year, beginning October 1.

* * *

In the summer of 1955 the late Professor of Neurology at the University of California, Robert Wartenburg, asked me to write a review article on myasthenia gravis, which he published. At his suggestion the *Deutsche Medizinische Wochenschrift* was given a direct translation of this and it appeared in November of that year. This resulted in an invitation from the Editor-in-Chief, Professor Heinz Kobcke of the University of Munich, to come there and give a lecture or two on this subject. Following this invitation, which was supplemented by one from the Chief of the Neurological Department, Professor Kurt Kolle, a Fulbright lectureship as a Visiting Professor for 4 months in 1957 was secured. I was strongly advised to give these lectures in German, if possible, and planned to have them written out first in straight short English sentences and to have a German secretary in Boston translate them literally into German sentences of equal brevity and clarity. By doing this the long cumbersome elaborate German sentences, with a couple of verbs tacked on at the end, would be avoided and, with my limited German, I would have a reasonable chance of reading them in an intelligent way before the students and staff of the University of Munich. The lectures were prepared in this manner, covering problems in the treatment and diagnosis of epilepsy, Parkinson's disease, and myasthenia gravis, and were sent to Professors Kobcke and Kolle.

We arrived in Munich in the early part of April of this year, at a time when the Medical School was on vacation. I was cheerfully informed that my lectures were excellent but the style of the German was not good enough for presentation and that they were being *"slightly"* modified to conform with better German habit. When I received them I was saddened to see that my short, carefully planned German sentences had been transformed into beautifully long, elaborate ones with the collection of verbs at the ends. I had nothing to do but to struggle with this arrangement.

The first lecture on Parkinson's disease was called for as an emergency measure by Professor Kolle when he was unable to give his lecture before the 400 students because of an acute laryngitis. The necessary rehearsals were not possible since the order of the presentations was changed. In the middle of this lecture I found a very brief sentence that had for some reason been spared by the professorial editing and I was able to say in German that this kind of German I liked more than anything else. This brought a loud burst of laughter from the student body and a stamping of feet that indicated approval. Nine lectures were given in German and one was given in English. During the last lecture there occurred a breakdown in the projection equipment and a considerable amount of freewheeling away from the text was necessary. This was really not too bad, because words I did not know were covered by English and a certain amount of gesticulation was permissible. The next day one of the staff members delicately commented that the extemporaneous part of the lecture, with the full use of my expressive abilities, was clearer to him and to his fellows than the formal and proper German text, which was frequently mispronounced and delivered without much expression.

We were most fortunate in living with a family whose Labrador retriever "Dusty" had whelped 7 puppies the day before we arrived. These puppies, since they lived in the garage, required the central heating for their welfare until almost the end of May. This meant that our own quarters were cozy and warm during that entire period, whereas in most houses central heating is specifically turned off about the middle of April. Our affection for these puppies was rewarded by the presentation of one of them as a farewell present which we brought back with us.

On May 6 we were invited to Berlin as guests for the "Rickfest" for the very modern international Benjamin Franklin Congress Hall built by American funds and whose architect, Hugh Stubbins of Lexington, is a friend and neighbor of mine. The trip was accomplished comfortably by air, since motor travel through the East Zone is rather hazardous for Americans. This "Rickfest" was different from any ceremony we had ever attended and explained the presence on half-built houses in Germany of small Christmas trees. When a building has had its roof completed (which used to be done by skilled ships' carpenters from seaports) the owner gives a special party for all of the workmen, their wives, and many friends. This begins with a speech by the chief carpenter, which is usually in the form of a poem, then a bottle of beer or champagne is broken on the highest beam of the building, i.e., the building is launched in a semi-nautical way, and a small Christmas tree or evergreen crown is hoisted solemnly to the highest point of the building and remains there until the building is completed. After the ceremony everyone goes to a nearby restaurant and feasts and drinks, with more speeches and entertainment, all on the owner, for several hours. Mr. Stubbins thought it would be nice to introduce this delightful custom to this country.

In addition to this interesting "Rickfest" we were most impressed by the sincere admiration of all the West Berlin people we met for the American airlift that kept this huge city supplied with every necessity for 18 months. This admiration extended over all West Germany and was one of the most powerful sources of cordial respect and affection toward the United States that we encountered.

Among the charms of the city of Munich to a visitor are the beautiful and clean blue streetcars. Not only are they pleasant to look at because of this light color, but both my wife and I were astounded by their quietness in operation. Several inquiries to my medical friends regarding this produced such absurd explanations that I realized further investigation was necessary. Furthermore, as these quiet cars went around curves it was obvious that the 3 single pairs of wheels articulated in some mysterious manner. Again, my medical friends had no satisfactory explanations, and indeed one suggested that it was an optical illusion. The matter came to a head about 10 days before we left in July, when a single streetcar was coming down the track with its nose definitely down as if it were sniffing the rails. As it came close one could see that the front platform contained about 20 uniformed motormen. There was no one else in the car and it carried a big sign reading "Fahrschule" (School Car). When we commented on this to our Munich hostess with whom we lived, she suggested that since her late husband had been an important member of the civil government, she could arrange for an interview with the head of the streetcar company where I could discuss details of this fascinating School. The appointment was made for 2 P.M. on one of the hottest days of the heat wave. First, the silence of the streetcars was explained by the consulting engineer, who was most pleased to have a visit from an American professor. The silence was due to the presence of 1½ inches of rubber tire between the two middle parts of the wheels. The other factor was that of the articulation of single wheels by means of a patented hinge arrangement under the car which the engineer demonstrated neatly on a model which was on his office desk. Then I was escorted to the School where motormen were being instructed in how to drive and operate the streetcars. He explained that in 33 days of schooling the pupils could be taught enough to take the streetcars into the maze of automobiles and bicycle traffic. They had a whole series of very interesting tests that such candidates had to pass before they were allowed to operate the cars. One of these, running for 7 minutes, involved the control of a model streetcar on a track while all sorts of traffic approached it from both sides. In my own effort (perhaps because of the heat) I had 9 collisions in 2 minutes and I was permanently disqualified from ever becoming a motorman in Munich. The second test involved a series of reaction times to 4 lights on the wall involving keys under each hand and each foot, all of which was worked on a moving paper for 7 minutes. It was so beautifully suited to our clinical investigation of Parkinson's disease that I made arrangements for the neurological associate in charge of the Nervenklinik in Munich to come over to the streetcar company to test his patients. We are planning to build such a unit in our own laboratory for such purposes.

The Professor in saying farewell to me commented on the fact that his clinic had never before been aware of this careful examination of the streetcar motormen in the School across the river, and he felt that one of the successes of the Fulbright lectureship was to bring this to his attention.

We brought back from Munich the Volkswagen which we used over there and this enabled us to attend the International Congress of the Neurological Sciences in Brussels — a 6-ring circus: Neurology, Electroencephalography, Neuropathology, Neuroroentgenology, and Neurosurgery, as well as the League against Epilepsy. Everybody in the neurological world seemed to be there in Brussels, and I did not meet many who were there, due to the fact that some 3,000 members were present at the Congress. My trouble with projection equipment followed me to Brussels. I completed my 10-minute official discussion of Professor Granit's paper on the control of voluntary movement with special reference to Parkinson's disease in the specified 9 minutes, and then during the last minute, when a single lantern slide was requested, the bulb blew out. Since that was not my fault, the chairman let me stand and the audience waited patiently while a new bulb was obtained and inserted in the lantern. It is doubtful whether any congress of this size, with so many disciplines combined, will ever be attempted again.

One of the most interesting hospitals that I visited on my trip from Munich to Brussels was the Königin-Elena Klinik at Kassel, Germany. This 110-bed private hospital, founded by the Queen of Italy in 1933 in a large private home on lovely grounds, is devoted entirely to the treatment of patients with Parkinson's disease. It is, therefore, a unique hospital. The present director is Dr. H. P. Schulz. He stated that patients remained there about 8 weeks and every minute of their days was spent in exercise, physiotherapy, and group efforts to improve speech, motor function, walking, etc. All modern medications were used in addition, and some 70 percent of the patients there were objectively much improved when they went back to their homes. The difficulty over here is in keeping what improvement is so achieved when patients are back in their old surroundings. I was surprised when Dr. Schulz stated that about 60 percent of his patients maintained this improvement and kept in close correspondence with the clinic. Of course, the exceedingly great embarrassment that most patients with Parkinson's disease have in the presence of normals is eliminated there since everyone is in the same situation.

In conclusion, both my wife and I feel that the people of Munich were most friendly and hospitable toward Americans. The medical groups were as helpful as they could be to me with my lectures, my awkwardness with German, and in making our stay very happy and pleasant. Finally, it seemed very worth while to make the effort in giving the lectures in the native language, as judged by the favorable comments of appreciation that were received.

Robert S. Schwab, M.D.,
Neurologist

CARDIOVASCULAR RESEARCH LABORATORY

The last report from this Laboratory appeared in The News in April 1953. Since then, important changes have taken place in the Laboratory. Dr. Ivan D. Frantz, Jr., who wrote the last report, was subsequently called to the University of Minnesota as Research Professor of Medicine. This recognition is a just reward for the very excellent work Dr. Frantz was doing here, and has continued to do in Minneapolis, on the problem of atherosclerosis. Regrettably, however, it left the Hospital without a chief cardiovascular investigator, and the Laboratory was closed during 1955-56. The Laboratory site during this period was used as temporary quarters for the Dermatology Laboratories.

Last fall, when the Dermatology Laboratories moved into their present new quarters in the Warren Building, the space on the first floor of the Research Building again became available for the Cardiovascular Research Laboratory. Reestablishment of the Laboratory commenced at that time and its reorganization still continues.

With its reopening, the orientation of the Laboratory has shifted its emphasis. Our primary goal now is the elucidation of active ion transport by cells and tissues.

The major constituent of the body is water. It comprises about 60% of the weight of a normal individual, so that in an adult weighing 150 pounds it amounts to some 40 quarts or 10 gallons of water. This volume of water is distributed so that about 2/3 is contained within the cells and 1/3 makes up the fluid environment which bathes the cells — the extracellular fluid. The extracellular fluid is further compartmentalized so that about 1/3 is contained within the blood vessels and the remaining 2/3 is the immediate environment of the cells — the watery bridge which connects the cells of the body with their adjacent blood supply.

The function of the heart is to keep the extracellular fluids in continuous circulation so that the actual environment of the cells is constantly replenished. Oxygen, food stuffs, cellular building blocks, and hormones are carried to the cells in this circulating fluid which maintains a continuous shuttle system from lungs, gastrointestinal tract, liver, and endocrine glands to even the remotest cells of the body. Waste products leaving the cells are picked up by this circulating extracellular fluid and removed by the kidneys which, in addition, maintain within narrow limits the amount of water and salts in the body.

One of the problems which has intrigued investigators for many years is the curious distribution of salts between the fluid inside the cells and the fluid bathing the cells. The intracellular fluids contain largely salts of potassium, while the extracellular fluids contain almost exclusively sodium salts. How this separation is maintained is the central problem of our present investigation.

When a cell dies it loses its ability to accumulate potassium and exclude sodium so that these two ions then distribute themselves equally on either side of the cell membrane. Thus this ion distribution is closely related to the life process. We know that cells maintain their volumes by means of these ion distributions. We know that the energy stored in this distribution of salts is utilized for nervous conduction. We know that several enzyme systems within the cells are dependent for their normal function upon the presence of critical concentrations of ions. We know that major functions of the kidney, stomach, and gut are related to their ability to selectively transport ions.

It is not surprising, perhaps, that in disease such a ubiquitous and important function of cells may become disturbed. Abnormal distributions and concentrations occur in some illnesses and these abnormalities further disturb cellular function and health. We know that certain specific disturbances in renal handling of sodium can produce hypertension, and some workers feel that all types of hypertension have a disturbance in sodium distribution as their basis. With failure of the heart, excessive quantities of water are retained, resulting in edema or dropsy. This fluid accumulation is secondary to retention of sodium by the kidney. Abnormalities of sodium and potassium distribution occur in the failing heart muscle itself, and the beneficial action of digitalis and other heart medicines is related to their ability to correct this abnormal distribution of salts. It was, in fact, the disturbances in salt distribution associated with heart failure that stimulated our present interest in how the normal distribution of ions is maintained.

At the present time we know that energy liberated by the cells in the metabolism of food stuffs is utilized to operate the ion pumps. This energy is first stored in that ubiquitous cellular currency of energy — adenosine triphosphate, ATP. What we seek to learn is the nature of the ion pump and how the energy stored in ATP is used to make the pump work.

In this first year of reorganization the work in the Laboratory has been greatly aided by the association of Drs. John Anderson and Lot B. Page. Dr. LeRoy Maffly has just arrived to replace Dr. Anderson, who is returning to Newcastle-upon-Tyne, England, where he will continue to pursue his interest in ions at the medical school there.

To broaden the base of research in this Laboratory we are currently seeking a suitable investigator with a primary interest in atherosclerosis research to add to the group. This is the field of study seeking to learn the causes and prevention of arteriosclerosis. My predecessor, Dr. Frantz, worked here in that field, and because of its great importance we hope to continue work in this direction in the Laboratory.

In the past year a very generous gift was made to the Hospital by the John A. Hartford Foundation, Inc. for the support of the Cardiovascular Research Laboratory. We are indebted also to the American Heart Association and the United States Public Health Service for assistance.

The Cardiovascular Research Laboratory is very much a youngster in the illustrious laboratory family of the Massachusetts General Hospital. We hope it will grow rapidly, nurtured in such a favorable environment, to contribute significantly to the knowledge and teaching of medicine.

Alexander Leaf, M.D.,
Assistant Physician
and *Chief Cardiovascular Investigator*

VOLUNTEER GROUPS

MGH Staff Wives Association

Of particular enjoyment to MGH patients are the Chapel concerts, sponsored by the Staff Wives Association, at which a member of the Hospital family is the performing artist. At the first concert this season, held on October 23, Miss Adele Khoury, secretary in the Anesthesia Department, was the contralto soloist; and Mrs. Milford D. Schulz, wife of our well-known radiologist, gave an organ recital on November 6. At the third concert two young students from the New England Conservatory — Miss Elizabeth Sheerin, soprano, and Miss Mary Macauley Monks (daughter of the late Dr. John P. Monks and Mrs. Monks), alto, will provide pleasure for the patients with a program of duets and solos.

As we report these concerts which add so much to the trying days of some of our long-term patients, we wish to enter a plea which we hope may reach the eyes or ears of some generous person. The Chapel piano is in a hopeless condition, and a GOOD UPRIGHT, worthy of our concert pianists, *must* be found. If anyone can assist the Staff Wives Association in this project, please call or write Mrs. John D. Crawford, Old Concord Road, Lincoln (telephone number CL9-8323), or the Staff Wives Reception Center, Extension 2366.

Distaff Club

Our first official meeting of the year was held on September 26 in the Penthouse. It was a most enjoyable get-together. The highlights of the meeting were a talk by Dr. Dean Clark, orienting us to the Hospital, and a tour of the institution conducted by Mrs. Soma Weiss. The program was particularly helpful to the newcomers and provided a pleasant review for the other members. The hostess for this meeting was Mrs. Bob Bullwinkel.

Our next affair was a Barn Dance, held in Concord on October 26. Plans were under the supervision of Mrs. Alfred Miller. The dance was open not only to Distaff members and their husbands, but also to all their friends. There was an admission charge for members, but guests were admitted free. It was a most enjoyable evening for all who came.

Preliminary work for the annual Massachusetts General Dance is already under way by the co-chairmen: Mrs. John Lewis, Jr. and Mrs. Bruce Sams, Jr. In order to make this major undertaking a success, it is essential to begin planning now. Committee members are being chosen from the Staff Wives Association and the Distaff Club to work on the many details that such a gala event involves.

Ladies' Visiting Committee

More than 80 members of the Hospital family and Ladies' Visiting Committee attended a morning coffee party in Baker on October 1. The event was in honor of Mrs. Alice Burnell who has retired after 15 years as manager of the General Store, which is under the auspices of the Ladies' Visiting Committee for the benefit of the Hospital. Mrs. Burnell is leaving Boston to make her home in Florida.

Mrs. Carl Warton, who has also been with the Store for many years, will replace Mrs. Burnell; and Miss Margaret Powers, a former ward secretary, will assist her.

The Committee is delighted to announce that the General Store is to be drastically renovated, with a new decorative scheme and equipped with more modern fixtures. During its existence, the Store has made a real place for itself, not only on account of the variety of its "small wares" but also on account of its cheerful atmosphere. It is most grateful for its loyal customers who, it is hoped, will be pleased with the improvements.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Eye and Ear Infirmary staffs, as received in the office of The News, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora

F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Children's Medical Service

Crawford, J. D., Gribetz, D., Diner, W. C., Hurst, P., and Castleman, B.
The influence of vitamin D on parathyroid activity and the metabolism of calcium and citrate during calcium deprivation.
Endocrinology 61:59-71.

Heeley, A. H., and Talbot, N. B.
Apparatus for collection of urine from female infants.
Pediat. 19:127-128.

Hillman, D. A., Crawford, J. D., and Talbot, N. B.
Observations on the etiology of dwarfism in congenital telangiectatic erythema.
Pediat. 20:268-271.

Laron, Z., and Crawford, J. D.
Skin turgor as a quantitative index of dehydration in rats.
Pediat. 19:810-815.

Talbot, N. B., Crawford, J. D., and Cook, C. D.
Application of homeostatic principles to the management of nephrotic patients.
New England J. Med. 256:1080-1084.

Endocrinology

Benedict, P. H.
Hormone assays as tests of endocrine function, and some endocrine products currently available.
Prog. in Gynec. 3:77-85.

General Medicine

Harwood, R.
Severe diabetes with remission: Report of a case and review of the literature.
New England J. Med. 257:257-261.

General Surgery

Barnes, B. A., Gordon, E. B., and Cope, O.
Skeletal muscle analyses in health and in certain metabolic disorders. I. The method and analysis and the values in normal muscle.
J. Clin. Investigation 36:1239-1248.

Benedict, E. B., and Nardi, G. L.
Peptic stenosis of esophagus.
Am. J. Surg. 93:238-241.

Laboratory Science

Matoltsy, A. G., and Sinesi, S. J.
A study of the mechanism of keratinization of human epidermal cells.
Anat. Rec. 128:55-68.

Neurology, Neurosurgery, and Psychiatry

White, J. C.
Painful postoperative scars. (Editorial)
Surg., Gynec. & Obst. 105:105-106.

Williams, V. P.
The neuroses in general practice.
In M. Clin. North America, vol. 41, no. 5. Philadelphia, W. B. Saunders Company, pp. 1429-1438.

Ophthalmology

Dunphy, E. B.
Radioactive isotopes in ophthalmology.
Am. J. Ophth. 43:857-865.

Dunphy, E. B., Dowling, J. L., Jr., and Scott, A.
Experience with radioactive phosphorus in tumor detection.
A.M.A. Arch. Ophth. 57:485-490.

Pharmacology

Darby, T. D., Goldberg, L. I., Gazes, P. C., and Arbeit, S. R.
Effects of sympathomimetic amines and nitroglycerin on the acceleration ballistocardiogram of the dog.
J. Pharmacol. & Exper. Therap. 119:248-254.

Books

Beck, W. S.
Modern science and the nature of life. (Foreword by Homer W. Smith)
New York, N.Y., Harcourt, Brace and Company.

* * *

Here are a few notes on the International Congress of Dermatology which you might find interesting.

The Congress was held in Stockholm, Sweden, from July 31 to August 6, 1957, and was attended by 1200 dermatologists from 51 countries. Despite violent differences over various theories in Dermatology, the arguments were always friendly, and we often remarked that we wished our countries could settle their differences as reasonably. There were scheduled to be 50 Russian dermatologists at the Congress, but at the last minute only 1 appeared. Everyone tried to pump him for information, of course, but he merely smiled and talked of other things.

The opening ceremony was held at the Konserthuset, where the Nobel Prize Awards are made. It is a beautiful building, somewhat reminiscent of Boston Symphony Hall, and was very colorful with the flags of the countries represented suitably draped. The sessions were held in various auditoriums at the Royal Institute of Technology on Valhalla Way (which address all the Nordic members took as a matter of course). The buildings were relatively new, with a simple, modern type of architecture, but not extreme. The acoustics of the auditoriums, of course, were perfect, and every single public address system worked perfectly, always! My paper was given in an auditorium seating 500, with earphones at each desk, so I had to keep one eye on my audience in front of me, one eye on the men in the translation booths behind me, to see that I was not going too fast, and one eye on the slides which were projected on the wall over my head. This required, as you can see, only three eyes.

My paper was entitled "Treatment of various types of depressed scars by fibrin foam injection". During the past two and one-half years I have been treating acne, smallpox, and traumatic scars by injecting a suspension of fibrin foam beneath the scars. This raises the scar to skin level and, since a shadow is no longer cast by its walls, it is much less conspicuous. The fibrin foam is gradually absorbed, and replaced by normal, soft fibrous tissue.

One of the most rewarding facets of the Congress was one day spent in studying 100 clinical cases, which were very well presented, at one of the hospitals.

The Swedish hospitality justified its reputation. There were trips by boat to Drothingholm Palace, where we enjoyed an opera performance by members of the Royal Opera Company, in a theatre which has remained unchanged for over 150 years. There was also a trip to the University town of Upsala. Membership in the fraternities or clubs at the University is not based on social stratum or even prowess on the football field, but on geographical district alone. However, one may choose either one's own home or the district from which one's father or mother came originally. There was, of course, the usual healthy competition among the various clubs, with remarks of both admiration and horror about one club which had rented part of its ground floor to shops.

The Swedes are very proud of their social security program as applied to medicine. In contrast to the English system, in which a general practitioner is paid a certain amount to look after all the ills of a specified number of people, the Swedish system pays a certain amount — say, two dollars for each office visit — and the doctor is expected to charge whatever he desires above that. The patient always expects to pay some additional fee, and the doctor may set whatever amount he thinks is just. If a patient is really unable to afford anything extra, he may receive free medical care at any of the clinics of the hospitals. One important feature is that the government pays for all medications needed in chronic diseases, such as tuberculosis or cancer.

The highlight of the European trip was an almost "state dinner" in the home of Professor Joseph Hoët of the University of Louvain in Belgium. Dr. Hoët addressed the New England Diabetes Association in 1956 on "Metabolic stress of pregnancy: Its relation to diabetes and to congenital malformation", and he visited Dr. Bauer and the Massachusetts General Hospital at that time. The excellence of the food (the lobster had just been flown from Norway that day, the salad was a work of art, etc., etc.) and the number and rarity of the wines impressed even my wife (who thinks she can cook a good meal). I also met Dr. Eduardo Braun-Menendez of Buenos Aires, Argentina, who is well known in Boston for his work on hypertension. The conversation was most stimulating. The young ladies of the family entertained by singing songs in French, Spanish, German, and, in our honor, Negro spirituals which they had memorized from a Harry Belafonte record!

Arthur S. Spangler, M.D.,
Assistant in Dermatology

New addresses:—

Dr. David W. Barrow (*E.S.* 1937), Milwaukee County Hospital, Milwaukee 13, Wis.

Dr. Austin M. Brues (*E.M.* 1932), Argonne National Laboratory, Lemont, Ill.

Dr. Robert E. Carroll (*E. S.* 1943), Columbia-Presbyterian Medical Center, 180 Fort Washington Ave., New York 32, N. Y.

Dr. Adolfo C. Coussirat (clin. fel. *An.* 1957), Beverly Hospital, Beverly, Mass.

Dr. Willard Dalrymple (*M.* 1947), Harvard

University Health Service, Cambridge 38, Mass.
Dr. Trygve Gundersen (s. *Oph.*), Hotel Fensgate, 534 Beacon St., Boston, Mass.
Dr. Reed Harwood (*W.M.* 1936), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. Jimmie Brockman Holland (r.p. *Psychiat.* 1955), 302 Crosby Blvd., Buffalo 26, N. Y.
Dr. Benjamin B. Jackson (*S.* 1953), 1425 St. James Court, Louisville, Ky.
Dr. Mervyn Jeffries (clin. fel. *An.* 1957), Children's Medical Center, Boston, Mass.
Dr. Donald S. King (*E.M.* 1920), 4 Downing Rd., Hanover, N. H.
Dr. Richard N. Kleaveland (*S.* 1952), Paulsen Medical and Dental Bldg., Spokane 4, Wash.
Dr. James G. Miller (*E.M.* 1943), Mental Health Research Institute, University of Michigan, Ann Arbor, Mich.
Dr. Duane H. Mitchel (*M.* 1943), Belcaro Medical Bldg., 915 S. Colorado Blvd., Denver 22, Colo.
Dr. Robb H. Rutledge (*S.* 1950), 800 5th Ave., Fort Worth, Tex.
Dr. Katharine E. Spreng (*M.* 1955), 10210 Edgewater Drive, Cleveland, Ohio
Dr. Joseph M. Stolman (*Dn.* 1956), 305 Summit Ave., Brighton, Mass.
Dr. Marcy L. Sussman (r.p. *R.* 1930), Diagnostic Laboratory, 1130 E. McDowell Rd., Phoenix, Ariz.
Dr. Jack E. Tetirick (*S.* 1952), 105 Indian Springs Drive, Columbus, Ohio
Dr. Jerome Waldman (a.r.s. *Or.* 1949), 1893 Sheridan Rd., Highland Park, Ill.; 217 Water St., Waukegan, Ill.
Dr. LeMoyne White (*E.M.* 1942), 82 Marlborough St., Boston 16, Mass.

Brief bits:—

Dr. Joseph S. Barr has been named medical adviser to the claims department of Liberty Mutual Insurance Company.

Dr. Henry K. Beecher was one of four anesthetists who were designated as leaders in conjunction with the Centennial Celebration of the Danish Medical Society this past summer. The others were Sir Robert Macintosh of Oxford, Dr. Ralph M. Waters, Professor *Emeritus* of Wisconsin, and Dr. John Gillies of Edinburgh, who was at one time a Visiting Lecturer at this Hospital.

Dr. Oliver Cope was the opening speaker at the meeting of the Hartford Medical Society, held in Hartford, Connecticut, on October 7. His subject was "What I have learned from Cushing's syndrome". On October 17 he was a participant on a panel on "Diagnosis and management of surgical lesions of the adrenals" at the 43rd Clinical Congress of the American College of Surgeons, held in Atlantic City. On October 31 he addressed the Central New York Surgical Society at Syracuse, N. Y., on the subject "Surgery of the adrenal gland".

Dr. Erich Lindemann will deliver an address at the November meeting of the World Health Organization in Geneva, Switzerland, on the subject "The effect of tranquilizing drugs".

Dr. Robert R. Linton was invited to participate in the Sommer Memorial Lectureship sponsored by the St. Vincent's Hospital of Portland, Oregon, during the first week in May. This consisted of lectures and conferences with the staff on surgical subjects, with special reference to some of the vascular diseases and the newer advances in this field. The following week was spent as a visiting surgeon at St. Vincent's Hospital, attending clinics, making ward rounds, and operating on a few patients. It was an interesting two weeks. "The pleasantest part of the trip followed these rather strenuous activities, and this consisted of a day's fishing and running the rapids of the Mackenzie River with Dr. Allen M. Boyden (*W.S.* 1934) and Mrs. Boyden of Portland, in which Mrs. Linton accompanied us. The climax of the trip came when Dr. Gordon E. Jones (*E.S.* 1939) of Olympia, Washington, flew me in his Cessna "180" plane up to Stuart Island in British Columbia for some excellent salmon fishing." In the middle of July, Dr. Linton took part in the Postgraduate Medical Assembly of Southwest Texas, held at Houston, where he spoke on bleeding esophageal varices, the postthrombotic syndrome with ulceration, and varicose veins.

Dr. George M. Noss attended the 12th International Dental Congress held in Rome, Italy, from September 7 to 14, and presented a clinic on "Apicoectomy and periapical curettage".

We have received this new address for Dr. Alfred Yankauer (*C.M.* 1941): Professor of Paediatrics, Madras Medical College, Madras, India. Dr. Yankauer, Director of the Bureau of Maternal and Child Health of the New York State Department of Health since 1952, has been granted a one-year leave of absence to accept a position as medical officer with the World Health Organization. Dr. Yankauer will become Visiting Professor of Social Paediatrics at the University of Madras Medical College. The assignment is part of a World Health Organization project which seeks to create a center for teaching and research in paediatrics in Madras.

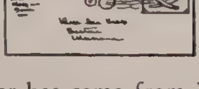
BIOGLETS

Dr. Robert E. Key, Assistant Resident in Orthopedic Surgery — born in Fort Worth, Texas, December 27, 1928; B.S. (combination), Texas Christian University, Fort Worth, 1948; M.D., Texas University Medical Branch at Galveston, 1951; Intern, rotating, and General Surgery, Cleveland City Hospital, Cleveland, Ohio, 1952; U.S. Army: Lieutenant, U.S. Army Hospital, Fort Belvoir, Virginia, 1953-55; Assistant Resident in Orthopedics, Children's Medical Center, Boston, Massachusetts, 1955-56; married; one child.

Dr. Douglas G. Tompkins, Assistant Resident in Orthopedic Surgery—born in New York City, December 23, 1926; A.B., Yale College, 1946; M.D., College of Physicians and Surgeons, New York City, 1950; Intern in Surgery, Presbyterian Hospital, New York City, 1950-52; Lieutenant, MC, USNR, U.S. Naval Hospital, Newport, Rhode Island, 1952-54; Assistant Resident in General Surgery, Millard Fillmore Hospital, Buffalo, N. Y., 1954-55; Assistant Resident in Orthopedic Surgery, Children's Medical Center, Boston, Massachusetts, 1955-56; married; two sons; present address: Chestnut Hill, Massachusetts.

Dr. John D. Turner, Assistant Resident in Medicine—born in Pasadena, California, October 2, 1930; B.A., University of California, Berkeley, 1952; M.D. and C.M., Faculty of Medicine, McGill University, Montreal, Canada, 1956.

Dr. Alfred L. Weber, Assistant Resident in Radiology — born in Fulda, Germany, September 23, 1926; German Army, Berlin and Hungary, 1944-45; College and Graduate School, Würzburg, Heidelberg, Marburg, 1945-51; M.D., Munich University, 1951; Resident in Pathology, University of Munich, 1952; Intern, rotating, Toledo Hospital, Toledo, Ohio, 1953; postgraduate work, University of Michigan, Ann Arbor, 1954-55; Resident in Medicine, Herman Kiefer Hospital, Detroit, Michigan, 1954-55; leave of absence for 9 months to observe in hospitals in England, Sweden, Austria, and Turkey, 1955-56.



This letter has come from Dr. Richard C. Batt (r.p. *R.* 1940), our "singleton" in Glens Falls, N.Y. — that is, the only MGH-er engaged in practice in his immediate vicinity. He writes:

Your last plea for progress notes, obituary data, etc. was referred to my trusty wife. Anne promptly dashed off a public relations job reminiscent of her former work at Fox Movietone. When I explained to her that you are not the editor of a pulp magazine, we added a bit of starch to the manuscript.

I eventually found my ideal location in 1946 in the city of Glens Falls, which is about 50 miles up the Hudson River from Albany. The specialties are well represented here, and the quality of work done in our fine community hospital is much better than average. I have had 3 medical papers published since being here. Local speaking dates, staff sessions, and committee meetings are no exception in a small community! With 3 board radiologists alternating as a team, there are 2 of us at the hospital and the other in our office during the day. Night and week-end calls are divided between Dr. J. A. Glenn (PBB 1950) and me. Dr. Edgar Birdsall, our local X-ray pioneer, is still very active and stimulating at 81 years of age.

Anne and I are rearing 2 boys and a girl. The school system is excellent. Skiing and skating are our favorite winter pastimes, and spring brings good fishing. Summer provides much fun at our camp on Lake George, which is only a 20-minute drive from the hospital.

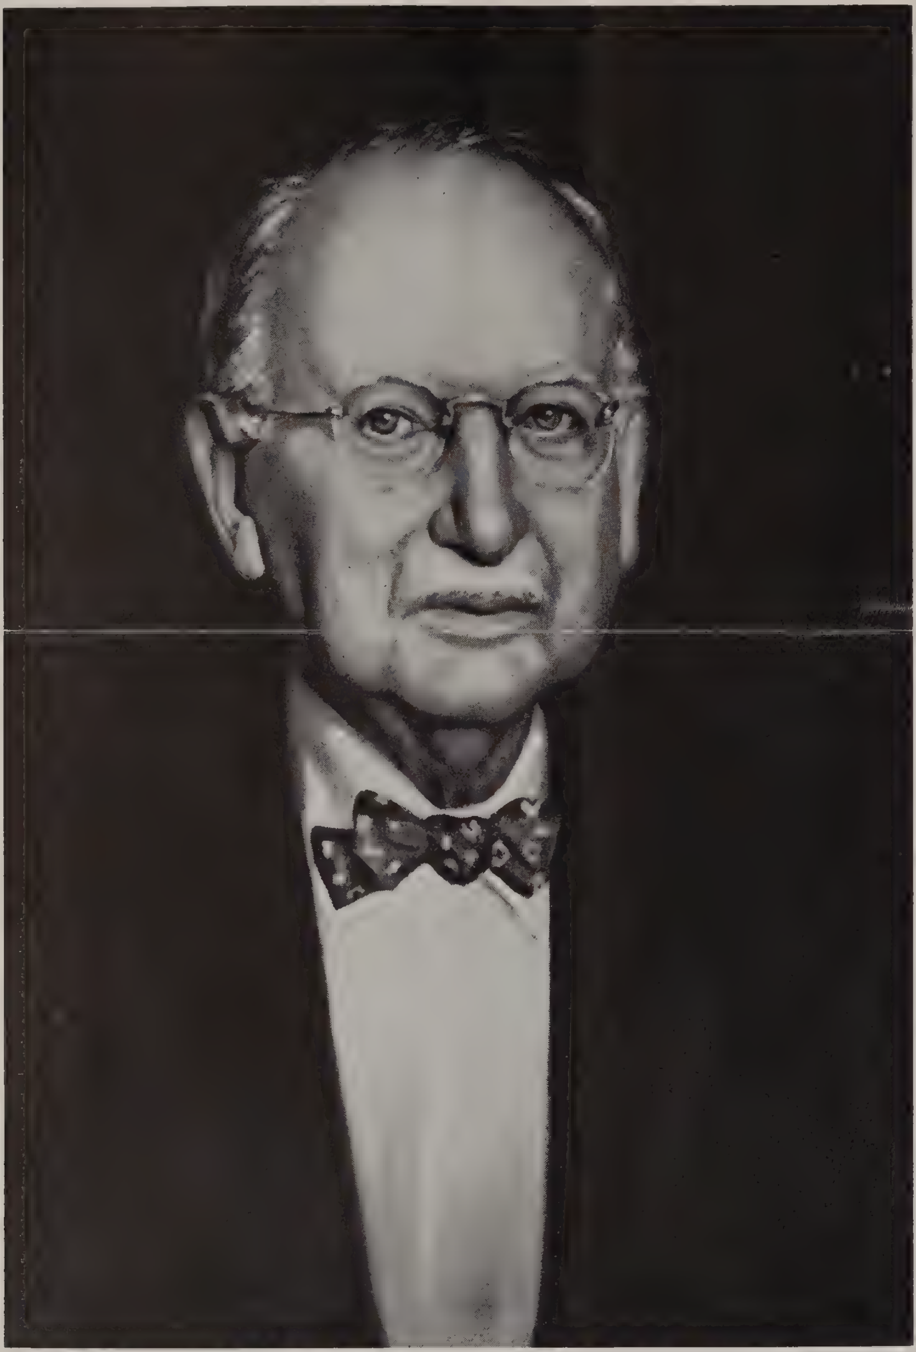
Returning to the M.G.H. is a biannual affair with us. Anne now likes the bean town almost better than her old metropolis down river. New York City and Montreal involve about the same travel time from here by auto or airline as Boston does. Since being here I have enjoyed visits from Otto Sahler, Larry Robbins, Phil Giddings, Ernest Daland, and other MGH-ers. Let's have more of you drop in.

Dr. Robbins received this letter from Dr. Frederick S. Tomchik (r.p. *R.* 1955) last June. It was written from the 2nd General Hospital, APO #180, and reads:

After all this time you're probably wondering whether I disappeared behind the Iron Curtain. Despite the lack of correspondence, I've often thought about you all, even sometimes when I didn't have a puzzling set of films in front of me! When I think back, it's hard to believe that it's already been nine months since I left the General. They've been so eventful, it would take quite a volume to even sketch them.

I've wound up as radiologist for the 2nd General Hospital in Landstuhl, Germany, which is roughly 15 miles east of the Saar and 25 miles north of the northeast border of France. The nearest city is Kaiserslautern, about 10 miles east. The hospital is one of the biggest and is reputed to be probably the best of the Army hospitals in Europe, with sizable medical, surgical, pediatric, ob-gyn, orthopedic, urologic, and neuropsychiatric services. Within two months the neurosurgical center for Europe will also be here, and we will lose the infectious disease center, which has provided me with more cases of active tuberculosis every month than I saw in a couple of years before. I'm the only head of a major department who isn't a lieutenant colonel or colonel; but, as a dyed-in-the-wool civilian, I'm not too rank-conscious. Anyway, the brass round here doesn't do any rank-pulling with medical colleagues, and the whole staff is really very pleasant, cooperative, and congenial.

When I first got here, there were two other radiologists. Col. Harold Vinson, who spent a year in therapy with you at M.G.H. some years ago, was the department head, and he was much interested in hearing news of you and the other staff members. Within two months after I arrived, Colonel Vinson developed a cervical disc which had to be operated upon, and when he recovered from that he retired. Meanwhile, the other radiologist was transferred, leaving me as head of the department by default, you might say. The only trouble with being chief is that, although I



Dr. Frederick H. Verhoeff, Consulting Chief of Ophthalmology, Massachusetts Eye and Ear Infirmary — photograph of a portrait done by Eleanor K. Cavanaugh (Mrs. Thomas Cavanaugh)

have 15 people in the department, I'm the only radiologist. However, it is rumored that eventually I will get an assistant partially trained in radiology. Apparently radiologists are pretty scarce in the Army. Some hospitals have none.

In addition to the hospital X-ray work, I read films and do fluoroscopies for several outlying dispensaries and other units—for a while even including two Canadian fighter wings. I occasionally have films sent in for consults from as far away as Italy and France. A while back a U.S. general from Pakistan was flown up for a G.I. work-up, and next Tuesday I will be fluoroscoping an admiral from the Mediterranean fleet. Right up in the social swim! We have about 2500 examinations a month to read and about 90 fluoroscopies, which is quite a load for a slowpoke like me. Lately, the commanding officer of the hospital, Colonel DeYoung, who is a radiologist, has been coming down for a few hours a week to help me out, and that's made life tolerable here, although it's still too much of a load for comfort. In addition to the routine X-ray and administrative work, I conduct teaching conferences each week for the medical and surgical services. Needless to say, many of the MGH teachings are passed on at these sessions, and I usually manage to come up with a "pearl of the week" that's new to at least most of the staff. Unfortunately, as you might expect with a young patient group getting free medical service, many examinations are negative. Except for lymphomas and a few soft-tissue and bone tumors, I have seen exactly *no* malignant disease. However, every few days a really interesting case turns up. Some unusual ones lately included an osteitis pubis in a 19-year-old male, chondrodystrophia calcificans congenita, a classic renal artery aneurysm, and the other day a "phantom disc" phenomenon in the symphysis pubis of a young woman 8 months pregnant. I've never heard of the latter before. We have a great deal of traumatic work, chiefly auto accidents, but also including a very impressive number of mandibular fractures incurred in the gasthauses (taverns). Strangely enough, although we have a corresponding number of fractured metacarpals, they are always incurred by falling down!

Life over here has been pretty hectic and complicated, and up to a month or so ago, Barbara and I hardly ever had a whole hour to relax in at the end of the day. Barbara and the boys got here in late November, and we moved three times before finally getting our permanent government apartment two months ago. We really have been settled for only about a month. The children have been having a running and so far indecisive battle with a host of Old World viruses, and have just got over the chickenpox. The major excitement lately was the arrival of our fourth boy two months ago. He's such a big fellow compared with the others that I still occasionally "scratch me head" over it! The new baby, our government apartment, and our household goods all arrived in a two-week period, and for a couple of weeks things were a real chaos here. But now things are looking up, and the worst is behind us.

Spring busted out all over here quite early, and for six weeks the weather most of the time has been like May at home. We now have an excellent maid who is unfortunately available only three or four days a week. However, the last three week ends she's been able to stay here with the children while Barbara and I got out for a look at some of the country within 150 miles of here. We've been to Baden-Baden and the northern part of the Black Forest, to Heidelberg and the country north and east of it, to Frankfurt, and to the most scenic part of the Rhine, between Koblenz and Mainz, where it winds between steep hillsides, most of which have vineyards clinging precariously to them, carefully terraced to keep them from falling into the Rhine. Along there, there is a castle or the ruins of one perched up on top of almost every imposing hill overlooking the river. All round here, close to home, the countryside is really beautiful, with quite a bit of variety. Just from here to the Rhine, a matter of some 30 miles, one passes through rolling rural scenery, with the hills a patchwork of small fields and woods, then into thick evergreen forests, then to the vineyard-covered slopes just west of the Rhine, and finally onto the flat plain that runs east to the Rhine. And, of course, every few miles one passes through another little German village, with its red sandstone houses and its red-tiled roofs, usually tucked into a cleft between the hills. The distribution of population in Germany, away from the relatively few large cities, is entirely different from that in the U.S. It is extremely rare to see separate farmhouses set in the middle of the farms. Instead, the farmers live in villages, averaging perhaps a few dozen houses which are only a few miles apart in general, and they walk out to their fields to work them. Around the towns the fields are big crazy quilts of separate small plots, with no buildings at all on them. I gather that this is a remnant of the Middle Ages when they banded together for protection in small villages, sometimes with a wall completely around the town (we've visited one such town), and often with a castle sitting on a nearby hill. So far, Barbara and I have just sort of surveyed the possibilities for sight-seeing, but we're eagerly awaiting a chance to get round more. We are only a few miles from one branch of the Autobahn, so we can get to places fast on that.

While we were at Fort Sam Houston, C. C. [Chiu-chen Wang] and I visited Colonel Isherwood at the hospital. He was a very pleasant man and very kindly spent almost two hours with us, showing us round his departments (he actually has two on the base, about a half-mile apart). I was surprised to find that he had an Elima biplane unit. They are using it for cerebral angiography as well as for angiocardiography, and apparently both the X-ray and Neurosurgery Departments are very much satisfied with the cerebral angiograms. I thought you and Dr. Wyman might be interested in their technique, so I jotted it down. They use 50% Hypaque. The factors were as follows: AP view — 110 KVP, 300 MA, 4 impulses (1/30 sec), 36″ distance; lateral view—same factors except that distance is 50″. They let me have two sample films which they picked out at random and which they said were about what they usually get, and I'm sending them along to you. I'm also including a photograph of me which I hope will pass muster for your gallery!

Best regards to all the staff.

THE NEWS

No. 172 Boston, Mass. December 1957

THE MIXTER LABORATORIES FOR NEUROSURGICAL RESEARCH

In 1911 (the exact date is not available) Dr. William Jason Mixter was given the "neurosurgical assignment" under his father, Dr. S. J. Mixter, at the Massachusetts General Hospital. Two beds for neurosurgical patients were made available. On October 16, 1957 the fourth floor of the new Warren Building was designated "The Mixter Laboratories for Neurosurgical Research". Thirty-one professional and technical workers are currently engaged in various research activities in these laboratories.

More than two hundred guests attended the dedicatory exercises and were privileged to hear from Dr. Dean A. Clark, General Director of the Hospital, Professor Francis O. Schmitt, a member of the Board of Trustees, and the Rev. Dr. Theodore P. Ferris, rector of Trinity Church, Boston. Through these speakers they learned of the current research program of the Neurosurgical Service, the importance of such an effort to the Hospital, and the debt which the Massachusetts General owes to the family for which the floor is named. The possibility that the Mixter Laboratories might, in the near future, be a part of a "Neurologic Center" was mentioned by Dr. Clark. Many of us find this prospect most exciting for reasons which I shall attempt to outline.

With a rapidity which all but numbs comprehension, advances have occurred in the realm of the physical sciences. Twelve short years have demonstrated that man can tap the power residing in the atom and that he can cast a new "moon" into the universe. Such feats as these have, however, been accompanied by a fear that man has so little understanding of his brain, his mind, and his collective actions as to have sown the seeds of his own destruction through being educated (i. e., acquiring skills) beyond his intelligence.

In attempts (which at times seem almost frantic) to understand, protect, and heal the brain, there is a danger that science, which has been defined as "systematized knowledge derived from observation, study, and experimentation", is in danger of being superseded by opinions, intuitions, and even superstitions. This is so because science gives its answers only slowly, reluctantly, and after hard labor on the part of the seeker. The other methods of arriving at "truth" need only a glib exponent and a credulous audience.

To overcome this danger it is desirable that the normal and abnormal functioning of the brain be considered in relation to the normal and abnormal functioning of the body as a whole. To this end we have university faculties, medical schools, and hospitals working together and, particularly, is this true at the Massachusetts General. The Warren Building is an integral part of the Hospital; no space barrier separates its activities from those of other units. The laboratories for the Department of Neurology on the third floor connect directly with clinical facilities in the Baker Memorial. Similarly, the neurosurgical laboratories adjoin and are easily accessible to bed space for the care of neurosurgical patients. Thus, in the midst of a busy general hospital there has been developed a nucleus for the study and care of disease of the central nervous system. It is hoped that psychiatry will also become a part of this loose but potentially effective federation. The value of such an arrangement is well illustrated by a brief consideration of the problem of circulatory disease of the brain. This illness may manifest itself by physical disabilities or mental or emotional aberrations or a combination of all three. Patients so affected are almost invariably first seen and treated by a general physician. Such "medical" illnesses as arteriosclerosis, hypertension, and congenital heart disease are frequently present and may be important factors in the illness. Finally, certain patients appear to benefit from surgery, particularly when intracranial hemorrhage has occurred. Advance in a better understanding of the diagnosis and treatment of circulatory disease of the brain obviously requires the cooperation of physicians, neurologists, neurosurgeons, and psychiatrists; and any cooperative effort is materially enhanced by spatial contiguity.

At the same time, however, there is reason to believe that research is best pursued in as independent an atmosphere as possible. Therefore, the development of a "center" consisting of cooperating, autonomous services would seem to have certain advantages over the more closely knit but potentially isolated "institute".

The contributions that the neurosurgical investigator can make to an understanding of the function of the human nervous system are several. One of the most important, however, might be termed philosophical. Neurosurgeons, more than any other group, see, feel, and work directly upon the living brain. From these experiences they are apt to form the opinion that brain disease, be it manifested by a physical disability or disorders of thinking or behavior, has a "physical basis" subject to correction by "physical means". Whether this opinion be completely true, it would appear to be a logical foundation upon which to build a body of knowledge based upon observation, study, and experimentation. For these reasons, the interests of the neurosurgeon lie in obtaining further information concerning such things as the effects of drugs and various forms of physical energy upon the central nervous system, as well as the anatomical and physiological foundations upon which brain function is based. Within this framework a number of investigations are now in progress and will be materially benefited by the more adequate quarters and the opportunity for frequent exchange of ideas among the scientific and clinical workers, which the new Mixter Laboratories make possible. Radioisotopic and microchemical techniques are being employed to further our understanding of cerebrospinal fluid circulation, the cause and prevention of brain swelling secondary to injury and disease, and the manner in which the central nervous system accepts or rejects certain toxic and nutrient substances offered it by the blood stream.

If certain chemical compounds could be incorporated into malignant cells and then made radioactive, the treatment of brain tumors would be materially advanced. This study, combining the skills of a physicist and a biochemist, is being vigorously pursued.

With focused ultrasound it is possible to produce discrete areas of destruction deep within the central nervous system. This technique may prove valuable as a method of treatment, but the necessary investigations of the pathologic nature of the lesions and the ability of the operator to control their size and shape are currently yielding new information concerning the reaction of the brain to injury and the manner in which it attempts to carry out the reparative process.

Precise placement of electrodes deep within the brain to study function in terms of electrical activity as well as to control intractable pain is still another program of investigation which has been materially enhanced by the new laboratories.

The examples thus far given are intended to illustrate the type of "basic research" which is now in progress, and we are fortunate in having with us scientists who hold appointments on the Hospital staff as well as in the basic science departments (e. g., physics, chemistry, and biology) of Harvard University and Massachusetts Institute of Technology. It is becoming increasingly evident that this type of collaboration, as well as the closer cooperation with specialists in other branches of medicine and surgery, offers the best chance for advancement of our knowledge of the function of the central nervous system. It is, however, incumbent upon a hospital laboratory to concern itself with patients, and provision has been made for this important aspect of medical investigation. Radioisotopic localization of brain tumors is a valuable procedure in daily use within the Hospital. The apparatus employed for such localization is now installed in quarters adjoining the neurosurgical floor of the Baker Memorial. On the other side of these quarters, moreover, is the Physics Laboratory, which is continually investigating ways of improving the reliability of the method.

Space has also been made available for the detailed study of patients with unusual diseases of the central nervous system before and after surgery. Furthermore, the postoperative results of all our neurosurgical procedures will be under continuous scrutiny through the use of modern statistical methods. For example, we are presently investigating the relative safety and value of cerebral arteriography as a result of our experiences with this procedure in about one thousand patients. This is a necessary but difficult and time-consuming task, which will be made much easier by the availability of proper facilities and techniques which can be applied not only to this but to other clinical studies.

Within a few weeks we shall have an electron microscope available, and by its use we hope to learn more about the microscopic anatomy, normal and pathologic, of the brain and spinal cord. Perhaps it will help us to understand more of the nature of the changes which lead to the development of brain tumors and of the effectiveness of the newer methods of treatment.

Although this general survey of our current program might indicate a relatively fixed approach to a study of the central nervous system, this is definitely not the case. We are fortunate in the fact that our laboratories are sufficiently flexible in design to allow for a changing emphasis in research activity. We look forward particularly to those changes, which will allow even closer collaboration with other clinical services as well as with our colleagues in the basic science disciplines. And as we study, observe, and experiment, we hope the scientific results will prove to be of importance not only to the survival of sick patients but that they will also help us to understand better the basic processes underlying the variations in thinking, acting, and feeling which so profoundly influence all of man's activities.

H. Thomas Ballantine, Jr., M.D.,
Associate Visiting Neurosurgeon

For 51 years the names of Dr. W. Jason Mixter and the Massachusetts General Hospital have been very closely associated. Dr. Mixter began his internship at the Hospital in 1906. In 1909 he received his first appointment to our Visiting Staff as Assistant to Surgeons in the Out-Patient Department. Two years later he was made Assistant Surgeon to Out-Patients, and from then on he was elevated successively to Surgeon to Out-Patients, Assistant Visiting Surgeon, Associate Surgeon, and Visiting Surgeon, until 1933 when he became Chief of the Neurosurgical Service. He held this position until February of 1941, when he was appointed to our Board of Consultation. However, in June of that same year he was asked to resume the direction of the Neurosurgical Service during the absence of Dr. James C. White, the newly appointed Chief of Neurosurgery, who was called away from the Hospital for the duration of World War II. During this period Dr. Mixter continued to serve also on the Board of Consultation. From 1947 to 1949 he was a member of our Board of Trustees, and in 1954 he was made an Honorary Surgeon, which title he still holds. In addition to all this, he has served as Consulting Surgeon at McLean Hospital for the past several years.

Dr. Mixter's professional record has been so well known, both nationally and internationally, since the early days of his pioneering work in the field of neurosurgery up to his more recent work in reference to the problem of the ruptured intervertebral disk, that any attempt to do justice to either the doctor or the man, short of a full-length biography, is frustrated by the magnitude of the subject. Unashamedly admitting our inadequacy for the task, we fall back upon these closing words of the address delivered by the Reverend Dr. Theodore P. Ferris, rector of Trinity Church in Boston, at the dedication of the Mixter Laboratories in the Warren Building on October 16: "The proof of the man is the man himself, the man you meet, the man you instinctively trust or distrust. Dr. Mixter is the kind of man to whom thousands of people have been willing and glad to intrust their lives. Nothing more need be said."

In addition to the dedication of the Mixter Laboratories, Ether Day was observed this year with the customary awarding of Service Pins. The occasion took place in the Moseley Rotunda, with Dr. Clark presiding and awarding the pins. Professor Francis O. Schmitt brought greetings from the Board of Trustees and expressed appreciation of the Board for the years of faithful service on the part of so many who are associated with the Hospital. Professor Schmitt then gave a most interesting and informative talk on "The Mixter Laboratories: Crossroads of natural and medical sciences".

Then came the awarding of the pins. Of the nonprofessional group, 111 received pins for 5 years of continuous service at M.G.H., 59 for 10 years, 4 for 20 years, and 5 for 30 years. Members of our professional staff who received 25-year pins numbered 5 this year.

Following these ceremonies, refreshments were served in the Warren Building Lobby, followed by tours of the new Mixter Laboratories.

* * *

Dr. Edwin F. Cave was elected 2nd Vice-President of the American College of Surgeons, at their recent meeting in Atlantic City. Dr. Cave conducted a four-day panel discussion there on "Fractures in children and the aged".

Dr. Arthur L. Watkins was the recipient of the Presidential Award, given by the International Poliomyelitis Congress this past summer, in recognition of his "contributions to mankind in the fields of medicine and science". A letter to Dr. Watkins from Stanley E. Henwood, Executive Secretary of the Congress, reads:

> In view of your absence from the banquet in Geneva on July 11, 1957, we are mailing to you, under separate cover, the "Presidential Award", which was established by resolution for each physician and scientist who presented a paper or otherwise participated in a panel of the International Poliomyelitis Conferences held in New York, Copenhagen, Rome, or Geneva.
>
> These awards were presented by the President of the Congress, Mr. Basil O'Connor, on the night of the banquet in Geneva in appreciation of outstanding and valuable services which helped to make the past four International Poliomyelitis Conferences successful.

The Board of Trustees, at their meetings on October 4 and 18, voted:

To accept with regret the resignation of Dr. William P. Chapman, effective October 31;
To rescind the appointment of Dr. Walter G. Heimann, who was to have begun on April 1, 1958 as Assistant Resident in Radiology;
To advance the appointment of Dr. Harold Simon as Second Assistant Resident in Radiology to April 1, 1958.

To reappoint:

Sidney Leskowitz, Ph.D. as Associate Immunologist in the Department of Medicine for one year, beginning October 1;
Dr. Richard J. Stenger as First Assistant Resident in Pathology, for the period October 1, 1957 through June 30, 1958.

To appoint:

Dr. Florosa A. Bautista as Assistant Resident on the Children's Medical Service, for the period September 1, 1957 through February 28, 1958;
Dr. Joseph H. Dimon, III, as Assistant Resident in Orthopedic Surgery for one year, beginning November 23;
Mr. William H. Ellett as Assistant Biologist (Medicine) for one year, beginning September 24;
Dr. Henry C. Everett, III, as Assistant Resident in Psychiatry for one year, beginning November 1;
Dr. Frederick A. H. Greenwood as Assistant Resident in Orthopedic Surgery for one year, beginning February 4, 1958;
Dr. Richard F. Jackanich as Assistant Resident in Anesthesia, beginning October 15;
Dr. Wallace A. Jones as Third Assistant Resident in Pathology for one year, beginning July 1, 1958;
Philip E. Kubzansky, Ph.D. as Assistant Psychologist, effective as of September 15;
Dr. George F. Kwass as Third Assistant Resident in Pathology for one year, beginning July 1, 1958;
Dr. Kasian Lim as Second Assistant Resident in Surgery, for a period of three months, beginning October 1;
Dr. John J. Martin as Second Assistant Resi-

dent in Radiology, beginning July 1, 1958;

Mr. Emery Nyilas as Assistant Biologist (Medicine) for one year, effective as of August 5;

Dr. Victor J. Rosen, Jr. as Third Assistant Resident in Pathology for one year, beginning July 1, 1958.

The Trustees also voted that the Psychiatry Service be granted an additional Resident in their House Staff, making a total of four.

At their meetings on October 9, 16, and 23, the General Executive Committee voted:

To accept the resignation of Dr. Ruth K. Freinkel from the position of Resident in Dermatology, effective October 31. It was also agreed that upon her return to duty, presumably March 1, 1958, she would be appointed to the position of Clinical and Research Fellow in Dermatology;

To accept with regret the resignation of Dr. Marc P. Moldawer from the position of Clinical Assistant in Medicine, effective September 30;

To conclude the appointment of Dr. Henry J. Powsner as Research Fellow in Neurosurgery, as of September 20.

To change the titles of:

Dr. Hugh R. Dudley, Jr. from Research Fellow in Pathology to that of Clinical and Research Fellow in Pathology, retroactive to July 1;

Dr. Edmund Klein from Assistant Resident in Dermatology to that of Clinical and Research Fellow in Dermatology, effective as of September 1.

To promote from the position of Intern to that of Assistant Resident in Medicine for one year, beginning July 1, 1958:

Dr. Richard H. Aster
Dr. George P. Baker, Jr.
Dr. Robert B. Layzer
Dr. John T. Potts, Jr.
Dr. John W. Singleton
Dr. Donald W. Sutherland
Dr. David Van Buskirk
Dr. Peter M. Yurchak

To reappoint:

Dr. Gardner F. Fay as Assistant Resident in Orthopedic Surgery, for the period September 1 through December 31;

Dr. Edward L. Ferguson as Second Assistant Resident in Surgery, beginning August 1;

Dr. Ira A. Ferguson, Jr. as Second Assistant Resident in Surgery, beginning September 1;

Dr. Harold L. May as Second Assistant Resident in Surgery, beginning November 1;

Dr. Lot B. Page as Clinical and Research Fellow in Medicine for one year, beginning October 1, with the privilege of being called in consultation occasionally in the Baker Memorial and Phillips House, but not to be allowed to admit patients under his own name;

Dr. Maurice M. Pechet as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Dr. José R. Solis as Graduate Student Assistant and Clinical Fellow in Pathology, for the period November 12, 1957 through June 30, 1958.

To appoint:

Dr. Neville A. Booth as Clinical Assistant in Dentistry, effective immediately;

Dr. Jacques A. Corvilain as Graduate Student Assistant in Medicine, beginning October 7;

Dr. Paul R. Draskóczy as Research Fellow in Pathology, for the period September 16, 1957 through June 30, 1958;

Dr. Mircea Enesco as Clinical and Research Fellow in Medicine, effective as of October 1;

Dr. Norton Fishman as Clinical Assistant in Dentistry, effective immediately;

Dr. Leonardo S. J. Martin as Clinical and Research Fellow in Urology for one year, beginning November 1;

Dr. Antal M. Martonosi as Research Fellow in Medicine, beginning October 1;

Dr. Hermann K. Schueler as Clinical Fellow in Urology, effective as of October 1;

Dr. John B. Taylor as Clinical Assistant in Dentistry, effective immediately;

Dr. Jerome K. Walker as Clinical Assistant in Dentistry, effective immediately;

Irving Weliky, B.S. as Research Fellow in Medicine, effective as of October 1.

The General Executive Committee also appointed the following doctors as Graduate Student Assistants in Medicine, assigned to Cardiology, for one year, beginning October 1:

Dr. Nerio E. Casanova	Cabimas, Venezuela
Dr. Garo H. Garabedian	Jerusalem (old city), Jordan
Dr. Arthur H. Griep	Evansville, Ind.
Dr. Masao Ikeda	Tokyo, Japan
Dr. Huk Y. Ma	Pusan, Korea
Dr. Jean-Rene Marcoux	Quebec, Canada
Dr. Huerta C. Neals	Jersey City, N. J.
Dr. Robert T. Rengarts	Boynton Beach, Fla.
Dr. Patrick P.-T. Wu	China

Having obtained his permanent Massachusetts license, Dr. Frank R. Ervin's title has been changed from Clinical Fellow in Psychiatry to that of Clinical Assistant in Psychiatry.

MASSACHUSETTS EYE & EAR INFIRMARY

At a meeting of the Executive Committee of the Massachusetts Eye and Ear Infirmary, held on October 21, the following appointments were made:

Dr. Joseph L. Dowling Jr.—Assistant in Ophthalmology;

Mr. Edward O. Dunlavey—Research Assistant in Otology;

Dr. Carl H. Ernlund—Consulting Surgeon in Otolaryngology;

Dr. Ann S. Morgan—Assistant Resident in Ophthalmic Pathology;

Dr. Harold S. Novey—Research Fellow in Otology.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Endoscopy

Atkins, L., Benedict, E. B., and Dreyfuss, J. R.
Correlation of symptoms with gastroscopic findings, X-ray findings and gastroscopic biopsy in gastritis.
Gastroenterology 33:385-388.

Benedict, E. B.
Positive stomach diagnosis by gastroscopic biopsy.
In Surg. Clin. North America, vol. 37, no. 5, Philadelphia, W. B. Saunders Company, pp. 1239-1247.

General Surgery

Barnes, B. A.
Mortality of burns at the Massachusetts General Hospital.
Ann. Surg. 145:210-222.

Barnes, B. A., Eddison, G. G., and Cope, O.
Preparation and bioassay of a low magnesium liquid diet for human consumption.
Surgery 42:643-651.

Taylor, G. W.
The role of the surgeon in advanced cancer.
Radiology 69:341-343.

Laboratory Science

Jeanloz, R. W.
The synthesis of D-allosamine hydrochloride.
J. Am. Chem. Soc. 79:2591-2592.

Jeanloz, R. W., and Gansser, C.
4-*O*-methyl-D-glucosamine hydrochloride (2-amino-2-deoxy-4-*O*-methyl-D-glucose hydrochloride).
J. Am. Chem. Soc. 79:2583-2585.

Jeanloz, R. W., and Jeanloz, D. A.
Partial esterification of methyl 4,6-*O*-benzylidene-alpha-D-glucopyranoside in pyridine solution.
J. Am. Chem. Soc. 79:2579-2583.

Jeanloz, R. W., Schmid, D. M., and Stoffyn, P. J.
3,4-di-*O*-methyl-D-galactosamine hydrochloride (2-amino-2-deoxy-3,4-di-*O*-methyl-D-galactose hydrochloride).
J. Am. Chem. Soc. 79:2586-2590.

Jeanloz, R. W., Stoffyn, P. J., and Tremege, M.
Chemical structure of beta-heparin.
Federation Proc. 16:201.

Schmid, K.
Characterization of an "electrophoretically homogenous" human serum albumin.
J. Am. Chem. Soc. 79:4679-4682.

Tarasiejska, Z., and Jeanloz, R. W.
The synthesis of D-gulosamine.
J. Am. Chem. Soc. 79:2660.

Tarasiejska, Z., and Jeanloz, R. W.
The synthesis of D-gulosamine hydrochloride.
J. Am. Chem. Soc. 79:4215-4218.

Waksman, B. H., Adams, R. D., and Mansmann, H. C., Jr.
Experimental study of diphtheritic polyneuritis in the rabbit and guinea pig. I. Immunologic and histopathologic observations.
J. Exper. Med. 105:591-614 (10 additional unnumbered pages of plates).

Neurology

Schwab, R. S., Osserman, K. E., and Tether, J. E.
Treatment of myasthenia gravis: Prolonged action with multiple-dose tablets of neo-

stigmine bromide and mestinon bromide.
J.A.M.A. 165:671-674.

Neurosurgery

White, J. C.
Cardiac pain: Anatomic pathways and physiologic mechanisms.
Circulation 16:644-655.

Oral Surgery

Olin, M. J.
Continuous intravenous sedation: Its applicability in the dental office.
J. Oral Surg. 15:286-288.

Otolaryngology

Kelemen, G.
Fenestration of the labyrinth: A bibliography revision, 1957.
Psycho-Acoustic Laboratory, Harvard University, PNR-205.

Psychology

Silverman, A. J., Cohen, S. I., Zuidema, G. D., and Lazar, C. S.
Prediction of physiological stress tolerance from projective tests: The focused thematic test.
J. Project. Tech. 21:189-193.

Radiology

Reeves, J. D.
Medical progress: Clinical applications of radioactive isotopes.
New England J. Med. 257:454-461, 507-513, 559-566, 605-612.

Schulz, M. D.
Radiotherapy in advanced and incurable malignant disease.
Radiology 69:321-323.

Wyman, S. M.
Dissecting aneurysm of the thoracic aorta: Its roentgen recognition.
Am. J. Roentgenol. 78:247-255.

Urology

Parkhurst, E., and Landsteiner, E. K.
Management of renal trauma.
Surg., Gynec. & Obst. 105:393-400.

VOLUNTEER GROUPS

DISTAFF CLUB

This is a very busy time of year for the Distaff Club. On November 15 a very successful bake sale was held in the Brick Corridor. The Club wishes to thank all those who supported this sale.

It is due to such enthusiastic support that the Club is able to undertake its various projects. A recently completed project was the making of thirteen pairs of gay curtains for the Children's Medical Clinic in the Out-Patient Department. Members who participated in the sewing included Mrs. R. P. Fornshell, Mrs. N. T. Griscom, Mrs. J. N. Hicks, Mrs. R. T. N. Hunt, Mrs. A. L. Hurst, Mrs. J. W. Josse, Mrs. W. E. Karnes, Mrs. A. E. Miller, Mrs. G. C. E. Mueller, Mrs. J. B. Tallon, Mrs. D. G. Tompkins, and Mrs. G. D. Zuidema. The committee was supervised by Mrs. J. J. Greenberg.

Our November meeting heralded the holiday season very appropriately. Mrs. Mildred Nolte, from the Y.W.C.A., showed us the professional way to wrap Christmas gifts. Mrs. S. B. Friedman and Mrs. E. W. Salzman were hostesses for this meeting on November 20, at the Hospital.

The second issue of the "Distaff News" was published the first week in December. This newsletter is enjoyed by all our members. It is edited by Mrs. Charles F. McKhann, III.

All of us are excitedly anticipating our annual Distaff Christmas Party. Committees are making preparations for the affair, which will be held on December 11, at 8 P.M., in the Penthouse. It is rumored there will be a surprise visitor at the party!

On December 17, members of the Club will gather to wrap gifts for children, which will be distributed at the MGH Christmas Party. This is always one of the pleasantest activities of the holiday season. Mrs. David Van Buskirk will be our hostess.

New addresses:—

Dr. Daniel K. Bloomfield (r.p. 1957), Dept. of Chemistry, Harvard University, Cambridge, Mass.

Capt. Robert D. Breer, MC, USAR (a.r.p. *C.M.* 1957), General Delivery, Weaver, Ala.

Dr. James M. Davis (*S.* 1948), 1661 Riverside Ave., Jacksonville, Fla.

Capt. Alexander N. Drescher, MC, USAR (clin. & res. fel. *C.M.* 1956), U.S. Army Hospital, Fort Carson, Colo.

Dr. George F. Emerson (*E.S.* 1939), 764 Main St., Hingham, Mass.

Dr. Benjamin B. Jackson (*S.* 1953), 1206 Heyburn Bldg., Louisville, Ky.

Dr. Zvi Laron (r.p. *C.M.* 1955), Dept. of Pediatrics B, Rambam Hospital, Haifa, Israel

Dr. Thomas C. Leinbach (a.r.s. *Or.* 1956), 330 N. Fifth St., Reading, Pa.

Dr. Sergio A. Leiseca (gr. stud. a. *S.* 1953), Ave. 49—3401—Kohly, Habana, Cuba

Dr. Marc P. Moldawer (clin. a. *M.* 1957), Baylor University College of Medicine, Houston, Tex.

Dr. Burness E. Moore (r.p. *Psychiat.* 1942), 152 E. 73d St., New York 21, N. Y.

Dr. Vincent P. Perlo (a.n.), Warren Building, Massachusetts General Hospital, Boston 14, Mass.

Dr. Oswald H. Robertson (*W.M.* 1914), Dept. of Biology, Stanford University, Stanford, Calif.

Dr. David B. Sheldon (S. 1951), 10911 Weyburn Ave., Los Angeles 24, Calif.

Dr. Philip Solomon (a. psychiat. 1937), 57 Chatham St., Brookline 46, Mass.

Dr. Jack E. Tetirick (*S.* 1956), 131 S. Grant Ave., Columbus, Ohio

Dr. Norman Trieger (*Dn.* 1955), 29 Commonwealth Ave., Boston 16, Mass.

Dr. John L. Wilson (*E.S.* 1940), Dept. of Surgery, School of Medicine, American University of Beirut, Beirut, Lebanon

Brief bits:—

Dr. Edward B. Benedict attended the meeting of the American College of Gastroenterology on October 22 and discussed a paper by Dr. Rossien and Dr. Stanton entitled "A critical evaluation of roentgenology and gastroscopy in the diagnosis of gastric disorders".

Dr. Mary A. B. Brazier has been appointed a Consultant to the National Institute of Neurological Diseases and Blindness of the National Institutes of Health.

Dr. Benjamin Castleman attended the International Congress of Clinical Pathology in Brussels last July. Following the meeting he visited several medical centers in Zurich, Holland, Copenhagen, and London. He saw many former MGH-ers, all of whom wished to be remembered to their friends here. They included Dr. Charles G. DeMuylder of Louvain (gr. stud. a. *S.* 1948), Dr. Andries Querido of Leyden (clin. & res. fel. *M.* 1950), Dr. Hans H. Wandall of Copenhagen (clin. fel. *S.* 1946), Mrs. Uytte Wang also of Copenhagen (a former pathology technician here), and George Cunningham, Professor of Pathology at the Royal College of Surgeons in London. Dr. and Mrs. Castleman were entertained by Professor George Payling Wright of Guy's and his wife, Dr. Helen Payling Wright. They both wished to be remembered to their friends at M.G.H.

Dr. John D. Reeves spoke at the Southwest Regional Cancer Conference held in Fort Worth, Texas, on September 20 and 21. He talked on "Diagnostic applications of radioactive isotopes" and also on "Supervoltage X-ray and cobalt-60 therapy".

Dr. Carter R. Rowe moderated a two-day symposium on "Fractures in the aged" at the recent meeting of the American College of Surgeons in Atlantic City, New Jersey.

Dr. Grantley W. Taylor lectured before the California Academy of General Practice, at their meeting in Los Angeles on November 5. His subject was "Treatment of breast cancer". He also served as panelist on the program for the Pan-Pacific Surgical Association, held in Honolulu on November 19, where he spoke on "The treatment of carcinoma of the breast".

Dr. Claude E. Welch has succeeded Dr. Grantley W. Taylor as Chairman of the Tumor Board at M.G.H.

We were very glad to receive this letter from Capt. David L. Collins, Jr., MC, USAF (*S.* 1955), written from the 3615th USAF Hospital, Craig Field, Alabama:

I am chief of surgery at a modest-sized hospital at Craig Air Force Base, Alabama, serving a population of about 6,000. Nearly 90% of our patients are dependents, so a large part of the surgery I do is in pediatrics and gynecology. I also take a turn in obstetrics and do a few Cesareans.

We are enjoying our brick duplex home at 94 B, Pine Glen Apartments, Selma, Alabama; the weather (wonderful during the cold months and tolerable during the summer because of complete home and hospital air conditioning): more free time (on duty every 9th night and week end); getting paid; and, last but not least, our 8 pound 1 ounce boy, Li'l' Davey, born October 18.

Best wishes to all our MGH friends.

It was very good to receive this letter from Capt. Arthur E. Baue, MC, USAF (a.r.s.), written from the 6208th USAF Hospital, APO 74, c/o Postmaster, San Francisco, California. The letter was written on October 28. In light of the now completed elections in the Philippines, it is interesting to read what Capt. Baue says regarding the then forthcoming balloting.

My wife and I had a very pleasant 18-day cruise from San Francisco to Manila, via Hawaii and Guam. We are now at Clark Air Force Base in mid-Luzon, about 50 miles north of Manila. This is in the middle of what was once Huk territory round Mount Arayat. The Huk uprising has practically disappeared or been crushed, so it is no longer considered a problem.

It is now just 2 weeks before the Philippine national election, and the authorities are busy confiscating firearms in hopes of preventing an uprising following the death of Magsaysay. Most candidates are claiming to be his political heir.

The hospital here is quite adequate and serves all military services in the South Pacific from Burma over to Borneo and up to Okinawa. The bombing victims from Saigon arrived here shortly after the incident.

Best wishes to all at the M.G.H.

This letter has come from Dr. Hubert A. Shaffer (a.r.p. *R.* 1932), our "singleton" in Morgantown, West Virginia:

Since leaving M.G.H., early in 1933, I have been practising in West Virginia, my home State. I practise radiology in Morgantown, doing most of my work at the Monongalia General Hospital, but I also do the medical radiology for the student health service of West Virginia University which is located here. (Our football team invaded Boston in October and beat Boston University 46-6! Please excuse the bragging, for West Virginia University is my alma mater.) Morgantown is less than sixty air miles south of Pittsburgh, with which our airport has commercial air service.

I married a Miss Love, from Virginia, and we have two sons. The older son is a freshman this year in pre-medicine and, if he keeps up the good work he has done so far, he should be in the medical school in a few years. Our younger son is in the ninth grade and doing very well. We all love to go out to swim and play golf at our new Lakeview Country Club. Its wonderful 18-hole championship course was built in a forest and overlooks a beautiful lake several miles long. Our town of about 30,000 people has two private 18-hole courses.

On a 145-acre tract adjacent to the Monongalia General Hospital, West Virginia University is erecting a completely air-conditioned 25 million dollar building with over 3,000 rooms for the medical, dental, pharmacy, and nursing schools—the first in the United States to be all under one roof. The first portion of the building is complete and is occupied by the dental school and the first two years of medicine. The second portion of this building, which will include the teaching hospital and clinic, is under construction. It will be completed in less than three years, at which time the two-year medical school will be expanded to four years and the four-year school of nursing started. In the next few years there will be a great expansion in the teaching personnel needed in all four schools, and then I hope there will be several more MGH-ers in my town!

Capt. Thomas G. Gabuzda, MC, USAF (*M.* 1956) has written us from the 36th Tactical Hospital, APO 132, c/o Postmaster, New York, N. Y. His letter, dated October 18, reads:

Enclosed is a check for subscription to The News. I look forward to the straws of information it will bring, since news from the U.S.A. is no longer easily available.

My present position is as ward officer in the 75- to 100-bed military hospital at the U.S. Air Base in Bitburg, Germany. My chores are strictly in internal medicine, under which domain influenza falls—much to my present dismay! The medical ward averages some 45 to 55 beds. This manages to keep me busy and, in addition, supplies "interesting cases" from time to time.

For approximately 6 weeks after flying over, Stella and I lived in a hotel because of the serious housing shortage here. We are now very happily settled in a new cozy apartment in Bitburg, where 80% of the buildings have been newly built since the destruction of the war.

We have managed to see much of the nearby beautiful Mosel Valley and have cultivated a taste for the local Mosel wine. German beer is second to none. We have already traveled to Switzerland, and are now planning a trip to Denmark and also to Sweden, where I hope to visit Karolinska Hospital in Stockholm. We will then have to dig in for the winter, since the roads in this relatively isolated part of Germany in the Eifel are sometimes hardly safe even for mountain goats, much less for automobiles! At any rate, we are very contented here and look forward to our 2-year stay.

Our warmest regards to all our friends at the M.G.H.

This letter containing Hospital family news has come from Dr. Ernest H. Picard (a.r.p. *N.* 1957). Dr. Picard does not include his military title, and gives as his address 435 Sumner Drive, San Antonio, Texas. His letter reads:

Since I'm stationed at Brooke Army Hospital at Fort Sam Houston, I have seen many old friends here as they come through the Army Medical Service School on their way to becoming G.I. physicians. The most recent was Carl Brownsberger (a.r.p. 1957), who was assigned from here to Korea. Before that, Gil Hermann (*S.* 1955), Quent Stiles (*S.* 1956), Bob Breer (a.r.p. *C.M.* 1957), and Sandy Drescher (clin. & res. fel. *C.M.* 1957) provided pleasant company.

Capt. Gilbert Hermann, MC, USAF (*S.* 1955) has sent us this letter from the 48th Surgical Hospital, APO 59, c/o Postmaster, San Francisco, California:

Just a short note to let you know my address, so that I can keep up on current events at the M.G.H. via The News until I return.

The Army, in its infinite wisdom, decided that I could best serve my country in Korea. That strictly unilateral decision was carried out forthwith and at present I am one of the two surgeons at the 48th Mobile Army Surgical Hospital in Pusan.

The living conditions here are ranked among the best in Korea for two reasons: inside johns and hot and cold running water 24 hours a day. We also have electricity after 10 P.M., when the generators don't break down.

There is much that is ugly and dirty in the Far East, but much more that is fascinating, exotic in its strangeness, and, in Japan at least, esthetically pleasing. To phrase it differently —things could be worse.

This letter, addressed to "all our MGH friends", has come from Dr. Wilma Canada Diner (a.r.p. *Path.* 1951 & r.p. *R.* 1954). Her husband, Jack Diner, is a graduate of our School of Medical Illustration.

I had suspected that I might be a "singleton" in Little Rock, and am very happy to bring you up to date on our activities, as well as to tell you something about the active and growing Medical Center of which we are a part.

After eighteen months in the practice of radiology at St. Luke's Hospital in New Bedford, Massachusetts, I came along with my husband to Arkansas, the "Land of Opportunity", when he was appointed Medical Illustrator at the University of Arkansas Medical Center here in Little Rock. We have bought a home, acquired a son (Bradley Canada, now eight months old), and expect a second child this winter.

Since last September I have been working part time in the Department of Radiology, and now work half time as assistant professor, doing diagnostic work only. The rest of my time is well spent with our home and budding family. Jack is an instructor in the Medical School, and keeps busy at routine illustrating, research projects, exhibits, and books. He is the only artist at the Center, and feels that his excellent background obtained at the Massachusetts General Hospital under the supervision of Mrs. Miller stands him in good stead.

The Medical Center is in new modern buildings on the west side of Little Rock. The hospital was completed shortly before we arrived, and the Medical School this past spring. The Center is architecturally beautifully constructed and is up to date in scientific facilities. A new dormitory for medical students and a research building are planned for the near future. The medical staff is, generally speaking, a young and energetic group, which we think is "going places" academically.

Dr. David Gould, from Johns Hopkins, is Director of the Department of Radiology, and there are two other full-time radiologists besides me. There are seven residents, who receive excellent training and experience in diagnostic and therapeutic radiology and isotopes, with emphasis upon each person's carrying his share of the routine work and encouragement to participate in clinical or basic research and clinical procedures within the department. The diagnostic division includes four fluoroscopic-

PHOTOGRAPH OF A PORTRAIT OF DR. W. JASON MIXTER
THE PORTRAIT WAS DONE BY ARTHUR POLONSKY, AND HANGS IN THE CONFERENCE ROOM ON THE MIXTER FLOOR OF THE WARREN BUILDING. THE PHOTOGRAPH WAS TAKEN BY FRANK T. MCCARTHY OF OUR PHOTOGRAPH LABORATORY.

radiographic units, an Elema biplane angiocardiographic unit, a Siemens tomographic unit, and four conventional radiographic units. On the therapy side are a 900 curie cobalt^{60} unit, a 220 KV deep therapy, and a 120 KV superficial machine, as well as a strontium applicator, and intracavitary and interstitial cobalt^{60} sources. An isotope laboratory is equipped for all diagnostic and therapeutic procedures and research, with the services of a full-time physicist.

The Medical, Pediatric, and Surgical Services are very active and academic interest is high. The hospital now uses about 300 beds and plans to have about 500 in use in the foreseeable future. The Out-Patient Clinic recorded 67,883 visits during the last fiscal year.

Incidentally, only residents of Arkansas (those living with parents or employed here for at least one year, but not students or armed forces personnel) are considered for entrance into the Medical School. This rule, we hope, will eventually be changed.

Little Rock, the capital of Arkansas, has a population of about 110,000. It is the commercial center and only large city in the State. The basis of its economy is surrounding cotton, corn and rice farming, beef-cattle breeding, bauxite mining, and other diversified smaller industries. The Little Rock Air Force base has recently added considerably to the city's income. The climate is moderate, though the summers seem very hot compared with those of New England. The winters are mild. There was no snow last year.

Culturally, one can take in the Community Concert Series of visiting artists, performances of the Little Rock Philharmonic Orchestra (a fairly new group), an art club at the Museum of Fine Arts, or the Community Theatre. There is much enthusiasm for the University of Arkansas Razorbacks, several of whose football games are always played in Little Rock. Medical School dances and frequent picnics and barbecues are well attended. We have joined a Great Books discussion group, and there are other similar groups. The Little Rock Junior College has recently become Little Rock University with the addition of the third and fourth college years, and a variety of courses are offered in the evening section. Arkansas is a land of wide open spaces as compared with the northeast, traffic is much less a problem, and standing in line for shopping or entertainment tickets is unusual. The Ozark Mountains area is within easy reach for vacationers. Of course, a lover of the seacoast finds it missing among the attractions out here.

I think this just about covers the situation except to say that we miss the M.G.H., Boston, and New England, and some day will pay you a visit with our family.

Best regards from Jack.

This interesting letter has come from Dr. William N. ("Nick") Jones (a.r.s. *Or.* 1954), our "singleton" in New London:

My growing family, consisting of a wife, a baby daughter, and a dog, are happily ensconced in the seaport town of New London, Connecticut, where I commenced private practice in orthopedics in January 1956. My work takes me across the State line into Rhode Island almost daily, where I am on the consulting staff at the Westerly Hospital, and once a week up to the Newington Home and Hospital for Crippled Children near Hartford. This is a well administered orthopedic hospital, staffed by orthopedic surgeons from throughout the State. Its physical facilities, combined with a well trained resident staff, are capable of providing the best of orthopedic management. My patient responsibilities seem to increase with the lapse of time, and each month I find I am traveling in larger and larger circles. Nevertheless, I am thoroughly enjoying the adventures that this type of specialty affords.

This geographical area makes a great appeal to me because of its remarkable variety. The country on all sides of New London and Westerly is picturesque in all seasons of the year. The staid character of rural New England life, which is strongly affected by the proximity of the sea with its numerous attractions, blended with the less appealing influences of expanding industry and growing population, combine to provide this region of New England with a unique versatility which makes it a good place in which to live the year round.

Both New London and Westerly are busy towns, well supplied with doctors; and the specialties are likewise well represented except for some of the surgical specialties—notably neurosurgery. However, on the rare occasions when outside medical assistance is needed, Providence and Boston on the one side and New Haven and New York on the other are near enough.

My wife and I recently acquired an old house (1740) in Old Mystic, which we call "Backachers", midway between New London and Westerly. We are painfully restoring it and hope to occupy it as our home in about a year's time. This will place me within twenty minutes' driving time of both local hospitals and only ten minutes away from my New London office.

To all of my MGH friends who take the trouble to read this I extend my personal greetings and invite you to stop by for a visit at any time when you are traveling along this section of the eastern Connecticut shore.

Dr. John W. Bell (*E.S.* 1946) has sent us this letter from the Veterans Administration Hospital, 4435 Beacon Avenue, Seattle 8, Washington:

Thank you very much for your recent follow-up letter. In order to bring your records up to date: I left Boston in December 1953 and spent 2 1/2 years at the Veterans Administration Hospital in Sunmount, N. Y., as Chief of the Surgical Service. This was an interesting and valuable experience.

In the summer of 1956 I left Sunmount to take up residence at the other corner of the country, i.e., Seattle, Washington. This is my home town, and I finally made it back after 14 years in Chicago, Boston, and New York State.

Seattle is a thriving medical community, with many MGH-ers. At present I am directing the Surgical Service at the Seattle Veterans Administration Hospital, and am Assistant Professor of Surgery at the University of Washington School of Medicine.

Am always glad to hear from you.

No. 173 Boston, Mass. JANUARY 1958

ELECTRON MICROSCOPY AT M.G.H.

The rather recent development of the electron microscope and its application to the study of biological and medical problems represent one of the most exciting advances in science. The reason the electron microscope is of such tremendous value to the biological or medical investigator is because it is capable of resolving (visualizing) very small objects, thus producing useful magnifications up to about one million times. This may be contrasted with the conventional light microscope, whose range of useful magnifications extends at the most to only several thousand diameters.

Electron and light microscopes are very similar in principle. They both produce direct magnified images by means of a series of lenses. What, then, is the reason for the far greater resolving power (i. e., useful magnification) of the electron microscope? The answer is very simple. Whereas the visible light waves used in illuminating the light microscope are relatively long, the corresponding electron beam used in the electron microscope has a very short wave length. Inasmuch as the resolving power, or the ability to magnify usefully, of an optical instrument is greater the shorter the wave length of the illuminating beam, it is obvious that the electron microscope can visualize far smaller objects than can the light microscope. A beam of electrons is, of course, invisible as such to the human eye but can be made visible by allowing it to strike a fluorescent screen. This is what is done in the electron microscope to produce a visible image of the object and is quite analogous to the formation of a picture in a television set. The image may, of course, be photographed also.

There are two other features of the electron microscope as compared with those of the light microscope which should be mentioned. One of these concerns the nature of the lenses employed. The familiar glass lenses of the ordinary microscope are opaque to electrons and thus cannot be used in electron microscopes. Electrons are charged particles and their paths can be altered by means of electrical or magnetic fields. Accordingly, most electron microscope lenses are no more than magnets which, by appropriately changing the direction of the electron beam, produce magnified images in much the same way that glass lenses alter the path of visible light to form images in the light microscope. The other feature of the electron microscope which we shall mention is the fact that it will operate only if there is a vacuum (as in a television picture tube) along the course of the electron beam. This is one disadvantage, because it precludes the examination of living cells or tissues.

The field of electron microscopy is in its infancy, having only begun as recently as the early 1940's, and there are still many problems to be overcome regarding the preparation of materials to be examined. Nevertheless, in a relatively short time the electron microscope has already brought to light an enormous amount of information regarding the ultrastructure of cells and tissues.

For the first time the intimate details of muscle, nerve, and other cell structures which are beyond the scope of light microscopy have been seen. The visualization of the formerly invisible viruses is now routine. In some instances even the individual molecules of some biological components have been photographed under the electron microscope. A sufficient amount of information regarding normal cells and tissue components has now accumulated to enable workers to start studying those changes occurring in disease which cannot be seen with the light microscope. It is anticipated that the examination of abnormal tissues with the electron microscope will reveal at least as much more information over and above that obtained by the light microscope as the latter discloses in comparison with gross visual examination.

A number of departments at the Massachusetts General Hospital have recognized the importance of the electron microscope in research to the extent that the Hospital now has three separate electron microscopy laboratories. These laboratories are working on varied problems, which serves to emphasize the manifold applications of this powerful new technique. Another reason for the great interest in electron microscopy in this institution stems from the close relationship between the Hospital and Professor Francis O. Schmitt's biology laboratories at the Massachusetts Institute of Technology. Dr. Schmitt, who is an Institute Professor at M.I.T. (and a member of the Board of Trustees of the Massachusetts General Hospital), has pioneered in the application of the electron microscope in the biological sciences as well as in the training of scientists in this field, including several of those now working at the Hospital.

The oldest electron microscope laboratory at the Hospital is an integral part of the Arthritis Unit in the Research Building and is under the direction of Dr. Jerome Gross. Dr. Gross has been studying the very important and ubiquitous protein collagen, which makes up such a large proportion of the structural framework of the human body. In collaboration with Dr. Schmitt he has studied, over the past few years, the basic structure and properties of collagen. At present he is investigating the mechanisms of formation and breakdown of connective tissue.

The second electron microscope laboratory is within the Department of Pathology in the Edwin S. Webster Laboratory. Here Dr. Spiro is studying the structure of kidneys in both normal and diseased states by examining very thin sections of tissue under the electron microscope. It is anticipated that this method of approach will result not only in advancing our fundamental knowledge of kidney disease but will also aid clinicians in the diagnosis of obscure renal ailments.

The newest electron microscope laboratory is located in the Mixter Laboratories for Neurosurgical Research in the Warren Building. The research program which will be undertaken here involves the study of the nervous system with the electron microscope in order to obtain more fundamental knowledge regarding its function and fine structure. It is hoped that results obtained will help to clarify some of those changes which occur in pathological conditions.

In closing it might be mentioned that the setting up of an electron microscope laboratory is no inconsiderable undertaking. The training necessary to produce a competent electron microscopist is highly specialized and, accordingly, qualified personnel are in great demand. The cost of an electron microscope is in the vicinity of $30,000, and the required ancillary equipment costs perhaps as much. It should be noted in this connection that the U.S. Public Health Service provided a large part of the funds for the equipment in these laboratories at the Massachusetts General Hospital.

It is the conviction of those working in this field that the costs mentioned above are insignificant in view of the tremendous potentialities of the technique. Indeed, we are at the brink of a new era in scientific discovery, much as investigators of the last century were when employing the light microscope for the first time.

David Spiro, M.D.,
Assistant Pathologist

* * *

The Government of Ecuador has conferred the Order of Merit on Dr. Paul D. White, in appreciation of his having started the Ecuadorian Cardiological Society.

Dr. Joseph S. Barr received the Presidential Award from the Fourth International Poliomyelitis Conference of the International Poliomyelitis Congress this past summer, in appreciation for his participation in the Conference held in New York.

Dr. Madelaine R. Brown was honored as Medical Woman of the Year by the New England branch of the American Medical Women's Association, at the meeting of the Association held in Dallas, Texas, in November.

Dr. Laurence L. Robbins was elected President-elect at the annual meeting of the Radiological Society of North America, held in Chicago in November. Dr. Robbins will assume this new office in November 1958.

* * *

At a tea, given in the Warren Building on October 22 in honor of Dr. Chester M. Jones, a Lecture Fund established in his name and an oil portrait of Dr. Jones were presented to the Hospital. The presentation speech was made by Dr. Daniel S. Ellis, on behalf of the large number of professional colleagues, students, patients, and friends of Dr. Jones who had helped to make these gifts possible. Mr. Francis C. Gray, Chairman of our Board of Trustees, accepted the gifts on behalf of the Hospital. Dr. Walter Bauer spoke of Dr. Jones's contributions to the Hospital, the Harvard Medical School, and to American medicine. In closing, Dr. Jones expressed his appreciation and gratitude for the recognition which had been shown him.

The Board of Trustees, at their meeting on November 8, voted to appoint:

Dr. Frank K. Austen as Resident in Medicine for one year, beginning July 1;
Dr. Lloyd Caplan as Resident in Psychiatry at McLean Hospital, beginning October 1;
Dr. Roman W. DeSanctis as Assistant Resident in Medicine for one year, beginning July 1;
Dr. Thomas E. Gaffney as Assistant Resident in Medicine for one year, beginning July 1;
Dr Alan H. Goldberg as Assistant Resident in Anesthesia, beginning July 1;
Dr. Peter J. Gomatos as Assistant Resident in Medicine, for the period July 1, 1958 through December 31, 1958, and as Resident in Medicine for the period January 1, 1959 through December 31, 1959;
Dr. Mehran Goulian as Assistant Resident in Medicine for one year, beginning July 1;
Dr. Robert H. Jones as Resident in Medicine for one year, beginning July 1;
Dr. Walter Kaupe as Resident in Psychiatry at McLean Hospital, beginning July 1;
Dr. David M. Klein as Second Assistant Resident in Neurosurgery, assigned to Neurology, for the period January 1 through August 31;
Dr. Jan Koch-Weser as Resident in Medicine for one year, beginning July 1;
Dr. Donald B. Martin as Resident in Medicine, for a period of six months, beginning July 1;
Dr. Richard F. Mayer as Assistant Resident in Pathology, assigned to Neuropathology, for a period of six months, beginning January 1;
Dr. Egbert H. J. Mueller as Resident in Psychiatry at McLean Hospital, beginning July 1;
Dr. Herbert A. Newman as Second Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. Jack Rice as Resident in Psychiatry at McLean Hospital, beginning July 1;
Dr. Harvey D. Rothberg, Jr. as Resident in Medicine for one year, beginning July 1;
Dr. Richard V. Wilson as Assistant Radiologist, for the period November 25, 1957 through June 30, 1958;
Dr. Herbert Wohl as Assistant Resident in Medicine for one year, beginning July 1.

At their meetings on October 30 and November 13, 20, and 27, the General Executive Committee voted:

To promote:

Dr. William R. Blade to the position of Resident in Radiology for one year, beginning January 1;
Dr. Alexander Breslow to the position of First Assistant Resident in Pathology for one year, beginning July 1;
Dr. Harold T. Dillon, Jr. to the position of Third Assistant Resident in Pathology for one year, beginning July 1;
Dr. Ira A. Ferguson, Jr. to the position of First Assistant Resident in Surgery, beginning January 1;
Dr. Robert S. Harper to the position of First Assistant Resident in Pathology for one year, beginning July 1;
Dr. Betty J. McClellan to the position of Third Assistant Resident in Pathology for one year, beginning July 1;
Dr. Robert B. McFarland to the position of Second Assistant Resident in Pathology for one year, beginning July 1;
Dr. John Mealey, Jr. to the position of First Assistant Resident in Neurosurgery, for the period January 1 through August 31;
Dr. Richard C. Packert to the position of Resident in Radiology for one year, beginning January 1;
Dr. John T. Pollard, Jr. to the position of First Assistant Resident in Radiology for one year, beginning January 1;
Dr. Sanford I. Roth to the position of Second Assistant Resident in Pathology for one year, beginning July 1;
Dr. Richard L. Rovit to the position of Resident in Neurosurgery, for the period January 1 through October 31;
Dr. R. Neal Schneiderman to the position of Resident in Dermatology, beginning November 1, 1957;
Dr. Giles D. Toll to the position of Second Assistant Resident in Pathology for one year, beginning July 1.

To reappoint:

Dr. Clive B. Cameron for one year, beginning November 15, 1957, with a change of title to Clinical and Research Fellow in Medicine;
Dr. G Richard Dickersin as Clinical Fellow in Pathology for one year, beginning July 1;
Dr. Robert E. Key as Assistant Resident in Orthopedic Surgery for one year, beginning November 23, 1957;
Dr. Marie-Louise Levy as Clinical and Research Fellow in Anesthesia for one year, beginning October 29, 1957;
Dr. Joseph D. Sabella as Clinical Fellow in Pathology for one year, beginning July 1;
Dr. Dagoberto Sosa as First Assistant Resident, assigned to Neuropathology, for the period January 1 through August 31;
Dr. Douglas G. Tompkins as Assistant Resident in Orthopedic Surgery, assigned to the Lemuel Shattuck Hospital, retroactive to July 1, 1957, and to promote him to the position of Senior Resident in Orthopedic Surgery, beginning January 1, 1958.

To appoint:

Dr. Károly Balogh as Research Fellow in Pathology for one year, beginning May 1;
Dr. Raymond N. Kjellberg as Clinical and Research Fellow in Neurosurgery, for the period October 1, 1957 through December 31, 1957, and to promote him to the position of Senior Resident at the Veterans Administration Hospital, for the period January 1, 1958 through August 31, 1958;
Dr. Pierre Lazorthes as Clinical Fellow in Anesthesia, beginning approximately December 1;
Dr. Yosh Maruyama as Clinical and Research Fellow in Radiology for one year, beginning July 1;
Dr. Roger Simoneau as Graduate Student Assistant in Orthopedic Surgery, for a period of eight weeks, beginning October 28, 1957;
Dr. John B. Stokes as Clinical and Research Fellow in Medicine for one year, beginning January 1.

The General Executive Committee also voted to assign Dr. Robert G. Ojemann to the Veterans Administration Hospital as Junior Resident, for the period January 1 through August 31.

* * *

THE MIXTER NEUROCHEMISTRY LABORATORY

If one accepts the assumption that the brain is the seat of the mind, then its physical and chemical functioning becomes of particular interest as it defines, at least in one dimension, the potentialities and limitations of our mental performance. This consideration applies in both health and disease, and it is, of course, by no means new. The widespread use, among the healthy population, of such things as coffee, alcohol, barbiturates, and tranquilizers attests to the general recognition of the interrelationship between soma and psyche and indicates how commonly we attempt to modify the state of our minds through an effect on the function of our brains.

In the realm of disease, there are many afflictions (i.e., vascular, neoplastic, degenerative) that are clearly the result of pathology in the brain as an organ. Their prophylaxis, diagnosis, and treatment may be expected to improve as we gain a better understanding of certain of the chemical mechanisms involved. Perhaps of even greater importance is the large, heterogeneous group of illnesses characterized by deficiencies in intellectual and emotional performance. A few of these so-called "mental illnesses" are known to be primarily the result of derangements at the chemical level. There are probably others in which a partial chemical defect plays a contributory or permissive role in the etiology. In others of clearly psychogenic origin, physical and pharmacological manipulations may be important adjuncts to therapy. Our present knowledge of what is happening in this general area is, at best, fragmentary.

Considerations such as the above have led to the current interest in neurochemistry and indicate its enormous scope as an area for research. The Mixter Neurochemistry Laboratory operates within this general context. Studies which are complementary to other research activities going on on the floor and studies which may contribute toward the solution of problems confronting the neurosurgeon (such as the control of cerebral edema or the localization or chemotherapy of brain tumor) are of particular interest to the laboratory. At the same time it is hoped that basic information will be acquired that will contribute to a better understanding of functional neurochemistry in general.

The laboratory is currently devoted to problems of electrolyte metabolism in nervous tissue. The movements, in and out of nerve cells, of charged particles such as sodium, potassium, calcium, magnesium, chloride, and phosphate ions are of particular interest because these movements have been shown to be responsible for the electrical phenomena so characteristic of nerve cell function. Conditions which affect these ionic movements may thus be expected to have a rather direct effect on nerve function. We are interested in studying the effects of hormones, drugs, and other substances which may be present in body fluids.

Since water accompanies the movement of solute particles, it is hoped that these studies will throw some light on the important clinical problems of cerebral edema. It is further hoped that some of the information acquired about the distribution of these inorganic electrolytes in nervous tissue will be applicable to the distribution of compounds useful in the diagnosis and treatment of tumors.

Most of the studies are performed on nervous tissue excised from anesthetized animals and kept alive in an artificial medium. We expect also to analyze small samples of human brain removed for therapeutic reasons at operation or obtained at post-mortem.

In order to be able to observe changes in specific, small areas of the nervous system, the analyses are performed on a micro scale. As the amount of material being analyzed diminishes, the relative importance of contaminating substances increases. This fact is responsible for what are perhaps the only distinctive physical features of the laboratory. In order to eliminate the contamination resulting from sodium and calcium dissolving out of glass containers, the laboratory glassware has been largely converted to plastic containers and special cleaning apparatus has been developed.

The laboratory has been extremely fortunate in regard to its physical layout and equipment. In addition to a complete complement of the standard facilities required for the efficient operation of a modern chemical laboratory, it is provided with a warm room for the isolation and incubation of living tissue specimens.

The location of the laboratory is particularly advantageous. It is in immediate proximity to other laboratories on the floor which are studying the same general problem via quite different methodological approaches. These include electron microscopy, electrophysiology, ultrasonics, histology, isotopic techniques, and organic chemistry. Furthermore, it is within easy reach of the laboratories of neuropathology, neurology, and psychiatry on the floors below and above. It is hoped that this unusual physical proximity of these related groups will lead to a cross-fertilization of ideas and productive collaboration.

The work of this laboratory is being pursued by the author, and Miss Frances B. Nesbett whose qualifications include an M.A. in chemistry and extensive experience in this type of research, and Dr. Yasuso Tsukada of Keio University who is with us for a year on a Rockefeller Fellowship. Dr. Tsukada has published a number of papers from Japan on the functional chemistry of the brain.

As one of the most recent additions to the research laboratories of the M.G.H. the Neurochemistry Laboratory is aware with something of a sense of obligation, that it is joining a group distinguished by a tradition of productive research.

Adelbert Ames, III, M.D.,
Associate Biochemist in Neurosurgery

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

General Medicine

Anderson, E. P., Kalckar, H. M., Kurahashi, K., and Isselbacher, K. J.
A specific enzymatic assay for the diagnosis of congenital galactosemia. I. The consumption test.
J. Lab. & Clin. Med. 50:469-477.

Isselbacher, K. J.
Clinical and biochemical observations in galactosemia.
Am. J. Clin. Nutrition 5:527-532.

Isselbacher, K. J.
Evidence for an accessory pathway of galactose metabolism in mammalian liver.
Science 126:652-654.

Kennedy, B. J., Kelley, R. M., White, G., and Nathanson, I. T.
Surgery as an adjunct to hormone therapy of breast cancer.
Cancer 10:1055-1075.

Sisson, J. H.
Periodic examination of well patients.
In M. Clin. North America, vol. 41, no. 5, Philadelphia, W. B. Saunders Company, pp. 1439-1449.

General Surgery

Waddell, W. R.
The acid secretory response to histamine and insulin hypoglycemia after various operations on the stomach.
Surgery 42:652-658.

Laboratory Science

Waddell, W. R., and Geyer, R. P.
Effect of insulin on clearance of emulsified fat from the blood in depancreatized dogs.
Proc. Soc. Exper. Biol. & Med. 96:251-255.

Neurology

Brown, M. R.
The earliest description of paralysis due to multiple neuritis following diphtheria.
Bull. Hist. Med. 31:375.

Neurophysiology

Brazier, M. A. B.
Electroencephalographic studies of flicker in normal man.
In ERDL-Tulane Symposium on Flicker, U.S. Army Engineer Research & Development Laboratories Report, pp. 199-224.

Brazier, M. A. B.
Electroencephalography.
In Progress in neurology and psychiatry, vol. 12, chap. 13, New York, Grune & Stratton.

Ophthalmology

Mangiaracine, A. B., and Liebman, S. D.
Fungus keratitis (Aspergillus fumigatus): Treatment with nystatin (Mycostatin).
A.M.A. Arch. Ophth. 58:695-698.

Books

Short, C. L., Bauer, W., and Reynolds, W. E.
Rheumatoid arthritis: A definition of the disease and a clinical description based on a numerical study of 293 patients and controls.
Cambridge, Mass., Harvard University Press.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. LeRoy A. Schall, Chief of Otolaryngology at the Infirmary, was elected President at the October meeting of the American Academy of Ophthalmology and Otolaryngology, held in Chicago. Over 5,000 members gathered to participate in the 346 courses that were conducted by a faculty of 398 instructors.

The Academy, whose membership numbers over 6,500 certified ophthalmologists and otolaryngologists, is the largest special society of its type in the world. Originally established as a training center, the group is dedicated to the education of its members. Its prime function is to raise the standards of its specialties. Besides the symposium-type meetings, the Academy conducts home study courses, and has sponsored the publication of such works as an atlas of otolaryngological pathology and one of ophthalmological pathology.

On November 4, Dr. Schall left for Hawaii to present papers at a meeting of the Pan-Pacific Surgical Society. On November 23, he flew to Japan to represent the U.S. Air Force Medical Corps at a conference sponsored by the Japanese members of the Pan-Pacific organization.

TINNITUS RESEARCH LABORATORY

Anyone who has ever had a slight ringing in his ears for even a few minutes and can imagine this sound magnified several times, constantly present and with no prospect of relief, will have some comprehension of the symptom called tinnitus. For years this extremely annoying symptom has eluded the efforts of otologists to establish its cause or causes and has equally eluded efforts to discover an effective treatment.

In April of 1956 the Tinnitus Research Laboratory was set up under the support of a grant from the Research Committee of the Massachusetts Eye and Ear Infirmary to further study the tinnitus problem. The primary purpose of establishing the laboratory was to study the possible therapeutic effect of loud noise on tinnitus. Since it has been shown by animal experimentation that portions of the inner ear or cochlea can be selectively damaged or destroyed by the use of loud noise, it was felt that if the source of sound in some patients' tinnitus could be localized to a portion of the inner ear, then it might be possible by the use of loud noise to selectively damage or destroy this portion of the cochlea and thereby alleviate or eradicate the ringing. Through the assistance and advice of Dr. J. Zwislocki, then of the Harvard Psycho-Acoustic Laboratories, electronic equipment was assembled which enabled us to ascertain the frequencies or tones involved in the patient's tinnitus and thereby determine the source of tinnitus. In general, this is done by performing extensive pure tone and speech audiometric testing to accurately determine the extent of the patient's hearing loss. The patient's noise is then duplicated by creating mechanically noises of known frequency content. The almost innumerable possible combinations of frequencies make this a rather long and tedious task, but it has been found that with patience it is possible to almost exactly duplicate the patient's noise in most cases. By these measures and other testing procedures it is possible to determine quite accurately whether the ringing originates from the inner ear and, if so, from what part. Also, from this information it is then possible to select or determine the frequency or tone of the noise which might be expected to influence the ringing. Fortunately, most tinnitus is of a high-pitched nature involving the frequency of sound not needed by the ear for speech reception and, also, it is usually accompanied by a rather severe hearing loss involving the frequencies concerned in the tinnitus. This makes it possible in most cases to employ the damaging effects of loud noise in the frequencies involved in the ringing without unduly damaging the patient's everyday hearing.

The patients used in this study have been recruited from the ENT Clinic on a volunteer basis, and the supply of patients to date has been abundant. The results regarding the therapeutic effect of noise were at first discouraging, but the coincidental findings with regard to: audiometric findings in patients with tinnitus, the effect of extremely loud noise on human ears, and the possibility of developing testing procedures to determine the actual site of origin prompted a continuation of the program. As time went on and the methods of producing and applying the loud noise therapeutically became more refined and more vigorous (we are now using sound intensities in the neighborhood of 130-140 decibels, which is comparable to the noise 50 feet from the tail of a jet plane at take-off), the therapeutic possibilities became more encouraging. In view of these results and the possible importance of allied information obtained, in April of 1957 a 3-year research grant was obtained from the Institute of Neurological Diseases and Blindness of the U.S.P.H.S. for further study of tinnitus from this approach.

To date, approximately 300 patients with tinnitus have been studied in the laboratory. Although nothing dramatic, therapeutically, has emerged from the study as yet, it appears that loud noise can be safely used and is capable of affecting tinnitus in some cases, at least temporarily. It is planned to continue the audiometric study of patients with tinnitus, as well as the effect of loud noise on hearing and tinnitus.

George F. Reed, M.D.,
Assistant Surgeon in Otolaryngology
and *Assistant to the Chief of Otolaryngology*

BIOGLETS

Dr. Richard F. Bedell, Intern on the Children's Medical Service—born in New York City, November 3, 1931; A.B., Duke University, Durham, North Carolina, 1953; M.D., Duke University Medical School, March 1957; Fellow in the Department of Allergy, Duke Hospital, March-June 1957; married; home: Scarsdale, N. Y.

Dr. Henry N. Claman, Assistant Resident in Medicine—born in New York City, December 13, 1930; A.B., Harvard College, 1952; M.D., New York University, 1955; Intern and Assistant Resident in Medicine, Barnes Hospital, St. Louis, 1955-57; married; one daughter; home: New York City.

Dr. John P. Connelly, Assistant Resident on the Children's Medical Service—born in Boston, Massachusetts, May 12, 1926; graduated from English High School, Boston, 1942; Private in the U.S. Army Air Corps, 1943-46; B.S., Boston College, 1952; M.D., Georgetown University, Washington, D. C., 1955; Intern, Royal Victoria Hospital, Montreal, Canada, 1956; Captain, U.S. Air Force, 1956; married; three children.

Dr. Daniel Deykin, Intern in Medicine—born in New York City, October 29, 1932; A.B., Harvard College, 1953; M.D., Harvard Medical School, 1957; married; temporary home: Cambridge, Massachusetts.

Dr. David A. Drachman, Assistant Resident in Neurology—born in New York City, July 18, 1932; A.B., Columbia University, 1952; M.D., New York University-Bellevue Hospital, 1956; Intern in Medicine, Duke Hospital, Durham, North Carolina, 1956-57; Inactive Senior Assistant Surgeon, USPHS (NIH), Bethesda, Maryland.

Dr. M. Judah Folkman, Intern in Surgery—born in Cleveland, Ohio, February 24, 1932; B.A., Ohio State University, Columbus, Ohio, 1953; M.D., Harvard Medical School, 1957; home: Columbus, Ohio.

Dr. H. David Hall, Intern in Dentistry—born in Henryetta, Oklahoma, May 15, 1931; B.S., University of Oklahoma, 1953; D.M.D., Harvard School of Dental Medicine, 1957.

Dr. Timothy S. Harrison, Assistant Resident in Surgery—born in Kodaikanal, South India, July 13, 1927; A.B., Hope College, Holland, Michigan, 1949; M.D., Johns Hopkins Medical School, 1953; Resident, Johns Hopkins Hospital, 1953-56; Research Fellow in Surgery, Massachusetts General Hospital, 1956-57.

Dr. John B. Herrmann, Intern in Surgery—

born in Cincinnati, Ohio, November 21, 1932; A.B., Dartmouth College, Hanover, New Hampshire, 1954; Certificate in Medicine, Medical School, Dartmouth College, 1955; M.D., Harvard Medical School, 1957.

Dr. Jeannette A. Hovsepian, Assistant Resident in Radiology—born in Philadelphia, Pennsylvania, August 28, 1930; B.A., Barnard College, New York, N. Y., 1952; M.D., College of Physicians and Surgeons, Columbia University, 1956; Intern, rotating, University of Illinois Hospitals, Chicago, 1956-57.

Dr. Howard S. King, Assistant Resident on the Children's Medical Service—born in Boston, Massachusetts, April 2, 1931; graduated from Boston Latin School, 1948; A.B., Harvard College, 1952; M.D., Boston University School of Medicine, 1956; Intern in Medicine, Massachusetts Memorial Hospitals, 1956-57; home: Brookline, Massachusetts.

Dr. Herbert J. Levine, Assistant Resident in Medicine—born in Boston, Massachusetts, July 22, 1928; graduated from Governor Dummer Academy, 1946; A.B., Harvard College, 1950; M.D., Johns Hopkins Medical School, 1954; Intern in Medicine, Peter Bent Brigham Hospital, Boston, Massachusetts, 1954-55; Senior Assistant Surgeon, USPHS, Endocrinology Section, National Cancer Institute (NIH), Bethesda, Maryland, 1955-57.

WESTERN WATER

After a summer of drought in Massachusetts, it may not be inappropriate to compare our plight with that of another section of our country which is very familiar with this difficulty. The problem of water supply is prevalent throughout most of the Western States, and is one with which my native land of Colorado has been struggling perennially for its 71 years of statehood. The situation is expressed simply in a maxim, familiar in the West: "The land is worth the water you can get to it."

The reason for this condition can be dramatically revealed by any aerial view of the potentially fertile plain. Half of it is brown and nonproductive, the other half is lush green, and a clean straight line separates the two. On closer inspection, we see that the dividing line is an irrigation canal.

Colorado's water problem is due mainly to its geographical make-up. The eastern portion of the State is an extensive plain which is capable of great production, but which lies mostly quite arid. The western part consists of a massive bulwark in the form of the Southern Rocky Mountain chain. An accompanying factor is the meteorological situation. Water-bearing clouds, originating in storms off the California coast, are intercepted by the Rocky Mountain rampart (including 52 peaks which tower to an elevation exceeding 14,000 feet) before they can reach the parched farm lands in eastern Colorado. The result is that rain and snow precipitate in the mountains on the western side of the Continental Divide and do not reach the thirsting prairies farther east.

While it was the powerful lure of gold and silver which first brought people to this area, today its principal industries are farming and cattle-raising. Unless the uranium and oil shale resources exceed present expectations, its economic welfare will continue to rest chiefly on the agricultural wealth of the area. But the farms can't produce without water.

Of course, some of the precious commodity finds its way over the mountain wall, and it is largely this water which has sustained the present farming of the eastern plains. Much of this precipitation is found in the myriad of small mountain lakes, nestling beneath the Continental Divide on the short eastern slope of the Rockies. An indication of the keen competition for water is given by the realization that every cupful in these isolated mountain pockets is spoken for by a farmer somewhere to the east before the water even begins its turbulent trip down 40 miles of stream to the plains.

Being an ingenious creature, man has found ways of moving some of the western slope water through the mountains to fields on the opposite side by using miles of tunnels. Most of these tunnels have been drilled with the express purpose of carrying water. One of the largest of these is the Big Thompson Project.

But man's resourcefulness goes further. In 1927 Colorado opened this country's second longest railroad tunnel—the Moffat. To drill a tunnel of this size through 6.2 miles of hard rock beneath the Continental Divide, it was necessary to have a smaller, parallel, or "pioneer" bore, connected intermittently with the main tunnel, to be used for logistical needs or in the event of "cave-ins". When railroading interests had completed the principal tunnel, the pioneer bore was temporarily idle. But not for long. The pressing need for water soon converted the smaller tunnel to a conduit for the precious liquid, and today progressively more and more water is being shunted through this channel to the eastern plains.

As might be expected, the conflict between individuals for water has expanded to interstate rivalries. The headwaters of the Colorado River rise on the western slope of the Colorado Rockies. Heretofore much of this water has been used without dispute by the city of Los Angeles, via the Boulder Dam. But now Colorado is beginning to tap this supply of water by conveying it to the eastern slope, and the rightful ownership of this water has become a major political issue for Colorado.

While it has been primarily the rural interests which have been keenly aware of the water lack, the paucity has made itself felt to the urban dwellers as well. In the past 10 years the population of Denver has doubled — 350,000 to 700,000. With the growth there has not only been this rapid large influx of people, but simultaneously a number of small industrial plants have appeared. These industries, as well as the population growth, have created a water shortage which has necessitated water rationing. Citizens are now required to limit radically the amount of water used to maintain lawns and gardens—such watering often being limited to a very few hours a week. This rationing is enforced by law as vigorously as the traffic regulations or other measures for safe community living. The result has been that a city, previously remarkable for its fine gardens, is becoming noted for its sunbrowned lawns.

In a less overt way Denver has felt the problem for many years. The water supply has never been adequate to meet the demands of a possible major conflagration. To avoid a potential catastrophe, a city ordinance, passed many years ago, made it mandatory to use noninflammable materials in all buildings. Consequently, brick and stone are used entirely throughout the city, and the frame house is nonexistent.

In terms of everyday living, the citizens of this area are quick to correct a leaking faucet. And the luxury of a prolonged hot shower is significantly curbed by the uncomfortable thought that it requires excessive amounts of the precious necessity.

Colorado claims with pride as a native son one of the foremost contemporary poets—Thomas Hornsby Ferril. With a wonderfully articulate pen, Mr. Ferril has eloquently expressed the problem in the following poem which can be seen today in the rotunda of the State Capitol in Denver:

Here is a land where life is written in water.
The West is where the water was and is.
Father and son of old mother and daughter
Following rivers up immensities
Of range and desert thirsting. The sundown ever
Crossing a hill to climb a hill still dryer.
Naming tonight a city by some river,
A different name from last night's camping fire.
Look to the green within the mountain cup.
Look to the prairie parched for water lack.
Look to the sun that pulls the oceans back.
Look to your heart and may your wisdom grow
To the power of lightning and to peace of snow.

Giles D. Toll, M.D.,
Assistant Resident in Pathology

VOLUNTEER GROUPS

DISTAFF CLUB

The festivities of the Christmas season are over, but the Distaff Club looks forward to many delightful occasions in the New Year.

The Hospital administration plans to give another tea in January to welcome the incoming House Staff. This will start the year off very pleasantly.

In February, the Distaff Club will meet in area gatherings. These smaller meetings give the members an opportunity to meet those who live in their vicinity. They also offer an excellent chance for those who live some distance from the Hospital to participate in Distaff activities as the Club members meet in their own communities. The areas and their representatives are: Boston — Mrs. Donald M. McKee and Mrs. Fred B. Ballard, Jr.; Newton, Needham, Natick — Mrs. George D. Zuidema; Brookline — Mrs. Gerhard Nellhaus and Mrs. Jack H. Mendelson; Watertown, Concord, Cambridge, Winchester — Mrs. Theodore van Ravenswaay and Mrs. John P. Connelly; Chestnut Hill — Mrs. William E. Karnes. The area representative for Eye and Ear Distaff-ers is Mrs. August Stemmer. Mrs. Sumner I. Zacks is area representative coordinator.

No. 70 in a series of Staff photographs
Dr. Jerome Gross, Associate Biologist (Medicine)—
in charge of the electron microscopy laboratory
in the Research Building

No. 71 in a series of Staff photographs
Dr. David Spiro, Assistant Pathologist—
in charge of the electron microscopy laboratory
in the Department of Pathology

A project recently completed by the Distaff Club was the obtaining of colorful travel posters to use in decorating the psychiatry wards. These posters were hung early in December, and add a bright touch to the walls.

A new interest among Distaff-ers is that of the reading aloud of plays. The group meets every other week. Such works as "Ah, wilderness" and "Anne of a thousand days" have been read. Anyone interested is cordially welcomed to join the group. For further information, get in touch with either Mrs. Alfred E. Miller or Mrs. Charles E. Huggins.

New addresses:—

Dr. Gordon E. Jones (*E.S.* 1939), 108 W. 22nd St., Olympia, Wash.

Dr. Donald P. Pederson (c.r.p. *An.* 1957), Jaegerfborg Alle 203, St., Gentofte, Denmark

Dr. John W. Raker (*E.S.* 1942), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.

Capt. Charles P. Summerall, III, MC, USAR (*M.* 1956), 5th General Hospital, APO 154, c/o Postmaster, New York, N. Y.

Dr. Thomas J. Whitfield, III (*C.M.* 1954), Concord Medical Center, Concord, Mass.

Brief bits:—

Dr. Joseph S. Barr delivered the Robert Jones Memorial Lecture before the Royal College of Surgeons of England on October 31. His subject was "Arthroplasty of the hip".

Dr. Mary A. B. Brazier was invited by the Polish Physiological Society to be their guest at the 7th Congress of Polish Physiologists, held recently in Warsaw.

Dr. Benjamin Castleman was the leader of the Histopathology Workshop on Cancer of the Lung, which was sponsored by the American Cancer Society, at Virginia Beach, on November 7 and 8. The theme of this Workshop concerned the changes in man and the experimental animal associated with exposure to cigarette smoke.

Dr. Earle M. Chapman was a member of the panel which discussed "Problems in thyroid cancer" at the October 28 meeting of the American Cancer Society, held in New York City. Dr. Chapman served as Chairman of the Doctors Committee during the recent United Fund drive.

This interesting bit of information came from Dr. Robert R. Linton: "I participated in the meeting of the American College of Surgeons and the International Society of Angiology, held in Atlantic City in late October. At the latter meeting I had the pleasure of entertaining two Russian anatomists and two Russian surgeons who flew in from Moscow to join us at this session. I found them to be an interesting group. One of them, fortunately, spoke English, so we were able to converse quite satisfactorily. They demonstrated with a motion picture that they brought with them the transplantation of one dog's heart into another dog's circulation, and said it had functioned for approximately 30 days. This procedure, in part, was made possible by utilizing the stapling device which one of the surgeons has devised for making rapid blood vessel anastomoses. Unfortunately, despite my most avid attempts to get them to visit us in Boston, this was not permitted by the State Department, since at that time Boston was not on the list of American cities Russian citizens were permitted to visit. (It has been added since.) Following this meeting, I joined others of the MGH Staff in Honolulu, at the meeting of the Pan-Pacific Surgical Association, where we missed our President, Dr. Arthur W. Allen, but were glad to hear while we were out there that he had left the hospital and was on the road to recovery."

At the International Symposium on Enzyme Chemistry, held in Tokyo and Kyoto, Japan, one thousand enzyme biochemists from all over the world gathered to exchange ideas and discoveries. Dr. Dorothy Villee, Research Fellow in the Children's Medical Service, attended the Symposium, in company with six other Harvard biochemists. It was felt by all who attended that the meeting was highly successful and that it presented a unique opportunity for Western scientists to meet and talk with their Eastern colleagues.

* * *

A short note has arrived from Brigadier General Richard Collins, USA (*E.S.* 1933). He gives as his address: The Joint Staff, Room 2E 966, The Pentagon, Washington 25, D.C., where he serves as Deputy Director for Intelligence. Having received an Alexandria, Virginia, address for General Collins, we automatically classified him as our Alexandria "singleton", wrote him to that effect, and received the following reply from him:

> I have your note about "singletons" and hasten to reply. Unfortunately, Alexandria is not as "single" on the ground as it might look in a directory. It is, in fact, part of Washington's bedroom. As a result, even if I were still practising medicine, I could probably contribute nothing distinctly Alexandrian.
>
> I am still doing business in the same stand, as you can see.
>
> Please convey my best wishes to my many friends who are still connected with the Hospital.

EPIDEMIOLOGICAL STUDIES OF NUTRITION IN PREGNANCY*

The need for epidemiological studies of nutrition in pregnancy was indicated clearly by the speakers this morning. Many, in reporting laboratory experiments with animals, stated their reservations in applying that work to the human. It is not possible for nutritionists and physicians to stop at this point. In fact, the experimenters themselves would not want this. The epidemiological study, therefore, offers the only opportunity for the study of the problem of nutrition in pregnancy in the human.

The epidemiological study, as you know, is based on the interrelationships among host, agent, and environment. Though it is often difficult, they must be defined clearly if various studies are to be valid within themselves and are to be compared with each other. This is true of studies within the broad confines of our own country — to say nothing of attempting, otherwise, to compare studies in foreign lands with those done in the United States.

The host in this case is obviously the mother and her fetus. Yet many would quarrel immediately with this possibly rather narrow definition. Certainly the baby after birth is properly one of the hosts and a definite question may be raised as to including the father and the entire family in this category. Furthermore, whichever individuals are considered in this grouping, great care must be taken to be sure that the host is so clearly defined in respect to all of his attributes that it will be possible to evaluate and compare studies critically at a later date. This is no easy task.

The agent in these studies, certainly, is nutrition. Yet this in itself, as you have seen here today, has many aspects. We must consider as part of the agent the individual nutrient, the total diet, the nutritional status of the mother, and the means of obtaining information about these — whether by biochemical analyses, by studying the aliquot amounts of the diet, by simple dietary histories, by full diet research dietary histories, by sample meals, or by other mechanisms. The type of personnel involved in the determination of these factors must come in for examination as well. All these variables, of course, complicate the problem.

The environment in these studies is inconceivably broad. Nutrition never operates in a narrow field. You have seen demonstrated this morning the physical, social, and emotional influences which help shape the ultimate nutritional state. Possibly in epidemiological studies this is the most difficult area in which to achieve comparable constants. Great care must be taken in describing the actual "total climate" in which subjects as well as workers move.

It is clear that many problems beset the investigator who would rely upon an epidemiological study in searching for knowledge in this field. The gremlins of multiple variables beset him at every turn. Yet variability is such a fundamental human characteristic that it would be useless to try to avoid it. The manner in which these variables are handled marks the significance of the individual studies and the degree to which they can be compared with each other. In spite of all these inherent difficulties, the epidemiological study remains the only method at the present time for evaluating nutritional influences in human pregnancy on a large scale.

In the past thirty years or more there have been many studies of this type.

Perhaps the oldest and best known — one to be termed the classic study — is that of Ebbs, Tisdall, and Scott in Toronto (1). Three groups of women were studied during the latter half of pregnancy. The diets of the women in one group were supplemented to an excellent nutritional level, another group was taught an excellent diet for pregnancy, while the third group remained on poor diets and therefore served as control. The incidence of abortions, premature births, stillbirths, and neonatal deaths was significantly higher in the group on a poor diet. Not only did the women in the groups with supplemented and good diets have healthier babies, but they themselves proved to be better obstetric risks. They suffered fewer complications, including less toxemia, and had fewer difficulties during labor, delivery, and the post-partum period. The ability of the mother to nurse her infant also appeared to be influenced by the quality of the diet during pregnancy.

Tompkins and Wiehl (2) in their studies showed that an approximately normal gain in weight during the first two trimesters is necessary to reduce the hazard of toxemia, and that an excessive restriction in the rate of gain during this period seriously increases the probability of premature labor. The importance of the rate of weight gain in the three trimesters of pregnancy was stressed.

Woodhill (3) has recently reported the results of her studies of 186 pregnancies among Australian women. She, also, found a relationship between the maternal diet and the incidence of toxemia — patients having a "very poor" dietary rating showing 35% incidence as opposed to 4% only for those in a "good or excellent" class. The incidence of prematurity ranged similarly between 19% and 0%, and the duration of lactation was related to the level of the maternal diet. Her study is noteworthy for a thorough examination of the many variables which enter into such a method.

Other noteworthy studies are those of Scrimshaw in Guatemala (4), and Woodruff in Africa (5).

It is only fair to say also that other workers have been unable to make similar correlations.

Williams and Fralen (6), in an extensive study of 514 women in Philadelphia, could not show any positive relationship between dietary adequacy and the occurrence of certain complications of pregnancy and childbirth.

Smith (7) reported in 1947 the results of his study of pregnant women in northwestern Holland during the severe undernutrition of the winter of 1944-45. Although infertility was common, and infants conceived before the hunger months but born during that period were significantly below the expected birth weight and length, toxemia, fetal loss through stillbirth, and neonatal death were not increased. In interpreting these results against certain American and Canadian studies, Smith indicates the need for careful analysis of the samples for comparability. It is possible, he suggests, that a chronic malnutrition may act in a manner quite different from an acute undernutrition in women previously well nourished.

Darby and his associates (8), beginning in 1945 at Vanderbilt University School of Medicine, have conducted a cooperative study of maternal and infant nutrition designed, among other purposes, to ascertain whether there existed for patients presenting themselves for care at their hospital clinic "any significant relationship between nutriture and the development of maternal and fetal complications." By December of 1950, 2,046 white women were included in the study. The workers were unable to identify nutrition as a major causative factor in the development of any of the ordinary obstetric and fetal abnormalities. They recognized that pregnancy and the health of the offspring can be adversely influenced by nutritional deficiencies of sufficiently severe degree and demonstrable etiology. However, these were not the conditions found in the women of their study. They conclude finally "either that there does not exist a direct causative relationship between malnutrition and these abnormalities, or that our patients were above any such level of nutrition required to precipitate the disease."

---

*Introductory talk to panel discussion to review epidemiological studies at a Symposium on Nutrition in Pregnancy, sponsored by the Council on Foods and Nutrition, American Medical Association, University of Missouri Medical Center, Columbia, Missouri, October 11, 1957.

In our own studies at the Harvard School of Public Health, the Boston Lying-in Hospital, and the Children's Medical Center, we have found certain statistically significant correlations between maternal nutrition and the mother's pregnancy and her baby.

Two hundred sixteen infants and their mothers were studied carefully from the nutritional, obstetrical, and pediatric viewpoints. Data were collected by the workers in each of these fields independently, with no knowledge of others' findings until the final assembling of the material. The details of methods of examination and evaluation used are given in the initial papers (9). Particularly important is the method of taking the dietary history (10), which involves a careful cross check to validate the mothers' statements.

If the 216 infants were divided into three groups according to their mothers' diets and they themselves were rated from "excellent" to "poorest", 94% of the babies whose mothers had been on a "good or excellent" diet were rated "excellent" or "good". On the other hand, if the mothers' diets were "poor to very poor", only 8% of the babies fell into the "excellent" and "good" classes, while 92% were classified as "fair" or "poorest". If the same figures are analyzed further by arranging the maternal diet into four groups, the following figures result (11):

	Condition of infant			
Maternal diet	Excellent	Good	Fair	Poorest
Excellent/Good	42%	52%	3%	3%
Fair	8	50	35	7
Poor	2	28	68	2
Poorest	3	5	25	67

The shift in physical conditions of the infant with each change in either direction in the mean general prenatal dietary rating is clearly indicated. Particular note should be made of the category of the infant marked "poorest". It is only when the maternal diet reaches very low levels against normal standards that the marked change in the condition of the infant occurs. It is equally true that the most favorable results of pregnancy are most likely to be associated with the most favorable maternal diets. All of the stillborn infants, all of the early neonatal deaths with the exception of one, the majority of infants with marked congenital defects, all prematures, and all so-called "functionally immature" infants were born to mothers with inadequate diets during pregnancy.

In our study group a clearly positive correlation existed between the quality of the maternal diet and the weight and length of infants, regardless of sex (12). Osseous development followed a similar pattern.

While a poor to very poor maternal diet appeared to enhance the occurrence of toxemia, no statistically significant association was found between prenatal nutrition and the duration and character of labor or delivery (11). There was a tendency, however, for the mothers with the poorer diets to have more difficult types of labor and more major complications at delivery. Again no statistically significant relation was found between prenatal nutrition and the post-partum course, but major complications tended to appear more frequently in the poorer diet groups.

A later study (13) of 68 siblings born to 57 of the women studied previously in the original group produced interesting results. Whether added to the original 216 or viewed separately as a new group, the distributions of the original 216 were repeated. It was further possible to compare the first against the second sibling of 53 of these mothers. The numbers are not sufficient for statistical significance, but improvement of the infants' conditions followed improvement in the maternal diet, while the opposite effect also was true. Unfortunately, however, only 11 mothers improved their diets during their second pregnancies, and 12 of the mothers ate poorer diets than in their first gestations. The remainder made no essential gain or loss. It would seem, therefore, that strong effort is necessary to produce a change in fundamental eating habits.

In an effort to secure direct biochemical evidence of a maternal and fetal nutritional relationship, a study of the effect of maternal diet on size and content of the fetal liver was made (14). The liver material was obtained from autopsies of all non-macerated fetuses and newborn infants dying in less than forty-eight hours at the Boston Lying-in Hospital, during a five-year period. The livers were analyzed by size and, in varying numbers, for the concentration of riboflavin, ascorbic acid, vitamin A, protein, iron, and thiamine. The authors concluded "that even though fetal growth in the human species is relatively slow compared with that in many other mammals, the weight and composition of at least one important fetal tissue reflects maternal intake during pregnancy and presumably can be altered by improvement of the mother."

On the basis of this work we believe these statements can be made. First, that when dietary deficiency reaches a certain inadequacy, the fetus appears to suffer more than the mother. Probably for the same physiological reason, unless the maternal diet is "very poor" the high percentage of the "poorest" infants does not appear. Second, it follows from this that there is a great safety factor built into human pregnancy. The corollary of this statement, however, is equally true — that the best chance of having an infant in "excellent" condition comes only with the "good to excellent" prenatal diet. Finally, nutrition is a controllable factor, although to make a change for the better requires great effort. The fact that emotional, social, and economic influences bear heavily on eating habits only complicates the problem.

In a somewhat more philosophical vein, there are three significant generalities that can be drawn from the evidence I have presented.

In the human, conditions are never as simple as in the controlled laboratory experiment. It is impossible, therefore, to define nutrition as the only factor in producing the results that have been reported. I believe that the evidence indicates the fundamental importance of good nutrition in normal pregnancy. Though in some individuals and in certain situations it may be of critical significance, nutrition is by no means the only factor affecting the pregnant woman. But it is one of the controllable factors. Therefore, it comes within our power always to provide the optimum in nutrition to every mother.

If this is true, then, we have at least one element in the solution of the major obstetrical problem of the day. That is the right of every mother to be delivered without injury and the right of every baby to be born not only alive but well, with its total potential unimpaired. It is no longer sufficient for the mother to escape death in delivery or for the baby to be born without gross birth injury. The mother must be able to resume fully her role in the family, undamaged physically and emotionally, and the baby must be brought into this life without jeopardy to his future development. If some subtle deficiency in pregnancy care has reduced a baby with the organic cerebral equipment of a possible genius to the capabilities of only an average man, the delivery is a failure. Worse still is the reduction of a baby destined to grow into a solid average citizen to the level of the deficient who is a constant community problem.

Just as it is true that nutrition is only one factor, it follows that there are many other elements of total pregnancy care. Such care, then, is compounded not only of physical but of emotional, social, and economic factors as well. It is only through this broad-view approach that the ideal goal of total pregnancy care can be reached.

It is the epidemiological method which has in no small way pointed to this broad approach which sees not merely the pregnant woman, but the pregnant mother, in the pregnant family, in the pregnant community.

Samuel B. Kirkwood, M.D.,
Associate Obstetrician, M.G.H.
and *Commissioner of the Department of Public Health, Commonwealth of Massachusetts*

* * *

Dr. Anne Parsons, Assistant Sociologist at McLean Hospital, has been awarded a National Institute of Mental Health, Public Health Research Grant, to continue her studies on cultural aspects of schizophrenia. In May Dr. Parsons will go to Naples, Italy, for 18 months, where she will be associated with the Institute of Psychology at the University of Naples.

The Board of Trustees, at their meetings on November 29 and December 13, voted:

To accept the resignation of Dr. William J. Brown, Jr. from the position of Assistant Radiologist;

To accept with regret the resignation of Dr. Joseph Hanelin from the position of Radiologist, effective November 30, 1957, and to appoint him as Clinical Associate in Radiology, effective December 1, 1957.

To reappoint:

Dr. John A. Malcolm as First Assistant Resident in Surgery, beginning January 1.

To appoint:

Dr. Robert E. Ball as Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Oliver Cope as Acting Chief of the Surgical Services during the absence of Dr. Churchill;

Dr. Barbara C. Gurd as Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Ken Hashimoto as Assistant Resident in Dermatology, beginning July 1;

Dr. Herbert R. Lazarus as Resident in Psychiatry at McLean Hospital, beginning July 1;

Dr. Richard A. Mayo as Assistant in Orthopedic Surgery, beginning January 1;

Dr. Henning Pontoppidan as Assistant in Anesthesia if and when he obtains his permanent Massachusetts license;

Dr. Stuart E. Price, Jr. as Assistant Resident in Urology, beginning September 1;

Dr. Dwight R. Robinson as Third Assistant Resident in Surgery, beginning July 1;

Dr. Alfred D. Surtees as Chief Resident in Anesthesia, for the period January 1 through July 24;

Dr. Sanford D. Weinert as Assistant Resident in Urology, for the period December 1, 1957 through May 31, 1958.

To change the appointment of:

Dr. Victor J. Rosen, Jr. from Intern in Surgery to that of Intern in Pathology, for the period November 16, 1957 through June 30, 1958.

To change the titles of:

Mr. William H. Ellett from Assistant Biologist to Assistant Physicist (Medicine);

Mr. Emery Nyilas from Assistant Biologist to Assistant Physicist (Medicine).

At their meetings on November 13, and December 4 and 11, the General Executive Committee voted:

To grant Dr. Robert E. Key leave of absence from the position of Assistant Resident on the Orthopedic Service for the month of December 1957, and to appoint him as Clinical Assistant in Orthopedic Surgery during that month, with the privilege of assisting Dr. Otto E. Aufranc in the Baker Memorial, Phillips House, and Fracture Office. It is understood that he will return to the position of Assistant Resident on January 1, 1958 and will affiliate at the Lemuel Shattuck Hospital for six months, after which he will be promoted to Senior Resident in Orthopedic Surgery, beginning July 1.

To promote:

Dr. Robert W. Chamberlin, Jr. from the position of Second Assistant Resident to that of Assistant Resident on the Children's Medical Service, beginning July 1;

Dr. Stanford B. Friedman to the position of Assistant Resident on the Children's Medical Service, beginning July 1;

Dr. Alfred J. Luessenhop to the position of Clinical Assistant in ~~Neurology~~, beginning January 1, with the privilege of assisting Dr. Jost J. Michelsen with his private practice;

Dr. Gerhard Nellhaus from the position of Assistant Resident to that of Chief Resident on the Children's Medical Service for one year, beginning July 1;

Dr. Patrick F. Rose from the position of Second Assistant Resident to that of Assistant Resident on the Children's Medical Service, beginning July 1;

Dr. Margaret A. Single to the position of Assistant Resident on the Children's Medical Service for one year, beginning January 1.

To reappoint:

Dr. Josip Matovinovic as Clinical and Research Fellow in Medicine for one year, beginning December 12, 1957;

Dr. Claus W. Reichle as Clinical and Research Fellow in Anesthesia for one year, beginning January 1;

Dr. Marie Sadka for one year, beginning January 1, with a change in title from Clinical and Research Fellow in Neurology to that of Research Fellow in Neuropathology;

Dr. John T. Sharp as Clinical and Research Fellow in Medicine for one year, beginning December 1, 1957.

To appoint:

Dr. David C. Blair as Clinical Fellow in Physical Medicine for one year, beginning July 1;

Dr. Alison K. Scott as Clinical and Research Fellow on the Children's Medical Service, beginning January 2;

Dr. Beatrice E. Sleigh as Clinical Fellow in Anesthesia, beginning June 1;

Dr. Yasuzo Tsukada as Research Fellow in Neurosurgery, beginning December 23, 1957.

ADOLESCENT ENDOCRINE CLINIC

The Adolescent Endocrine Clinic was established in 1942 by Drs. Butler and Talbot at the time of Dr. Butler's appointment here as Chief of the Children's Medical Service. A small group of patients in whom Dr. Butler and Dr. Talbot had already become interested formed its nucleus. New patients were added to the original group by referral from the Children's Medical and other out-patient clinics and, as this new Clinic began to become known, its material was enriched by referrals from physicians outside the Hospital. "Adolescent Endocrine" soon became a misnomer both because children of all ages were seen and because, as will later be evident, interests developed in areas beyond endocrinology as strictly defined. Then, as now, the Clinic met weekly on Friday afternoons and had as its purposes: first, service to the patients; second, teaching of house officers, interested staff members, and postgraduate students; and third, research into the problems of pediatric patients of the types seen in such a specialty clinic.

Early, the Clinic population was composed of patients with the classic primary endocrinopathies. Those with diabetes mellitus and thyroid disorders, especially hypothyroidism, comprised the two largest groups. Next in order of frequency came patients with dwarfism due to causes other than thyroid deficiency and patients with sexual precocity. Smaller numbers of patients with diabetes insipidus, resistant rickets, ovarian agenesis and the like were seen for diagnosis, and these patients returned at intervals for treatment. With the passage of time, the frequency with which these various categories of patients with primary endocrinopathy has changed is but little. There has been, however, an ever-increasing amount of attention given in the Clinic to the patient who formerly was seen but once, and then discharged. This was the patient who, by the best available criteria, was endocrinologically normal but had some functional complaint like obesity or was suffering a metabolic disturbance such as that which may result, for instance, from chronic renal insufficiency. Most recently, as longer and longer follow-ups have impressed their lesson, an increasing focus of attention has been turned toward a problem common to both this group and a group of patients with primary endocrine disease. That is the problem posed by the patient for whom there is highly effective therapy but who nevertheless fails to do well because he lacks sufficient motivation to avail himself of help offered. Of particular concern in this respect have been the juvenile diabetics. Our attempt to cope with this problem will be touched on later.

Interestingly, in attempting to fulfill its teaching function the Adolescent Endocrine Clinic at one point was confronted with a rapidly declining patient attendance. Initially, teaching was carried out informally by Dr. Butler and Dr. Talbot in the examining rooms as they saw the patients. The increasingly large group of house officers, staff members, and visitors who crowded in eventually interfered to a major degree with the patients' sense of privacy. In addition, the larger the number of observers the slower the progress from patient to patient, with the result that distressingly long periods in the waiting room were frequent. Recognizing the responsibility of these factors to the falling patient census, a change of procedure was adopted in 1949 which has had many advantages, in addition to bolstering Clinic attendance.

Each week one of the research fellows in the Department reviews the records of the 15 to 20 patients scheduled for the coming Friday and amasses from various sources as much pertinent information as possible on newly referred cases. For an hour and a half immediately prior to the time of the first scheduled appointment on Friday, a Clinic "preview" is held. This preview session is attended not only by the group who will actually see the patients but also by the visitors and other interested physicians who had formerly crowded the examining rooms. The pertinent features of the current problems of each patient are briefly presented and discussed. Suggestions are frequently forthcoming as to new diagnostic procedures to be tried. Responses to therapy are critically evaluated with the aid of charts, and experience with groups is brought to bear on the problem of the individual. At the end of the discussion the patient is assigned to one physician for interview and examination. This physician, who may not have seen the patient previously, is then equipped to initiate or carry on therapy or to pursue diagnosis with a sense of reassurance that would not otherwise have been possible. Appointments are made on a time schedule to prevent the simultaneous arrival of three or four patients all expecting to see the same physician. It has been apparent that the patients not only appreciate the return of prompt attention and privacy thus made possible but also the benefits that accrue from the group consideration of each patient. Dr. Talbot and the writer attend the Clinic to serve the function of introducing old patients to new physicians as well as to evaluate, on the spot, changes in physical findings, unexpected developments, or to expedite administrative problems.

At the conclusion of each Clinic session the records are returned to the physician who prepared the preview session. At this time he has an opportunity to review the developments at this visit. It is also his responsibility to see that letters are sent to the referring physicians and to follow up on laboratory data which may not be at hand for some days.

The Adolescent Endocrine Clinic has been a productive research laboratory. The book, *Functional endocrinology from birth to adolescence* by Drs. Talbot, Sobel, McArthur, and Crawford is largely based on experiences in the Clinic. Dr. Gertrud Reyersbach and Dr. Butler have contributed papers on the management of the juvenile diabetic. A series of papers by Dr. Edna Sobel and Dr. Talbot describes their observations on the effect of methyltestosterone in problems of growth. The entity of hypocaloric dwarfism has been defined with respect to its clinical attributes as well as its high frequency and causation. In one of the papers resulting from this study Dr. Erich Lindemann joined us in pointing up the psychiatric aspects. Drs. Frederic Blodgett and Leo Burgin collaborated in a study of the effects of cortisone on linear growth of patients drawn from this and the Allergy Clinic. Dr. Janet McArthur has published on her experiences in treating adolescent girls with menstrual disorders. Dr. Mary Arnold's interest in patients with thyroid disease led to reports on optimal dosage for patients with hypothyroidism as well as a review with Drs. Talbot and Cope of the experiences with surgical therapy of juvenile thyrotoxicosis. Lack of space precludes a complete listing of the contributions which have been accumulating at an increasing pace as the active participation of the Department's research fellows has grown.

In conclusion one more word is in order regarding the increased interest of the Clinic group in the patient who fails to take advantage of therapy of proved benefit. Dr. John Lamont of the Children's Psychiatry Service, Miss Patricia Clark of the Social Service Department, and Dr. Stuart Flerlage, our newest member, in whom are combined medical and divinity school backgrounds, have joined us in an attempt to fathom the ingredients of patient motivation. In this effort we are also calling upon educators, theologians, social scientists, and others in the community who may have special knowledge or techniques of value. While our focus is on the therapeutic failures, emphasis is also being given to study of the personality make-up and social ecology of the patients who have been eminently successful in coping with their disabilities. Our aim is to define methods for dealing more effectively with a large group of patients, representative of a wide spectrum of disease including juvenile diabetes, obesity, hypocaloric dwarfism, advanced renal disease, and gonadal disgenesis, to mention only some of the areas where the challenge is met.

John D. Crawford, M.D.,
Physician to Children's Medical Service

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

General Medicine

Irwin, J. W., Itkin, I. H., Weille, S., and Little, N.
Diseases of the chest: Bronchial asthma.
In A.M.A. Scientific Exhibits, 1957, New York, Grune & Stratton, Inc., 1957, pp. 49-55.

Gynecology

Simmons, F. A.
Role of the husband in therapeutic donor insemination.
Fertil. & Steril. 8:547-550, 1957.

Laboratory Science

Waddell, W. R., Geyer, R. P., Olsen, F. R., and Stare, F. J.
Clinical observations on the use of nonphosphatide (Pluronic) fat emulsions.
Metabolism 6: 815-821, 1957.

Neurosurgery

White, J. C.
Care of the severely injured patient — neurosurgical injuries.
J.A.M.A. 165:1924-1930, 1957.

Ophthalmology

Dunphy, E. B.
Management of intraocular malignancy.
Am. J. Ophth. 44:313-322, 1957.

Orthopedic Surgery

Aufranc, O. E., Barr, J. S., and Rowe, C. R.
The upper extremity: The shoulder.
In The American Academy of Orthopaedic Surgeons instructional course lectures, R. Beverly Raney, M.D., Editor, Ann Arbor, Michigan, J. W. Edwards, vol. 14, chap. 2, pp. 107-122, 1957.

Psychiatry

Lindemann, E.
Problems related to grandparents.
In Understanding your patient, Samuel Liebman, M.D., Editor, Philadelphia, J. B. Lippincott Company, pp. 147-158, 1957.

The next issue of THE NEWS will be the last one in which 1957 titles will appear.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Abraham, E. P.
Biochemistry of some peptide and steroid antibiotics. (Ciba Lectures in Microbial Biochemistry, No. 2)
New York, John Wiley & Sons, Inc., 1957.
(5B)

Annual review of biochemistry, vol. 26.
Palo Alto, Calif., Annual Reviews, Inc., 1957.
(5A)

Ball, T. L.
Gynecologic surgery and urology.
St. Louis, The C. V. Mosby Company, 1957.
(24A)

Brown, J. B., and McDowell, F.
Neck dissections.
Springfield, Ill., Charles C. Thomas, 1954.
(23P)

Bychowski, G., and Despert, J. L.
Specialized techniques in psychotherapy.
New York, Basic Books, Inc., 1952.
(22V)

National Health Council
Ten million and one.
New York, Paul B. Hoeber, Inc., 1957.
(19O)

New York Academy of Sciences. Special Publications, vol. 5.
Cellular biology, nucleic acids and viruses.
New York, New York Academy of Sciences, 1957.
(12A)

United States Congress. Joint Committee on Atomic Energy. Special subcommittee on radiation.
The nature of radioactive fall-out and its effects on man. 2 pts.
Washington, D. C., United States Government Printing Office, 1957.

VOLUNTEER GROUPS

MGH STAFF WIVES ASSOCIATION

Through the generosity of an anonymous donor, it has been possible for the Staff Wives to purchase a baby grand piano, in excellent condition, for our Chapel. The piano was "christened" on January 8, when Staff Wife-er Anne Talbot (whose husband is Dr. Nathan B. Talbot of the Children's Medical Service) presented a program of songs, with Mr. John Woodworth as accompanist.

On January 24, Mr. Rowland Sturges of Cambridge gave a piano recital in response to the many requests that he reappear in our Chapel concerts.

Another of the Staff Wives Association social hours, which always afford opportunities for our professional visitors from other lands and from elsewhere in this country, and members of the Hospital staff and their wives to meet, was held on January 21 in Bartlett Hall. It was a morning coffee party, to which Distaff Club members were also invited. Many of the acquaintances first made at the Hospital parties during the Christmas season and at festivities in staff members' homes were happily renewed on this occasion.

DISTAFF CLUB

One of the highlights of our present year's activities was our January 16 meeting. We were very fortunate to have as our speaker Mr. W. G. Constable, recently retired Curator of Painting at the Boston Museum of Fine Arts. His subject was "Collectors and collecting". In his stimulating talk he discussed how the collector works, and explained the potential triumphs and pitfalls in collecting and how certain great collections have been assembled.

On January 21, Distaff-ers were invited to a morning coffee given by the Staff Wives Association. This was a very pleasant occasion and provided an excellent opportunity for us to become better acquainted with the Staff Wives.

Area meetings will be held in various homes throughout February. This is a good way for newcomers to meet people first in small groups. It is also a more convenient way to get together in stormy weather.

The Distaff Club is most appreciative of the hospitality extended to us by Mrs. Soma Weiss. Our members have been invited to her home for an evening of music on February 9.

Our group looks forward to our March agendum, which includes a game night — always one of the most popular evenings of the year. Cards, scrabble, etc. will be available, and, of course, a chance to talk.

MASSACHUSETTS EYE & EAR INFIRMARY

Fellowships in the New York Academy of Sciences were conferred upon Endre A. Balazs, M.D. and Laszlo Varga, Ph.D. of the research staff of the Retina Foundation, 30 Chambers Street, Boston, "for outstanding work toward the advancement of science". The Retina Foundation was established about six years ago, to do basic eye research in affiliation with the Massachusetts Eye and Ear Infirmary and the Harvard Medical School.

Dr. Balazs and Dr. Varga were among the limited number of scientists from all over the world elected this past year to Fellowships by the New York Academy. Dr. Balazs, who was born in Budapest, Hungary, did extensive research both in Budapest and in Stockholm, Sweden, before coming to the Retina Foundation in 1951 as Associate Director in charge of the biochemistry and biology units. Dr. Varga, also born in Hungary, was associated with the Department of Biology at the Massachusetts Institute of Technology before joining the Foundation research team which is studying connective tissue — especially certain connective tissues of the eye, such as the vitreous body, the cornea, and the uvea.

At a meeting of the Executive Committee of the Massachusetts Eye and Ear Infirmary, held on December 16, 1957, the following votes were passed:

Dr. Maurice B. Rappaport was appointed Research Associate in Otology;
Dr. Mendell Robinson was appointed Assistant in Otolaryngology;
Dr. Albert Weiser was appointed Assistant in Otolaryngology.

The following resignations were accepted:

Dr. Richard Coffey from the position of Graduate Assistant in Otolaryngology;
Dr. Daniel F. Milam from the position of Assistant in Ophthalmology;
Dr. Bernard H. Zeavin from the position of Assistant in Ophthalmology.

BIOGLETS

Dr. Richard H. Aster, Intern in Medicine—born in Grand Rapids, Michigan, July 30, 1930; B.S., University of Michigan, 1952; M.D., University of Michigan, 1957; married; one child; home: Grand Rapids.

Dr. James H. Duxbury, Assistant Resident in Urology—born in Ladysmith, British Columbia, Canada, 1927; B.A., University of British Columbia, 1949; M.D.C.M., Mc Gill University, 1953; Intern, rotating, Montreal General Hospital, 1953-54; Intern in Surgery, Queen Mary Veterans Hospital, Montreal, 1954-55; Resident in Surgery, Reddy Memorial Hospital, Montreal, 1955-56; Resident in Pathology, Royal Jubilee Hospital, Victoria, British Columbia, 1956-57; married; one daughter; home: Victoria, British Columbia.

Dr. John R. Huckell, Assistant Resident in Orthopedics—born in Edmonton, Alberta, Canada, February 6, 1928; B.Sc., University of Alberta, 1948; M.D.C.M., McGill University, 1952; Intern, Montreal General Hospital, 1952-53; Resident in Pathology, University of Alberta Provincial Laboratory, 1953-54; Assistant Resident in General Surgery, University of Alberta Hospital, 1954-55; Assistant Resident in Orthopedic Surgery, University of Alberta Hospital, 1955-56; Assistant Resident in Orthopedic Surgery, Children's Medical Center, Boston, Massachusetts, 1956-57; married; three children; home: Edmonton, Alberta, Canada.

Dr. William E. Karnes, Resident in Neurology (Captain, MC, USAF, on active duty with duty station at the Massachusetts General Hospital)—born at Fort Sam Houston, San Antonio, Texas, September 5, 1930; B.S., University of Oklahoma, 1952; M.D., University of Oklahoma, 1955; Intern (Air Force), Tripler Army Hospital, Honolulu, T.H., 1956; Fellow in Neurology, acting as Assistant Resident, Massachusetts General Hospital, 1957; married; two sons; home: Oklahoma City, Oklahoma.

Dr. Betty J. McClellan, Intern in Pathology—born in Little Rock, Arkansas, October 26, 1932; B.S., Southern Methodist University, Dallas, Texas, 1955; B.M. and M.D., University of Arkansas School of Medicine, Fayetteville, 1957; home: North Little Rock, Arkansas.

Dr. D. Glyndwr Millard, Assistant Resident in Radiology—born in Featherstone, Yorkshire, England, October 14, 1922; attended St. Michael's School, Bryn-Llanelly, South Wales; military service: Pilot, Royal Air Force, Flight Lieutenant, serving in Rhodesia, South Africa, North Africa, Malta, Italy, Egypt, Palestine, Cyprus, Greece, Lebanon, Syria, France, and England, 1940-46; M.B., B.S., St. Thomas's Hospital Medical School, University of London, England, 1953; Intern, Newton-Wellesley Hospital, Newton Lower Falls, Massachusetts, 1953-54; general practice, Jaffrey, New Hampshire, 1954-57; married; one daughter.

Dr. Robert G. Ojemann, Assistant Resident in Neurosurgery—born in Iowa City, Iowa, May 5, 1931; B.A., State University of Iowa, Iowa City, 1952; M.D., State University of Iowa School of Medicine, 1955; Intern, Cincinnati General Hospital, Cincinnati, Ohio, 1955-56; Assistant Resident in General Surgery, Baylor University College of Medicine, Houston, Texas, 1956-57; married; one son.

Dr. John T. Potts, Jr., Intern in Medicine—born in Philadelphia, Pennsylvania, January 19, 1932; B.A., La Salle College, Philadelphia, 1953; M.D., University of Pennsylvania, 1957; home: Moorestown, New Jersey.

Dr. Dwight R. Robinson, Intern in Medi-

Dr. Samuel B. Kirkwood, Associate Obstetrician — Commissioner of the Department of Public Health, Commonwealth of Massachusetts

cine—born in Morristown, New Jersey, September 7, 1931; B.A., Cornell University, 1953; M.D., Columbia University, 1957; home: Mendham, New Jersey.

Dr. Earle H. Rosenberg, Intern on the Dental Service—born in Cambridge, Massachusetts, April 24, 1929; A.B., Harvard College, 1951; M.A., Boston University, 1953; D.M.D., Harvard School of Dental Medicine, 1957; married; one daughter; home: Brookline, Massachusetts.

Dr. Stefan C. Schatzki, Acting Resident in Radiology—born in Leipzig, Germany, July 16, 1931; B.A., Harvard College, 1952; M.D., Harvard Medical School, 1956; Intern, Harvard (II & IV) Medical Service, Boston City Hospital, Boston, Massachusetts; married; one son.

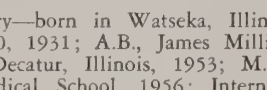
Dr. R. Neal Schneiderman, Resident in Dermatology—born in Omaha, Nebraska, November 15, 1930; B.S., Northwestern University, Evanston, Illinois, 1952; M.D., Northwestern University, 1955; Intern, Mount Zion Hospital, San Francisco, California, 1955-56; Resident, University of California Hospital, San Francisco, 1956-57.

Dr. Richard H. Smith, Assistant Resident in Psychiatry—born in Woodsfield, Ohio, December 4, 1928; A.B., Ohio State University, 1949; M.D., Ohio State University Medical School, 1953; Intern, rotating, Ohio State University Medical Center, 1954; military service: Private, U.S. Army, Fort Knox, Kentucky, 1954-56; Resident in Psychiatry, Harding Sanitarium, Worthington, Ohio, 1956-57; married; now living in Boston.

Dr. William L. Strickler. Assistant Resident in Surgery—born in Watseka, Illinois, September 20, 1931; A.B., James Millikin University, Decatur, Illinois, 1953; M.D., Harvard Medical School, 1956; Intern in Surgery, Barnes Hospital, St. Louis, Missouri, 1956-57.

Dr. David Van Buskirk, Intern in Medicine—born in Pittsburgh, Pennsylvania, February 10, 1932; B.A., Yale University, 1953; M.D., Harvard Medical School, 1957; married; one child.

Dr. Arnold N. Weinberg, Assistant Resident in Medicine — born in Brooklyn, N. Y., September 30, 1929; B.S., Cornell University, Ithaca, N. Y., 1952; M.D., Harvard Medical School, 1956; married; three children.



New addresses:—

Dr. Haroutioun A. Aprahamian (a.r.p. *An.* 1956), Dept. of Surgery, Section of Anesthesiology, Yale University School of Medicine, New Haven, Conn.
Dr. Bradford Cannon (assoc. v.s.) Suite 808, Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. Miriam W. Carmichael (a.r.p. *N.* 1956), Medical College of Virginia, Richmond, Va.
Dr. Lincoln D. Clark (*M.* 1948), Dept. of Psychiatry, Salt Lake County General Hospital, 156 Westminster Ave., Salt Lake City, Utah - *a temporary address*
Dr. Edwin M. Cole (r.p. *N.* 1932 & r.p. *Psychiat.* (*McL.*) 1934), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. John R. David (*M.* 1956), National Institutes of Health, Bethesda 14, Md.
Dr. Francis L. A. de Marneffe (a.r.p. *Psychiat.* 1952), 84 Garden St., Cambridge 38, Mass.
Dr. Robert H. Hansen (a.r.p. *An.* 1957), 286 Marion Drive, Baton Rouge, La.
Dr. Wayne M. Hebertson (r.p. *N.* 1957), National Hospital, Queen Square, London, England
Dr. Justin R. Hüppe (r.p. *R.* 1957), Adelbert Stifter Str. 27, München 27, Germany
Dr. William F. Ketchum (*C.M.* 1948), American Cyanamide Co., Danbury, Conn.
Dr. John D. Leidholt (a.r.s. *Or.* 1952), 830 E. 18th Ave., Denver, Colo.
Dr. Cesare T. Lombroso (a.r.p. N. 1955), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Dr. Allan B. McNie (a.r.p. *Path.* 1957), Dept. of Legal Medicine, Harvard Medical School, Boston, Mass.
Dr. Henry A. Mosher (a.s. *Oph.*), 266 Beacon St., Boston 16, Mass.
Capt. David B. Murray, MC, USAR (a.r.p. *Path.* 1956), 98th General Hospital, Birkenfeld, USAREUR APO 34, c/o Postmaster, New York, N.Y.
Dr. Robert M. O'Brien (*Or.* 1941), 950 Francis Place, St. Louis 5, Mo.
Dr. Frederic H. Packard (supt. emeritus *McL.*), 98 Washington St., Marblehead, Mass.
Dr. Francis M. Rackemann (*E.M.* 1914), 266 Beacon St., Boston 16, Mass.
Dr. Raymond L. Robillard (a.r.p. *N.* 1957), National Hospital, Queen Square, London, England
Dr. John Rock (*W.S.* 1919), 77 Glen Rd., Brookline 46, Mass.
Dr. Fred A. Simmons (*W.S.* 1935), Suite 910, Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. Richard H. Wallace (*W.S.* 1929), 101 River Rd., Weston, Mass.
Dr. Edwin C. Wood (*M.* 1951), Dept. of Psychiatry, Veterans Administration Hospital, West Haven, Conn.
Dr. Donald N. Wysham (*M.* 1954), New York Hospital, New York, N.Y.

Brief bits:—

Dr. Henry K. Beecher lectured recently at the NATO Naval Base at Naples, Italy, on invitation of the Surgeon General, and gave several other lectures in Europe — the final one at the Royal Society of Medicine in London.

Mr. Lloyd D. Brace, a member of our Board of Trustees, has been elected a trustee of the Rockefeller Foundation.

Dr. Benjamin Castleman was guest speaker at the meeting of the California Academy of Medicine on December 7. His subject was "Clinical pathological aspects of hyperparathyroidism". The meeting was held in San Francisco, and many MGH-ers were in the audience — John Sampson, C. A. Noble, Jr., Benson Rowe, Dexter Richards, J. M. Robinson, and John C. Rowe.

Dr. Edwin F. Cave has returned from attending the meeting of the Pan-Pacific Surgical Association, held in Honolulu, where he presented a paper on "Complications of medullary nailing of long bone fractures". This meeting was also attended by Drs. Ulfelder, Welch, and Linton.

A fine tribute to Dr. Charles C. Dennie (*D.* 1914) appears on pages 774-776 of the December 1957 issue of the *A.M.A. Archives of Dermatology.* The piece was written by Dr. Richard L. Sutton, Jr. It carries pictures of Dr. Dennie and of the cup which was presented to him. The article was brought to our attention by a note from Dr. Henry W. N. Bennett (a. *D.* 1928-36) of Manchester, N. H.

Dr. Joseph Hanelin has been appointed Chief of the Department of Radiology at the Newton-Wellesley Hospital. As noted elsewhere in this issue, Dr. Hanelin continues on our staff as Clinical Associate in Radiology.

THE NEWS

No. 175 Boston, Mass. March 1958

THE MIXTER LABORATORIES FOR NEUROPHYSIOLOGY AND BORON CHEMISTRY

The purpose of these laboratories, as with others on this floor, is to obtain a better understanding of nervous tissue in both normal and diseased states. With this in mind, we have sought (1) to diagnose and to grant therapy for disorders of the central nervous system by the utilization of isotopes — both radioactive and non-radioactive, (2) to obtain information leading to a fundamental understanding of the blood-brain barrier under various conditions, and (3) to determine the mechanism of formation and pathways of cerebrospinal fluid.

The various chemical, biological, and physical disciplines are all brought to bear on these problems which involve histology, toxicology, organic and inorganic chemistry, surgical procedures, photomicrography, and radioisotope techniques. This collaboration of people with varied backgrounds allows a more concerted approach for obtaining knowledge of the central nervous system and thus to facilitate therapy for nervous disorders.

The utility of these disciplines can be best illustrated by one of our present efforts directed toward the treatment of glioblastoma multiforme by a neutron capture irradiation therapy — this as an adjunct to surgery. The entire basis for this therapy results from a unique difference between normal and neoplastic tissue in the brain. This is the marked alteration in the blood-brain barrier in the neoplasm, resulting in its increased permeability to many substances which are preferentially excluded to a great extent in normal brain tissue. Thus boric acid, when injected intravenously, achieves a tumor-to-brain boron ratio after thirty minutes of two or three to one. Utilizing the boron^{10} isotope with a high cross section capture for thermal neutrons, obtained from the nuclear reactor, it would seem feasible to be able to destroy tumor tissue selectively. The radioactive process which would occur in tissue is as follows:

$${}_5B^{10} + {}_0n^1 \rightarrow [{}_5B^{11}] \rightarrow {}_3Li^7 + {}_2He^4 \text{ (2.4MEV)}$$

The doubly charged helium, or alpha particle, would dissipate all its energy in about 14 microns of tissue. Thus, the destructive ionizing effect of this particle would be limited to the cell containing B^{10} or to its immediate neighbors. This form of therapy would be used to destroy those cancerous cells behind the tumor face which have escaped surgical removal.

One of the problems has been to obtain compounds which would yield an increased tumor-to-brain boron ratio. This would minimize destruction of brain function and might possibly permit treatment for inoperable tumors. Another part of the problem is to extend the duration of this ratio to allow greater maneuverability in delivering this neutron flux and longer irradiation times.

The first step in this program has been the preparation of boron-containing compounds which fulfill the following requirements:

1) compounds which are relatively non-toxic in large doses
2) water-soluble compounds
3) substances which are stable under the physiological conditions in which they are used

A compound satisfying these conditions is then injected into Swiss albino mice which have intracranial tumors (produced by implantation of methylcholanthrene pellets into the brain) and C 3 H gray mice with subcutaneously transplanted brain tumors. The character of these tumors is ascertained histologically and is determined following successive transplantations to verify the constancy of the tumor. The animals are sacrificed at definite times following the boron injection, and the various tissues are carefully excised and then analyzed by a spectrophotometric procedure for boron content. The method involves digestion of the tissue in concentrated acid, destruction of the organic material, and complex formation of the boron with an organic dyestuff. The spectral change is a function of boron content, and tumor-to-brain boron ratio by this method is then plotted against a time axis.

A compound which gives a consistently high ratio is evaluated by extensive toxicological testing in animals. On this basis it is determined whether a compound could be used in man and what dosage would be well within safe limits. Such substances can then be given to terminal glioma patients to determine their tolerance and to follow their mode of excretion. Satisfactory results with a compound would allow small doses to be given to glioma patients undergoing craniotomy. Boron analysis and histology of the biopsy material would determine the absorption of boron as a function of tumor structure and yield information regarding the dosage required for tumor destruction.

These steps would all be done prior to instituting this procedure as a form of therapy. The nuclear reactor at the Massachusetts Institute of Technology is nearly completed. It is being constructed, in part, with a view to its use in this procedure and other medical research. We will endeavor to utilize the operating facilities there in this proposed neutron capture therapy for brain tumors. Its success will be due completely to the combined efforts of the entire research group.

The complete program is under the direction of Dr. William H. Sweet, Visiting Neurosurgeon at the Massachusetts General Hospital. In addition to Dr. Sweet and to the authors, the various phases of the research are being performed by the following staff: Dr. Derek Gordon, Clinical and Research Fellow — a visiting neurosurgeon from Belfast, Northern Ireland; Dr. Federico Mora, Clinical and Research Fellow, who has completed his neurosurgical residency at this Hospital; Dr. Raymond Kjellberg, Neurosurgical Resident, with several years of research experience in stereotaxic procedures; Miss Beverly Whitman, Senior Technician, who has a Bachelor of Science degree in biology; Miss Winnie Crane, Technician, who has a Bachelor of Arts degree in science; and Mrs. Joan Crowley, Technician, who has had chemical and biological training at Tufts University.

The facilities on Warren 4 are excellent and this, together with a stimulating atmosphere emanating from the other laboratories on the floor, creates an ideal medium for productive research. We are fortunate to be associated with this group.

Albert H. Soloway, Ph.D.,
Assistant Chemist in Neurosurgery
Janette Robinson, A.B.,
Independent Research Worker in Neurosurgery

* * *

WILLIAM FRANKLIN WOOD

His older friends called him Frank, his newer friends addressed him as Bill. Their number was legion. He was respected and loved.

William Franklin Wood was born in New York on November 19, 1890. He was a graduate of the New York Homeopathic Medical College in 1912, and of Tufts College Medical School in 1917. He served in administrative positions in the Massachusetts Homeopathic Hospital from 1917 to 1921; in the Munson State Hospital from 1921 to 1924; as Assistant to the Massachusetts Commissioner of Mental Diseases from 1924 to 1926; and at the Danvers State Hospital from 1926 to 1927.

He was appointed an Assistant Director of the Massachusetts General Hospital in 1928 and was instrumental in promoting the planning, the building, and the opening of the Baker Memorial. In 1932 he became Director of the McLean Hospital, where he served with distinction until his retirement on March 1, 1956. On June 8 of that same year a reception was held in his honor, followed by an informal buffet supper, which was attended by scores of doctors, nurses, and other hospital personnel with whom he had worked for so many years.

During his administration at McLean, many innovations were introduced, including an extensive research program which was housed in a superb new laboratory. His relationship with the patients was kindly and intimate. His friendly personality built up a cordial rapport between the Hospital and the citizens of Belmont — no mean accomplishment. While serving as Director *Emeritus* of McLean Hospital from 1956 to 1958 he continued to be active in outside medical affairs, as Health Officer of the Town of Belmont and as Consultant to the Massachusetts Department of Mental Health.

Dr. Wood lived a full and many-sided life. He was Secretary-Treasurer of the New England Hospital Assembly in 1931, became Vice-President in 1936, and was elevated to the office of President in 1937. He served as Secretary to the Massachusetts Hospital Association from 1941 to 1947, and as President in 1948. He was a corporation member of both the Massachusetts Memorial Hospitals and the Massachusetts General Hospital. Nor were his activities confined merely to medical and hospital affairs, for he was a Past President of the Boston Rotary Club and a member of the Belmont Rotary. He even invaded the financial field as a Director of the Waverley Cooperative Bank and as a Trustee of the Belmont Savings Bank.

In July of 1952 Dr. Wood suffered a severe cardiac infarction, but recovered sufficiently to carry on under restrictions. He died suddenly at his home in Belmont, on January 15, 1958.

The Payson Park Congregational Church in Belmont, where memorial services were held on Sunday, January 19, was filled with his many friends who gathered there to do him honor.

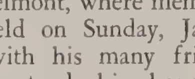
His wife and a daughter, Mrs. Frank H. Gardner of Belmont, survive him.

N. W. F. [axon]

⁂

Mr. Henry R. Shepley, senior partner in the firm of Shepley, Bulfinch, Richardson and Abbott, has been chosen to receive the gold medal award for architecture by the National Institute of Arts and Letters for 1958. He will receive the honor at the joint annual ceremonial of the National Institute and the American Academy of Arts and Letters in May.

Besides many examples of his work in this vicinity and in other parts of the country, Mr. Shepley is responsible for the designs of our new buildings here at the Hospital, including the White Building, the Research Building, and the Warren Building.



The Board of Trustees, at their meetings on December 27, and January 10 and 24, voted:

That Mary A. B. Brazier, Ph.D. be granted leave of absence with pay, for the period January 1 through March 31.

To appoint:

Dr. Donavin A. Baumgartner as Second Assistant Resident in Surgery, beginning July 1;

Dr. John F. Burke as Assistant in Surgery, with the privilege of seeing a limited number of private patients in his office at the Hospital, beginning January 1;

Dr. James J. A. Cavanaugh as an "exchange" Assistant Resident on the Children's Medical Service, for a period of two months, beginning January 2;

Marc A. Fried, Ph.D. as Associate Psychologist for one year, beginning January 15;

Herbert J. Gans, Ph.D. as Assistant Sociologist in the Department of Psychiatry, beginning January 15;

Dr. Stephen M. Krane as Assistant in Medicine, beginning January 1;

Dr. Marvin M. Lipman as Assistant Resident in Medicine, for the period July 1 through December 31;

Dr. Zbigniew J. Lipowski as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Arthur S. Lurie as Assistant Resident in Dermatology, beginning July 1;

Dr. Clyde N. Shealy as Assistant Resident on the Neurosurgical Service, beginning July 1;

Dr. Merrill C. Sosman as Consultant in Radiology, beginning January 1;

Dr. John A. Warden as Assistant in Radiology, beginning July 1;

Dr. Thomas J. Whitfield, III, as Assistant to the Children's Medical Service.

At their meetings on December 24 and during January, the General Executive Committee voted:

That the appointment of Dr. Ronald S. Cowie as Assistant Resident in Orthopedic Surgery be concluded as of January 31, and that he be appointed Clinical Fellow in Orthopedic Surgery, beginning February 1.

To extend the appointment of:

Dr. Lionel O. Garrote as Clinical and Research Fellow in Neurosurgery from March 1 through September 30.

To reappoint:

Dr. Robert L. Bragg as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. John Denovian as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning December 1, 1957;

Dr. Frederick J. Duhl as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Liselotte I. Hecht, Ph.D. as Research Fellow in Medicine for one year, beginning January 1;

Dr. Jack H. Mendelson as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Maurice Thibault as Clinical Fellow in Radiology for one year, beginning July 1.

To appoint:

Dr. Harriet L. Boardman as Clinical Fellow in Psychiatry for one year, beginning January 1;

Dr. Richard J. Brown as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Francis R. Coughlin, Jr. as Clinical and Research Fellow in Surgery, for the period January 1 through June 30;

Dr. Leslie J. DeGroot as Clinical and Research Fellow in Medicine for one year, beginning January 1;

Dr. Judith F. Gould as Clinical Fellow in Anesthesia for one year, beginning September 1;

Dr. William H. Harris as Clinical Fellow in Orthopedic Surgery, for the period February 1 through March 31, and that he be promoted to the position of Senior Resident in Orthopedic Surgery, beginning April 1;

Dr. Jesus S. Manlapaz as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. Alberto Miyara as Clinical Fellow in Medicine, retroactive to October 8, 1957, through June 30, 1958;

Dr. Alex F. Muller as Research Fellow in Medicine, for the period January 1 through April 30;

Annette M. C. Rapin, Ph.D. as Research Fellow in Medicine, beginning February 1;

Dr. George M. Ricketson as Clinical Fellow in Orthopedic Surgery, for a period of three months, beginning January 2;

Dr. Norman Ronis as Research Fellow in Neurology, for the period January 1 through June 30;

Dr. Heinrich E. Seidel as Graduate Student Assistant in Orthopedic Surgery, for six months, beginning January 6;

Dr. Richard H. Smith as Clinical and Research Fellow in Psychiatry for one year, beginning July 1;

Dr. Richard J. Stenger as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Alfred D. Surtees as Clinical Fellow in Anesthesia and Acting Chief Resident in Anesthesia, for the period January 1 through July 24.

Dr. Alfred J. Luessenhop was promoted to the position of Clinical Assistant in Neurosurgery on January 1, *not* in Neurology, as reported in the last issue of THE NEWS.

⁂

TUMOR CLINIC

The Tumor Clinic, established by Dr. George W. Holmes as a consultation service, was legalized by formal title in 1925. As a clinic, organized under Dr. Robert B. Greenough, it has become the prototype of numerous similar groups set up in hospitals throughout the country. Meanwhile his "table of organization" which included members primarily from the Departments of Dermatology, Surgery, and Radiotherapy, and later from the Departments of Medicine, Pathology, Otolaryngology, Urology, and Neurosurgery was changed by additional appointments from the Orthopedic, Gynecologic, and Dental Services. However, changing personnel, varying patterns of activities, and the impact of numerous other accredited clinics have modified the complex relationship of clinic and hospital here and throughout the country.

All of the successors of Dr. Greenough were associated at some time with the Collis P. Huntington Memorial Hospital. Dr. Greenough, Dr. Channing C. Simmons, and then Dr. Ernest M. Daland headed the clinic in turn until 1946. For the next ten years Dr. Grantley W. Taylor was the chairman and Dr. Ira T. Nathanson co-chairman. When Dr. Taylor retired in 1957 Dr. Claude E. Welch was appointed Chief, and Dr. John W. Raker Associate Chief. The direction of the clinic is assigned to the Tumor Clinic Committee and also includes Drs. Laurence L. Robbins and Milford D. Schulz, representing the Department of Radiology, Drs. Paul C. M. Zamecnik and Rita M. Kelley, the Department of Medicine, Dr. LeRoy A. Schall, the Eye and Ear Infirmary, and Dr. Benjamin Castleman, the Department of Pathology.

The Massachusetts Eye and Ear Infirmary has been closely associated with the clinic since 1925. Dr. D. Crosby Greene and Dr. Harry A. Barnes were the original members from that hospital. Dr. Edwards W. Herman was in active charge and continued his otolaryngological duties until V-J Day. Associated with him from the inception were Drs. Carl H. Ernlund and LeRoy A. Schall.

The clinic, which has been set up in

close proximity to the Radiotherapy Department, is bursting at the seams, and physical expansion is essential for the near future. The patient load is enormous. A total of 9,725 new and subsequent visits were made to the Tumor Clinic in 1956. This number is surpassed in the Out-Patient Department by only the general medical and general surgical clinics, where 26,000 and 13,000 patients, respectively, were seen.

In order to accommodate our patients in the present cramped quarters, the clinic is open mornings and afternoons five days a week to segregate special groups of patients and consultants. On Friday afternoons the survivors of the old Huntington Clinic are still seen, and the Huntington plan, by which private patients are treated with all the advantages of the easily available consultations of the clinic, is being re-expanded under Dr. Raker's direction.

The smooth functioning of the clinic is due to many factors. There is a large Visiting Staff who have had special training in cancer, particularly by association with the Pondville Hospital. For several years a Clinical Fellow in Cancer has been appointed through a grant from the American Cancer Society — Dr. D. Albert Young being the present incumbent. These Fellows often continue to visit the clinic after the completion of their appointed year. In addition, the Nursing Staff, headed by Miss Isadora Glann, and the Social Service Department, now represented by Miss Barbara Willes, make invaluable contributions to the care of patients.

The Tumor Clinic conference now holds its weekly meeting in the Bigelow Amphitheatre each Wednesday at 12 o'clock, since the crush of visitors has outmoded the old conference room on White 2. Problem cases from various wards of the Hospital and from the clinic are discussed by consultants who are available from all departments of the clinic.

In addition to these specified activities many other projects are sponsored by the clinic. One of the most important involves close liaison with the house staff. Surgical residents are not required to consult with members of the clinic but can obtain advice readily, as well as operative assistance or direction, from surgeons of the clinic who are qualified in particular fields. Physicians may obtain opinions from the Huntington group, which is under Dr. Zamecnik, or from the members of the clinic who are particularly interested in chemotherapy.

Clinical research is constantly in progress. Of the many projects that have not yet been completed, those inaugurated by the surgeons of the clinic may be cited. Drs. Taylor and William P. Rogers, Jr. are continuing their studies on the results of therapy of cancer of the breast by radical mastectomy. Dr. Gerald G. Garcelon has just presented a study of salivary gland tumors at the annual American Cancer Society lecture given in the Memorial Hospital, New York City. Dr. Chester J. Dexter is investigating cancers of the floor of the mouth and carotid body tumors. Dr. Frank C. Wheelock, Jr. has completed an investigation of suture line implantation of cancer after resection and anastomosis of the colon. Dr. Gordon A. Donaldson has just presented data on perforated cancers of the colon to the New England Surgical Society. Dr D. Albert Young is collecting and analyzing the records of our chordoma patients. An end-result study of cancer of the lung is being made by Drs. J. Gordon Scannell and Earle W. Wilkins, Jr. Dr. William C. Quinby, Jr. is investigating sarcoma of the soft tissues, and malignant disease in infants and children. Dr. George L. Nardi is studying the free amino acid contents of normal and neoplastic tissue in man, and the elevation of serum trypsin in carcinoma of the pancreas. He also has devised a method of treatment of cancer of the esophagus, consisting of total thoracic esophagectomy and colon replacement. Dr. William V. McDermott, Jr. is continuing his studies of cancer of the pancreas, liver, and thyroid. Dr. Welch, in conjunction with Dr. Wilkins, is completing an extensive review of our patients with cancer of the stomach, and, with Dr. Ralph C. Darling, Jr., of those with small bowel tumors.

The boundary between clinical and laboratory research has become increasingly vague. Several projects involve the use of both facilities. The Cytological Laboratory, under the direction of Dr. Priscilla D. Taft since Drs. John B. and Ruth M. Graham left for Roswell Park Institute in Buffalo, continues its investigations. Drs. William H. Baker, John G. Freymann, William D. Sohier, Jr., and Rita M. Kelley have procured interesting data from metabolic studies on patients under treatment by hormones or therapeutic agents. They are also utilizing patients of the "hormone-breast" and lymphoma clinics for clinical research studies under generous grants from the U.S. Public Health Service, as part of a national program seeking improved therapeutic techniques for the palliative treatment of these patients. Dr. Raker is initiating a detailed study of cancer cells in the blood stream, and has recently visited other institutions in this country where this work is under investigation. Drs. Raker, George S. Richardson, and others are engaged in setting up a research program to investigate the significance of metastatic cancer of the breast in internal mammary nodes. Dr. Richardson is investigating the complex problem of tumor immunity, and, with Dr. Lewis L. Engel, is carrying out fundamental work in metabolism of estrogenic hormones on patients with and without malignant disease.

The relationship of the Huntington Laboratories and the Tumor Clinic has always been close. Policies formulated by Dr. Joseph C. Aub have been continued by Dr. Zamecnik. Some current problems of investigation are being pursued in both areas.

There also has always been and there must continue to be a very close relationship between the Tumor Clinic and the Department of Radiotherapy. Physically they share facilities, and functionally their activities cannot be divided. Both are oriented directly toward the care of patients with malignant disease and the training of young physicians in the care of such patients. At least one member of both the resident and senior staffs of the Department of Radiology is in regular attendance in the Tumor Clinic.

With our active program of clinical research, it is fortunate that the American Cancer Society has, by an additional grant, provided us with a research secretary, Miss Green, who is available to the staff. At the present moment, fettered in her small pigeonhole, she hopefully awaits relief by the administration.

In addition to the teaching program that has been outlined above, a formal course is given to Harvard Medical students in their fourth year. This was a very popular elective when it was conducted by Dr. Nathanson. After a temporary decline, increased interest is again being shown by the students. Dr. Edward D. Churchill, the cancer coordinator for the Medical School, integrates the teaching throughout various hospitals. At present 12 students are taking the course under the direction of Dr. Zamecnik and Dr. Richardson.

Despite these activities, it must be realized that the Massachusetts General Hospital is only one of over 700 hospitals in this country that have similar clinics which are recognized and approved by the American College of Surgeons. Since the days of Dr. Greenough many important hospitals have been erected and dedicated solely to the care and investigation of patients with cancer. Where before we were only one, now we are one of many, and the competition from other clinics has made it difficult to retain what we believe is the traditional aura of leadership of the Massachusetts General Hospital. For example, in the coming year, follow-up records of all patients with malignant tumors entering this Hospital, private as well as ward, must be established. It is hoped that this file will function with a minimum of inconvenience, since individual doctors will be asked to supply information about the condition of their cancer patients at yearly intervals. Such material should be easily available and will supply invaluable information in the study of this disease. Mrs. Brady has been placed in charge of this record system which has just been activated. The wholehearted and effective support of the entire staff will be necessary to obtain these data and thereby maintain our position.

Claude E. Welch, M.D.,
Visiting Surgeon
and *Chairman of the Tumor Board*

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Dermatology

Lever, W. F., and Klein, E.
Untersuchungen ueber die Pathogenese der idiopathischen Hyperlipaemie.
Dermatologica 115:579-586, 1957.
Spangler, A. S.
New treatment for pitted scars: Preliminary report.
A.M.A. Arch. Dermat. 76:708-711, 1957.

General Surgery

Barnes, B. A., Krane, S. M., and Cope, O.
Magnesium studies in relation to hyperparathyroidism.
J. Clin. Endocrinol. & Metab. 17:1407-1421, 1957.
McDermott, W. V., Jr.
Medical progress: Metabolism and toxicity of ammonia.
New England J. Med. 257:1076-1081, 1957.
McDermott, W. V., Jr.
A simple discriminatory test for upper gastrointestinal hemorrhage.
New England J. Med. 257:1161-1164, 1957.
Zuidema, G. D., and Clarke, N. P.
A pulse simulator for the study of flash burns.
J. Appl. Physiol. 11:487, 1957.

Hematology

Hays, E. F., Simmons, N. S., and Beck, W. S.
Induction of mouse leukaemia with purified nucleic acid preparations.
Nature 180:1419-1420, 1957.

Ophthalmology

Liebman, S. D.
Riley-Day syndrome (familial dysautonomia): Concerning the etiology of the corneal pathology; an ocular survey of nineteen cases.
A.M.A. Arch. Ophth. 58:188-192, 1957.

Physiology

Blank, I. H., Griesemer, R. D., and Gould, E
The penetration of an anticholinesterase agent (sarin) into skin. I. Rate of penetration into excised human skin.
J. Invest. Dermat. 29:299-309, 1957.

Psychiatry

Lorenz, M.
Expressive form in schizophrenic language.
A.M.A. Arch. Neurol. & Psychiat. 78:643-652, 1957.
Wolf, I.
Hostile acting out and Rorschach Test content.
J. Project. Tech. 21:414-419, 1957.

Miscellaneous

Garland, J.
Editorial responsibility for medical advertisements.
New England J. Med. 257:1117-1120, 1957.

This is the last issue of THE NEWS in which 1957 titles will appear.

MASSACHUSETTS EYE & EAR INFIRMARY

STAPES MOBILIZATION OPERATION FOR THE IMPROVEMENT OF HEARING IN OTOSCLEROSIS

Otosclerosis is a condition which produces deafness in human beings only. It is a disease which may affect any part of the bony labyrinth. When this disease affects a certain part of the labyrinth in the region of the oval window in which the stapes lodges, then and then only does hearing become affected. The pathological changes begin first with an increased vascularization of the area involved and absorption of the bone. This first stage is followed by redeposition of calcium in an unorthodox arrangement which characterizes it pathologically—with staining characteristics which distinguish it sharply from the surrounding normal bone.

The cause of otosclerosis is unknown. There is definitely an inherited factor present, as it frequently occurs successively in families. It is a disease which appears most commonly in females, and chiefly between the ages of twenty and forty. Otosclerosis develops insidiously, is hardly noticeable at its onset, is slowly progressive, and ultimately leads to rather profound deafness. Both ears are usually involved. The condition in one ear may progress more rapidly than in the other but, as time goes on, the loss becomes bilaterally equal, and is frequently accompanied by tinnitus and occasionally by vertigo.

There have been many efforts over the past seventy-five years to improve hearing by surgical measures. Some of these procedures were very well conceived but, because of inadequate illumination and magnification, and poor asepsis, the improvement did not last. Enthusiasm and hope engendered by early reports gave way to discouragement and final abandonment. For more than fifty years thereafter otologic literature was completely devoid of reference to procedures upon the stapes as a means of improving hearing.

Brief historical review of surgery in otosclerosis: It was well recognized by otologists in the 1870's that hearing is impaired as a result of scar tissue, following infections of the middle ear space, which impedes sound transmission to the inner ear. They also recognized deafness due to bony fixation of the stapes in the oval window, which is unrelated to infection. This is called "chronic otitis insidiosa". It was Kessell, in the early 1870's, who advised removing the drum membrane, including the malleus and incus, to relieve the obstruction in the middle ear. This procedure was subsequently abandoned, but it was the first attempt to improve hearing by surgical means. Some years later, in 1888, Boucheron of France published his procedure known as the stapes mobilization. This was the first time this term had been used. His technique was improved upon in 1892 by Miot, also of France, who was the first to describe in minute detail from beginning to end the entire procedure of stapes mobilization for any obstruction to the passage of sound waves to the inner ear. In this report on several hundred patients, there were included the records of many who were suffering from otosclerosis. In this country, Drs. Frederick L. Jack and Clarence Blake, surgeons at the Massachusetts Eye and Ear Infirmary, were the first to perform middle ear surgery for the improvement of hearing. After the initial procedure of complete removal of drum membrane, malleus, and incus, the surgery was extended to actual manipulations upon the stapes itself. By 1888 the drum and ossicles were no longer excised. Instead, an incision was made in the drum membrane, adhesions due to scar tissue were severed, and the tendon of the stapes was also severed. Later, Miot directed his attention to the stapes itself, and tried to loosen it in order to re-establish its mobility to sound pressures. Drs. Jack and Blake went a step further and actually removed the stapes from the window. By 1900 the results of these surgical procedures could not withstand the severe criticism of some of the leading otological authorities, and for a time nothing more was heard of stapes mobilization. In 1952, after a lapse of fifty years, Dr. Samuel Rosen of New York published a report on five patients with hearing improvement following stapes mobilization.

It is very interesting how this rediscovery of the stapes mobilization occurred, for the course of events leading to it was quite accidental. Approach to the contents of the middle ear heretofore had been by means of an incision through the drum. This was an undesirable approach. Dr. Julius Lempert of New York, seeking a means of relieving tinnitus, believed that the tympanic plexus of nerves lying on the medial wall of the middle ear was one of the causes producing it. He believed this was true because when the tympanic plexus was destroyed by chronic disease of the middle ear, tinnitus rarely was present. Since he was the originator of the endaural incisions technique for entry into the middle ear, he made an incision 7 or 8 mm. lateral to the drum membrane in the canal wall membrane from approximately 3 to 9 o'clock. He elevated the canal wall membrane and its attached drum from their bony attachments, exposing the middle ear beautifully. However, Lempert discarded this procedure, as it failed to accomplish relief from tinnitus, which had been his aim.

Dr. Rosen believed that tinnitus and vertigo could be relieved by severing the chorda tympani nerve. He performed this operation on many patients, but with such questionable results that the procedure was not attempted by many other otologists. In exposing the middle ear space, Rosen obtained an excellent view of the incudostapedial articulation and of the stapes in many patients. On one occasion, in operating upon a patient with otosclerosis and tinnitus, Dr. Rosen was about to sever the chorda tympani nerve, when he accidentally mobilized the stapes. As this operation was being performed under local anesthesia, the patient was able to suddenly cry out that he could hear everything that was going on in the operating room. Rosen, knowing the degree of deafness that had been present, tested the patient's hearing while he was still on the table and observed that actually there was an improvement. This not only surprised him, but impressed him tremendously. He attempted the same procedure in other patients suffering from otosclerosis, and although the results were unsuccessful, his initial observation encouraged him to continue and, in doing so, the same phenomenon occurred — immediate improvement of hearing, while the patient was still on the table, when the stapes was successfully mobilized. He hastened to report these observations, and I believe a paper on his operation was published in 1952 in the *New York State Journal of Medicine*. Full credit has been given to Dr. Rosen for the rediscovery and revival of this operation, which is today the most popular and most frequently performed type of surgery for the improvement of hearing in otosclerosis. The operation as described by Dr. Rosen is as follows: After light preoperative sedation, and with brilliant illumination and under two-power magnification, and with local anesthesia, using 1% or 2% zylocaine or novocain solution to which has been added 5 minims of adrenalin per c.c., the canal wall membrane is injected with ½ to 1 c.c. of the solution. This produces complete anesthesia. A circumferential incision is made from approximately 12 to 6 o'clock, posteriorly 7 to 8 mm. lateral to the drum membrane. The canal wall membrane and the drum are elevated gently and cleanly from their bony attachment. This exposes the middle ear space. The high-powered Zeiss operating microscope is now used for the subsequent manipulations of the stapes.

Rosen initially applied pressure to the neck of the stapes, but he has now modified his technique. If he finds that the stapes is immovable by the first maneuver, he makes direct pressure upon the footplate of the stapes. If this fails, a window is cut through the footplate. The hearing is tested after each manipulation. Under high magnification the movement of the stapes is quite easily discerned. At the completion of the manipulations, the drum and the canal wall membranes are laid back in their original position and held with various materials, until re-union with the canal wall has taken place. At the end of a week or ten days, the packing in the external auditory canal is removed and the hearing tested.

When a report on Rosen's operation was first published, there was an immediate reaction against it. It was inconceivable to many otologists that the stapes in this diseased area could remain mobilized. However, Rosen was not easily deterred and, as his technique improved, the number of patients successfully operated upon increased. He traveled far and wide demonstrating his procedures. The phenomenon of immediate hearing improvement while the patient was on the table was witnessed by many observers.

It was not long before world-wide interest was aroused in the revival of this operation, and innumerable modifications of the Rosen operation have been developed. These modifications of technique, wherein an attack is made upon the otosclerotic area by means of chisels, burs, needles, etc., are truly heroic and not without risk to cochlear function. Because these manipulations of the footplate endanger the structures within the inner ear, there has been an increase in the number of complications. Vertigo, labyrinthitis, tinnitus, total loss of hearing, trauma to the facial nerve with temporary and, on occasion, permanent partial facial paresis have been reported.

The indications for the operation are practically the same as those for the fenestration operation. It is indicated primarily in patients with otosclerosis, where the cochlear nerve function is good. There are many reliable tests to determine the residual cochlear function. The drum membrane and the ossicular chain must be intact. However, scarred and healed perforations of the drum membrane are not contraindications, if it can be established that the hearing loss occurred subsequent to the infection. The patient should be fully informed as to what the operation attempts to do. Beautiful charts illustrating the structure of the ear are available, which make it possible to explain to the patient why he does not hear. They also help in explaining why there is no way of predetermining what the result will be following the attempt to mobilize the stapes. The chances of success or failure are explained, as well as the chance of postoperative complication. If the patient is not fully informed and the surgical attempt to improve the hearing is a failure, the reaction of disappointment to the patient may be very severe.

The surgeon must be prepared to perform the various manipulations step by step. Testing of the patient on the operating table, either by live voice or by means of an audiometer, will usually indicate whether the mobilization of the stapes has been successful. The hospital stay is usually two days. Occasionally, because of vertigo, an extra day or two is necessary.

From world reports in the literature, including that of the Winthrop Foundation at the Massachusetts Eye and Ear Infirmary, it appears that hearing for 35%

No. 73 in a series of Staff photographs
Dr. Claude E. Welch, Visiting Surgeon — Chairman of the Tumor Board

to 45% of the otosclerotic patients is successfully improved to a level of 30 decibels or better, for both speech and pure tones. When we speak of improvement of hearing to the 30 decibels level or better, we mean that the patient no longer needs a hearing aid and he is socially and economically rehabilitated.

Because the stapes mobilization procedure retains the normal physiological pathway for sound transmission, it is not surprising that, for many patients, hearing returns to normal.

Advantages of the stapes mobilization operation are:

a. Incapacitation of the patient is limited — rarely over two days of hospitalization.

b. No postoperative aftercare is necessary, other than removing the packing from the external canal.

c. Postoperative effects are minimal.

d. The operative procedure may be repeated if regression of hearing improvement occurs.

e. The patient may have the fenestration operation if the stapes operation is a failure.

If the initial hearing improvement is not maintained, the regression is usually due to fibrosis, as it is believed that healing of the otosclerotic bone does not occur.

Complications are:

a. Loss of the sense of taste at the side of the tongue may occur. This is due to trauma or severance of the chorda tympani nerve which lies directly in the field of operation.

b. Permanent perforation of the drum membrane may occur; also tinnitus, vertigo, and, as already mentioned, temporary or partial facial paralysis, but this is very rare.

With regard to the permanency of hearing improvement, it appears that in patients who have had their hearing improved to a practical, serviceable level, 70% can expect the improvement to be maintained. At least 15% to 20% may expect the hearing to recede from the high level of improvement, but it will remain improved over the preoperative level. About 10% to 15% may expect the improvement to recede to the preoperative level.

The revival of stapes mobilization as a surgical procedure for the improvement of hearing in patients with otosclerosis is certainly a step forward. To Dr. Julius Lempert must go the credit for introducing his techniques for modern temporal bone surgery, which include fenestration and tympanoplastic procedures. To Dr. Samuel Rosen goes world-wide acknowledgment for the revival of the particular procedure of stapes mobilization. To Drs. Zollner and Wullstein credit must be given for introducing under high magnification the surgical techniques for improvement of hearing in chronic otitis media. With these surgical developments, plus the advances in psychoacoustics and in neurophysiology, there is increasing hope for the alleviation of deafness in those so afflicted.

Philip E. Meltzer, M.D.,
Surgeon for the Service for the Deaf

New addresses:—

Dr. Irving P. Ackerman (*M.* 1951), Warren Bldg., Massachusetts General Hospital, Boston 14, Mass.
Dr. Bob Bullwinkel (*S.* 1957), 313 Melton Rd., Warrington, Fla.
Dr. Howard S. Cameron (sr. r.s. *Or.* 1957), 450 Central Ave., London, Ontario, Canada
Dr. Sheo-Nan Cheer (*E.M.* 1922), House 1001 VAC, VAC Medical Service, Martinsburg, W. Va.
Dr. Lewis Cozen (*Or.* 1938), 6221 Wilshire Blvd., Los Angeles, Calif.
Dr. Thomas M. Foley (*Or.* 1915), 140 Quince St., San Diego, Calif.
Dr. John H. Kennedy (*S.* 1950), 7755 Fay Ave., La Jolla, Calif.
Dr. Joseph S. Lichty (a. dir. 1950), Akron General Hospital, 400 Wabash Ave., Akron 7, Ohio
Dr. Kasian Lim (a.r.s. 1957), Cuyahoga County Hospital (formerly Cleveland City Hospital), Cleveland 9, Ohio
Dr. Harold L. May (*S.* 1954), Hospital Albert Schweitzer, P.O. Box 4, St. Marc, Haiti
Dr. Remedios K. Rosales (r.p. *N.P.* 1952 & a.r.p. *Path.* 1954), University of Santo Tomás, Manila, P.I.
Dr. Shen Kuang Wang (a.r.s. *Or.* 1957), Children's Medical Center, Boston, Mass.

* * *

Brief bits:—

Dr. Edwin F. Cave has been elected President of the American Board of Orthopedic Surgery.

Dr. Edward D. Churchill is in India, on a mission sponsored by the Rockefeller Foundation. At present he is at the Medical College in Lucknow, with Professor Sharad C. Misra, who was a Consultant in Surgery pro tempore here at Massachusetts General in 1953-54.

Dr. Oliver Cope is to be the George A. Ball Visiting Professor for one week in the School of Medicine, Indiana University, beginning March 12. On March 14, he will deliver the Burton D. Myers Lecture before the Nu Sigma Nu Fraternity, Indiana University. His subject will be "Cushing's disease: Experiences harvested in the surgical care of 54 patients". On March 18, he will lecture to the Indianapolis Medical Society on "Nontoxic nodular goiter: The limitations of both surgical and medical treatments".

Dr. John W. Raker was invited to speak at the Thirteenth Annual Postgraduate Course in Surgery, presented by the University of Kansas School of Medicine on January 20. The title of Dr. Raker's talk was "Experiences gained in the study of medical management of civilian disasters".

Dr. Leonard D. Rosenman (*E.S.* 1943) has been appointed Chief of Surgery at Mount Zion Hospital in San Francisco. Dr. Rosenman's office address is still 2320 Sutter Street, San Francisco 15, California.

THE MASSACHUSETTS GENERAL HOSPITAL 1811 NEWS

No. 176 Boston, Mass. April 1958

SOME PRINCIPLES OF MENTAL HEALTH AND THEIR SOCIAL IMPLICATIONS

I shall try to make no claims in this article for knowledge that we do not possess; in other words, I shall try to do what Santayana used to recommend, i.e., *to define the limits of our ignorance.* We have as yet no practicable preventive measures for mental illnesses in the sense that we have them for such diseases as typhoid or typhus or malaria. It would be fine if we had, but the regrettable fact is that we have not. The reason for this is obvious. Our knowledge of specific etiology in mental illness is in many instances quite incomplete. By and large, though not always, the possibility of effective prevention depends upon precise knowledge of cause.

There are, of course, exceptions to this rule. Bubonic plague and leprosy had largely vanished from the Western World before their specific etiological agents were discovered. This resulted undoubtedly from a general improvement in standards of living, with better housing and more widespread habits of cleanliness. Similarly, the incidence of such nutritional disorders as scurvy and rickets decreased as the general quality of diet improved before the significance of vitamins C and D was recognized, or, indeed, the vitamins themselves had been identified. It is not difficult to furnish other examples of the empirical discovery of preventive, even of therapeutic, measures in advance of more precise, controlled scientific knowledge. We can say, therefore, that even in the absence of specific etiological knowledge, man has achieved certain advances in the state of his well-being and in the prevention of illness by means of general improvements in his diet, in his habits of cleanliness, and in his living conditions. These advances have, in turn, been facilitated by public education and enlightenment, and good example.

I am sure that the analogy between these facts and the general facts of mental illness is obvious. Let us, for a moment, examine more closely the state of our knowledge of the causes of mental illnesses. It is admittedly far from adequate. This is perhaps especially true of the two large groups of major psychoses, i.e., those disorders of mood known as "manic-depressive", and those of disorders of thinking known as "schizophrenic". These, especially the latter, are responsible for the bulk of the patient load in our mental hospitals. The incidence of schizophrenic disorders is remarkably constant in different communities. There is a suspicion, but as yet not more than a suspicion, that manic-depressive attacks are the result of still unexplained metabolic disturbances. Evidence, as yet tentative and preliminary, that certain chemical agents in the body may be related to what we recognize as schizophrenic reactions is gradually being accumulated. Critical investigation is urgent here — and an open mind. The burden of proof rests on the shoulders of the dogmatic — those who insist with so much assurance that all is physical or all is mental. It is highly probable that in these psychoses, as indeed in many other illnesses not of a mental nature, we are dealing with *multiple causation.* This is certainly true of "psychosomatic" disturbances such as peptic ulcer, bronchial asthma, and arterial hypertension, in which emotional causes and pathological-physiological ones combine to bring about the morbid result. It is also true even of the common infections. It takes more than the pneumococcus to cause pneumonia. Indeed, the pneumococcus is always with us — always present in the upper respiratory tract — but under certain circumstances only does its virulence increase or is the resistance of the host lowered sufficiently to permit the development of a full-blown attack. Predisposing factors can include not only exposure to cold, fatigue, exhaustion, and alcohol, but probably also to intense emotional disturbance. There is ample evidence that emotional forces can play a contributory role in the onset of an active tuberculosis infection.

Multiple causation is especially valid in mental illness — a fact which must be kept in mind in any program of prevention. One must look for hereditary and constitutional factors, for anatomical lesions, for infectious and toxic agents, and also for cultural, economic, societal, and familial influences. In few mental diseases is any one factor sufficient to account for the entire process. Although syphilis is known to be caused by the *Treponema pallidum,* who could deny that a primary syphilitic lesion results from cultural or personal as well as infectious causes? It is reasonable to assume, for the present at least, that schizophrenic and cyclothymic disturbances spring not only from chemical and perhaps constitutional sources, but also almost certainly from environmental ones as well. Given a certain kind of make-up, a sensitive, withdrawn child can turn either into an autistic (or perhaps schizophrenic) individual, or possibly, with wise and intelligent handling, into a creative member of society even though he may remain sensitive and withdrawn.

It seems paradoxical that the very neuropsychiatric illnesses about which we have the most precise knowledge, as far as brain localization is concerned, are frequently those we can do the least about therapeutically. I refer here to organic brain syndromes, to irreversible changes in the cortex due to infection, new growths, trauma, arteriosclerosis, and to hereditary or congenital defects. Even when the site of difficulty is known, we are often powerless to provide a remedy because, once the brain cells have been destroyed, they cannot regenerate.

The psychoneurotic illnesses offer a field in which the possibilities of prevention are more hopeful. Here, although our knowledge is less precise, and although we cannot localize the cause of illness in any part of the central nervous system or elsewhere in the body, we can still at times effect something approximating a cure. Indeed, I believe that if we could apply the knowledge that we now possess — incomplete though it still is — we could strike a mighty blow for freedom from one of the most insidious, all-pervading, and destructive enemies that afflict man. We may think of psychoneurosis as a minor ailment, but it assuredly is not. It affects the relationship of individuals in their work and their love, and decreases their capacity for enjoyment and for living useful and productive lives. It is responsible for more unhappiness, despair, and waste than almost all other types of illness. It affects our health and is largely at the root of a great variety of psychosomatic disturbances. It comes between man and wife, between parent and child, and is passed on from one generation to the next partly through imitation, partly through direct influence. It often has the appearance of an hereditary trait, but there is no evidence for this. Instead, there is a kind of pseudo-heredity, not the result of transmission by genes, but rather the result of early environmental influences. These psychoneurotic distortions of human character are responsible for more than personal and individual suffering. I believe that much of the political unrest and international hostility and strife from which man has always suffered can be laid at the door of psychoneurosis.

Before proceeding further, I shall attempt to define what I mean by psychoneurosis. Precise definition is difficult because the manifestations of the disorder are so varied. The term is here used in a broad sense to cover disturbances of mental and emotional functioning which are not associated with gross demonstrable damage to the brain or central nervous system. In essence, a psychoneurosis may be considered to represent a fault in the adaptation of an individual to his environment, manifested principally in the character and quality of his personal relationships. This fault in adaptation results from a disturbance in emotional growth and development. An individual so handicapped cannot progress without great difficulty from one stage of growth to the next, or, if he does, he will have a strong tendency, in the face of frustration, to regress or return to earlier and more primitive modes of adaptation. The psychoneurotic drags with him outworn and useless equipment from his past, which not only burdens his present but shapes his future, as if by fate, because it produces a compulsive need to repeat the same mistakes over and over again.

The passions, appetites, and impulses of childhood survive relatively unaltered in the deeper layers of the mind of such a person, only to be met with the strictest prohibition. The conflict of these opposing forces produces a state of inner tension in him so that he becomes the battlefield of a civil war, and much of his energy must be spent in keeping his own destructive impulses at bay and in erecting defenses — often in the form of symptoms and symptomatic acts — against his own anxiety. If a person in this condition could be relieved of his neurosis, the energy expended in such self-protective devices would be freed and could then be put to the service of reality. Better still, of course, is prevention of such conflicts so that this energy may consistently remain available for growth and adaptation to the demands of the environment.

In many respects and in more or less degree everyone is neurotic — even those of us who are free from symptoms. The late Professor Victor von Weizsäcker of Heidelberg coined the word "normopath" to describe the average so-called healthy individual. The fact is that we have not yet learned how to bring up children without inflicting on them some neurotic distortions of character. A certain degree of infantile neurotic anxiety seems to be ubiquitous in our culture. This is perhaps inherent in the utter helplessness of the human infant and in his relatively long period of dependence.

Fortunately, we are somewhat better equipped today than we were, say fifty years ago, to prevent such neurotic distortions of character in children. Insights obtained from dynamic psychiatry, if properly applied to the rearing of children, could, I am certain, prevent much invalidism, crime, delinquency, perversion, alcoholism, drug addiction, misery, discord, and divorce. Modern psychological discovery has demonstrated in a convincing fashion that for the human child, other beings — especially the mother — constitute the most important element of the environment. There can no longer be much doubt that, broadly speaking, an infancy spent in a complete, stable, loving family is the necessary foundation for healthy human development. Psychopathology and unhappy parent-child relationships are, in a sense, inseparable(1). The symbiotic bond between mother and infant does not end with the cutting of the umbilical cord. Unless the baby falls into welcoming and tender arms it cannot thrive. If it is weaned too soon or not allowed to satisfy its sucking needs sufficiently, or if it is trained too early, or disciplined before it is ready for discipline, the tensions created will very likely follow the child throughout life. More than that, unless some of the most primitive and urgent impulses can be satisfied during infancy, the chances are that they will persist in their crude, untamed form in the unconscious and will not be reworked and refined in later life to become available for creative purposes.

Unfortunately, we cannot provide the perfect family for every newborn infant, nor the perfectly patient and loving mother. This should not deflect us, however, from the pursuit of truth, because that alone must guide us in our plans to improve the mental health of a community. Obviously, we cannot wait for the perfect pair to have the perfect baby and then elect him President. We must begin with the here and now, and work with individuals of all ages. Each age has its particular vulnerabilities and problems.

I have already outlined some of the needs of infancy. If these are not met they will continue to assert themselves and to interfere with later emotional development. This is especially true at certain critical times in life: early childhood, when the conscience begins to develop; adolescence, when sexual needs reassert themselves and the struggle for independence and self-identity is so urgent; young adulthood, when one must make one's way in the world; marriage and parenthood, with all their vicissitudes; and the climacterium and old age in both sexes, when everyone must learn to accept failing physical and perhaps mental powers. The success we have in passing through each of these stages of development will depend in the long run on how we have fared in the previous ones.

Those who are interested in mental health must direct their chief efforts toward protection of the family against the strains and stresses which assail it. This requires some understanding of the ingredients of a good marriage, and of those forces which are likely to upset it. The most important interference with good conjugal relations appears to stem from disappointment in the way a marital partner plays his expected role. Individuals who fail in marriage usually love and marry not a real person, but a more or less distorted image of their own inner fantasies. These fantasies are derived in large measure from early experiences and memories which cluster about the parents. Images and memories of parental unhappiness may cause tension in the minds of people who otherwise appear to be well adapted to life. Marriage is often the rock on which an individual founders. It is more difficult and more dangerous for many personalities than war, because it brings to light neurotic faults and distortions of personality which can remain undiscovered in other less searching situations. Even if they attempt to do so, a disturbed couple can rarely conceal their tension and hostility from each other or from their children, who, like all children, are extraordinarily sensitive to the emotional climate in which they grow up. All this is not to imply that one can or should expect parents to live in a state of perfect and sublime harmony, or that a family exists without its tensions, rivalries, and jealousies. To keep these within manageable limits is a valuable part of every child's experience, if he is to learn how to get along in the world.

As has been well said(1):

> Children internalize, in love or in fear and anger, what they see and feel about their parents, just as the parents had internalized the unhappy, angry, forbidding images of *their* parents. In this way the deprived child is likely to become an unsuccessful marriage partner in his turn. Thus an increase in the incidence of marital breakdown in a community will directly swell the numbers of conflict-torn, insecure children who have not learned to identify with "good parents". Because they have not done so, they will be unable to give out secure affection in adult life as fully as they should, in their marriages or in the wider sphere of social obligations. If this were to go on unchecked it is obvious that the danger to society would be great. It would be ironical if we were to see an advance in physical well-being (due to our efforts at prevention and hygiene) go hand in hand with a disintegration of social and personal relationships — that is, of mental health.

I believe that this need not happen if the facts become widely recognized and accepted, and if the concern of men and women of good will from all walks of life is enlisted. The prevention of mental illness and the safeguarding of mental health cannot be the prerogative of psychiatrists alone, who, by virtue of their professional training and experience, know more about mental illness than they do about mental health. An important contribution to this subject can be made by ministers, priests, and rabbis, and by teachers who come in close contact with young children and adolescents. Deans and professors in colleges and universities are becoming more and more aware of this aspect of their work, and so are business executives. Lawyers and judges, as well, who are constantly confronted by troubled individuals, and also obstetricians, pediatricians, and family physicians are in a strategic position; so are many others — social workers among them. All of these can play a significant part in preventing mental illness, but, most especially, the concerned and enlightened layman. This is a battle that must be waged on all fronts.

For success, we need to keep an objective in mind toward which to strive, even though it may remain beyond our reach. Mental health is a positive state — not merely the absence of mental illness. To define it is not easy, but it can be characterized as balance; as the capacity to derive satisfaction from love and from work and also to give satisfaction; as a certain willingness to accept life with all its disappointments and vicissitudes; perhaps as a kind of helpful alliance between conscious and unconscious forces in the personality so that they work in harmony with each other and not in conflict. Definitions by themselves do not, of course, provide the answers we seek. They are, therefore, never quite satisfactory. Our approach must, rather, be an operational one based on a study of individuals and the manner in which they function in their environments. Both the individual and his environment are constantly changing, and a series of fine adjustments is necessary to maintain the stability of the equilibrium which must exist between them.

I have already mentioned some of the changes that occur in the progress of an individual from infancy to adulthood. Many of these are, to be sure, responses to social stimuli or to what society expects. An adult, in our culture, does not run naked in the streets, even if he would like to do so, because such behavior would be discountenanced and is not expected of him. Society demands of us that our behavior be reasonably predictable. People who overstep commonly accepted limits are marked as deviants or psychotics, and frequently have to be deprived of freedom of action within the community. Some societies are, of course, far more liberal and tolerant of deviant behavior than others. Nazi Germany and Communist Russia are examples of illiberal and intolerant societies. Both succeeded in impressing their moulds on great numbers of people by starting the process early in life and permitting little variation in attitude or action. What this does to the mental health of the people who compose such societies we can only guess.

No wonder, then, that anthropologists and sociologists have had much to say to psychiatrists in recent years about the maintenance of mental health and the prevention of mental illness. They have begun by warning us of our own class-limited orientation. Most psychiatrists, engaged in private practice, come from middle-class backgrounds, as do their patients, and the social scientists question the ability of this specialized group to deal effectively with other social groups whose attitudes toward success and security, toward marriage and divorce, toward morality and social responsibility, toward love and sex are often so different from its own. What is true of other economic classes of society is perhaps even more true of other ethnic groups — especially of those in a minority.

Recent studies by Dr. Florence Kluckhohn(2) of the Department of Social Relations at Harvard and her collaborator, Dr. John Spiegel(3), illustrate some of the subjects I have alluded to in perhaps too general terms. Dr. Kluckhohn is well known for her theory of Value Orientations, and it is with this theory that they are operating in their researches. They are studying intensively families from three different ethnic groups in Boston: the old Yankee, the Irish-American, and the Italian-American. Within each of these three groups a good deal of consistency and uniformity is found in attitudes toward such things as time, place, and family.

The typical old-American is oriented toward the future, the Irish-American and Italian-American toward the present. The typical Yankee boy looks forward to leaving home — and is indeed expected to — and to setting up his own establishment and somehow to improve on his father's situation. The first, or even the second, generation Italian-American, on the other hand, is expected to stay near his parental home and maintain close ties, not only with his own family, but also with his uncles, and his cousins, and his aunts. And the first generation Irish-American is frequently kept under strict parental supervision and is not permitted the kind of freedom and experimentation characteristic for an adolescent in a typical old-American middle-class family.

Attitudes toward illness and seeking medical advice and going to hospital are markedly different in the different ethnic groups. An old-American comes to the hospital on the whole willingly, with the hope of preventing worse illness, and he comes with one other person, at most. An Italian-American seeks out a local doctor quickly enough when he is ill, but he does not realistically understand what help he can expect to get from specialists or from modern medical techniques. Also, when he does consent to enter a hospital, he arrives with a bodyguard of parents, siblings, and collaterals, and cannot comprehend why they are not permitted to stay.

Kluckhohn and Spiegel are able to set up norms for these ethnic groups, i.e., for the first generations; but with later generations, what with the influence of public schools and often with intermarriage, some deviation from these norms can be expected and predicted. It must be borne in mind, of course, that even in the so-called old-American stock one finds much variation. It is easy to see how tension within a family can arise from conflicts over such deviations from traditional values, and how what in other psychological dimensions might be explained in terms of the Oedipus complex can be enormously magnified and enhanced by this battle of the cultures.

Furthermore, no two children of such families or, indeed, of any family, encounter the same environmental conditions, or, for that matter, with the exception of identical twins, the same genetic inheritance. This can be accounted for partly by the acculturation of parents and older siblings and also by the relationships which vary with each child's personality and position in the family.

What has been said of ethnic variables could also be said of social and economic ones. The work of the late Dr. Thomas A. C. Rennie and his collaborators at the New York Hospital(4), of Hollingshead and Redlich at Yale(5), and finally of Lindemann and his group in this Hospital(6) should provide us with valuable and needed information concerning these relationships. It is, of course, difficult to separate out ethnic, social, and economic influences, as can be seen, for example, in the case of recently arrived Puerto Ricans and of Negro migrants from the South.

In a large general hospital such as this one, where people of many different ethnic and economic backgrounds come for help, there is an admirable opportunity to explore the multiple causes of mental and emotional illness — especially of the psychoneuroses, whose manifestations are protean and whose effects can be so destructive to health, well-being, and a good life.

Carl A. L. Binger, M.D.,
Member of the Board of Consultation

The Board of Trustees, at their meeting on February 5, voted:

To rescind the appointment of Dr. Walter Kaupe as Resident in Psychiatry at McLean Hospital, as of July 1.

To appoint:

Dr. Habibolah Davanloo as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. Elwin W. Donnelly as Second Assistant Resident in Radiology, beginning January 1, 1959;
Dr. Paul E. Gaver as Assistant Resident in Anesthesia, beginning July 1;
Dr. Harry S. Olin as Assistant Resident in Psychiatry for one year, beginning July 1;
Dr. Robert S. Richards as Assistant in Radiology, beginning July 1;
Dr. Phelps M. Robinson as Resident in Psychiatry at McLean Hospital, beginning July 1;
Dr. Chiu-chen Wang as Assistant Radiologist, on completion of his service with the Armed Forces, approximately July 1;
Dr. Walter P. Zmyslowski as Assistant Resident in Anesthesia, beginning September 1.

At their meetings on February 4, 12, and 19, the General Executive Committee voted:

To promote, as of July 1:

Dr. Louis H. Edmunds, Jr. to the position of Second Assistant Resident in Surgery;

Dr. Edward L. Ferguson to the position of First Assistant Resident in Surgery;

Dr. Moses J. Folkman to the position of Third Assistant Resident in Surgery;

Dr. Abdollah Gashgai to the position of Third Assistant Resident in Surgery;

Dr. Jack J. Greenberg to the position of Second Assistant Resident in Surgery;

Dr. John W. Grover to the position of Second Assistant Resident in Surgery;

Dr. John B. Herrmann to the position of Third Assistant Resident in Surgery;

Dr. Dale G. Johnson to the position of Second Assistant Resident in Surgery;

Dr. Mark M. Kartchner to the position of Third Assistant Resident in Surgery.;

Dr. John L. Lewis, Jr. to the position of Third Assistant Resident in Surgery;

Dr. Donald M. McKee to the position of Second Assistant Resident in Surgery;

Dr. Alfred E. Miller to the position of Second Assistant Resident in Surgery;

Dr. Anthony P. Monaco to the position of Second Assistant Resident in Surgery;

Dr. Gustave C. E. Mueller to the position of Third Assistant Resident in Surgery;

Dr. John P. Remensnyder, Jr. to the position of Third Assistant Resident in Surgery;

Dr. Farrokh Saidi to the position of First Assistant Resident in Surgery;

Dr. William L. Strickler to the position of Second Assistant Resident in Surgery;

Dr. George M. Williams to the position of Third Assistant Resident in Surgery.

To appoint:

Dr. Jan Nielubowicz as Clinical and Research Fellow in Surgery for one year, beginning January 1;

Dr. Norman L. Paul as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dorothy K. Stearns, Ph.D. as Research Fellow in Biochemistry, assigned to Medicine, for one year, beginning January 23;

Dr. Muallâ Süler as Clinical Fellow in Psychiatry, for a period of six months, beginning February 1.

VOLUNTEER GROUPS

MGH Staff Wives Association

When one of our better-informed Staff doctors made the inquiry recently, "Just what does the Staff Wives Association do?", it was decided that perhaps this was a question present in many minds here at the Hospital. It is to answer this query, as well as to stimulate more interest in this Hospital group, that the following description is submitted.

The Staff Wives Association was founded in 1950 for the purpose of providing service to the Massachusetts General Hospital, and hospitality to our professional visitors from other lands. For some time, several wives and many secretaries had felt the increasing burden of trying to assist the growing number of visitors who came to the Hospital to observe or to study over an extended period of time. Their problems were infinite, and the inauguration of a central bureau to which these situations could be referred for solution was one of the first projects undertaken by the Staff Wives Association.

As a result, we have the Reception Center for Professional Visitors, now in its third year, strategically located in the Moseley Corridor next to the General Store. Staffed weekdays from 10 A.M. to 4 P.M. by the wives of members of the Staff, this center is the spot to which all professional visitors to the Hospital are sent immediately to register. In this way, the Reception Center may keep an accurate file of Hospital and home addresses, as well as other pertinent information concerning all visitors to the Hospital — material not available anywhere else. Such visitors include doctors, nurses, technicians, social service workers, or any other professionally trained person who is pursuing a medical problem.

At the Reception Center we dispense to casual visitors information concerning Hospital programs and clinics, and give directions as to how to reach all areas within the Hospital. For those coming for longer stays, we stand ready to give assistance in locating rooms or apartments, schools for their children, or information on transportation — to name but three of the multitude of services sought by these people. Each year the Reception Center registers about 150 visitors to the Hospital. Of these, roughly 50 bring their families, any one of which may consist of as large a group as a wife, 6 children, and a tutor!

The service most frequently requested is for assistance in finding living quarters, and each year about 200 such problems are handled by the Reception Center volunteers. Our excellent housing files were started by Mrs. Grant V. Rodkey, and are now carefully kept up to date by Mrs. Benjamin Castleman and Mrs. Richard G. Whiting. These references save our Hospital visitors an incalculable number of hours of worry, and obviate unnecessary tramping along unfamiliar streets.

Probably the service that is least expected, and therefore receives the loudest praise from our visitors, is the Furniture Exchange which was started in the spring of 1953 by Mrs. Richard H. Sweet. Since furnished apartments are usually far beyond the means of these guests, the enterprising Staff Wives scoured their attics for "extras" and, greatly assisted by donations from the Hospital Maintenance Department, collected a variety of household furnishings and utensils which are now displayed in a basement area of the McLean Hospital. Under the guidance of Mrs. Paul M. Howard and Mrs. Vincent P. Perlo, our guests may select and use these furnishings during their stay in the Boston area. Last year our "borrowers" availed themselves of this service by taking over 300 pieces, varying in amounts from a single table to the furnishings for a 6-room apartment. The gratitude with which this service is welcomed is beyond comprehension.

In an attempt to mitigate the problems which confront our foreign professional visitors, the Staff Wives Association has just prepared a brochure to be mailed to these students before they leave their native lands. It explains the cost of living and housing conditions in Boston, the climatic variations, the visa requirements for those who must work, and the many services offered by the Reception Center. We strongly urge that our own Staff members send us the names and addresses of all visitors expected by their departments, so that this informative material may be sent to the visitors before their departure for America. Also, please be very sure they come immediately to the Reception Center to register when they arrive.

The Reception Center also fulfills a very important role in overseeing the social entertainment of these visitors from other countries. The Boston and suburban areas are divided into 12 communities, each under a chairman. In the hands of each of these chairmen are the names and addresses of the Staff Wives and of the foreign professional visitors residing in her area. She acts as the agent to encourage social exchanges between the two groups. In addition to these informal meetings, a special effort is made at Thanksgiving and Christmas, when all foreign visitors are invited into our American homes to enjoy our holiday festivities. Then, the annual spring picnic on the spacious grounds at the home of Dr. and Mrs. Bradford Cannon, sponsored by the Staff Wives who reside in Lincoln, provides a delightfully different type of party for the house staff, the foreign visitors, and their families. In addition, to encourage further friendships within the Hospital, three afternoon teas and one morning coffee party are held each year. To these are invited the various staff members and their wives, the foreign visitors, and key Hospital personnel. In these ways a sincere effort is made by the Staff Wives to add that bit of warmth and friendship that will make the visit of our foreign guests to Boston and to the Massachusetts General Hospital a treasured memory.

To the best of our knowledge, this Reception Center was the first of its kind to be established in a teaching hospital, and it has been most gratifying to the Staff Wives to receive complimentary inquiries about our procedures from other institutions. In 1956, Mrs. Oliver Cope (then our president) was invited by both the Massachusetts Hospital Association and the National Hospital Association to describe our Reception Center.

To turn to another service rendered by the Staff Wives Association, we point with pride to the Chapel concerts for the patients, under the able guidance of Mrs. Milford D. Schulz and Mrs. John D. Crawford. This project is now in its sixth season. Last year 14 concerts were given, with an average attendance of 60 persons. When one considers the planning and physical energy involved in getting an audience of that size from the Hospital ward in wheel chairs (or occasionally beds) down to the Chapel at an appointed hour, and then back to the floors for the next medications, one appreciates the efforts of the dedicated women who render this service. To this must be added the generosity of the distinguished musicians — some from the Hospital family and others from the excellent music schools of the Boston area — who give freely of their time so that these long-term patients may be refreshed by an hour of fine music in our beautiful Chapel. In March, through the generosity of an anonymous donor, the Staff Wives were able to purchase a baby grand piano to replace the well-worn upright in the Chapel, so that we now have an instrument worthy of the talented artists who perform upon it.

The Staff Wives Association serves the Hospital in many other ways. Members assist in the planning and execution of the Christmas parties on the Children's Wards, as well as the larger, more publicized ones for the members of the Hospital family. On occasions — such as Hospital Day, Ether Day, or the dedication of a new building — Staff Wives serve on hospitality committees. Yet another group assists the Children's Psychiatry Department in its recreation therapy, and still others supplement the enthusiasm of the Distaff Club in planning the Spring Dance.

To list the multitude of small Hospital services in which the Staff Wives are lending a hand would only bore our readers. But we *do* hope this brief account conveys an idea of the enthusiasm shared by us all in assisting the Massachusetts General Hospital to provide better service to the many patients and students of medical subjects who enter its doors.

Phyllis P. Welch,
Chairman of Publicity

DISTAFF CLUB

There have been two changes in our area representatives. Mrs. Robert E. Key replaces Mrs. John P. Connelly as the Watertown representative, and Mrs. Jack J. Greenberg succeeds Mrs. Sumner I. Zacks as representative coordinator.

On April 10, Dr. T. Berry Brazelton will speak to the Club on topics related to infant and preschool development, and will also answer questions from the audience. We are fortunate to have such an outstanding pediatrician speak to our group. Dr. Brazelton is Associate Physician on the Children's Medical Service at M.G.H., and is on the staff at the Children's Medical Center.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Cardiology

Lev, M., Benjamin, J. E., and White, P. D.
A histopathologic study of the conduction system in a case of complete heart block of 42 years' duration.
Am. Heart J. 55:198-214.

Sprague, H. B. (Editorial)
Emotional stress and the etiology of coronary artery disease.
Circulation 17:1-4.

White, P. D., Bland, E. F., and Levine, S. A.
Further observations concerning the prognosis of myocardial infarction due to coronary thrombosis.
Ann. Int. Med. 48:38-49.

Dermatology

Lever, W. F., and Klein, E.
The inhibition of lipemia-clearing by hyperlipemic serum.
J. Invest. Dermat. 29:465-469, 1957. [A check with medical libraries revealed that this journal was not received until the last of February 1958, therefore it is included. — *Editor*]

Endocrinology

Moldawer, M. P., Albright, F., Benedict, P. H., Forbes, A. P., and Henneman, P. H.

MASSACHUSETTS EYE & EAR INFIRMARY

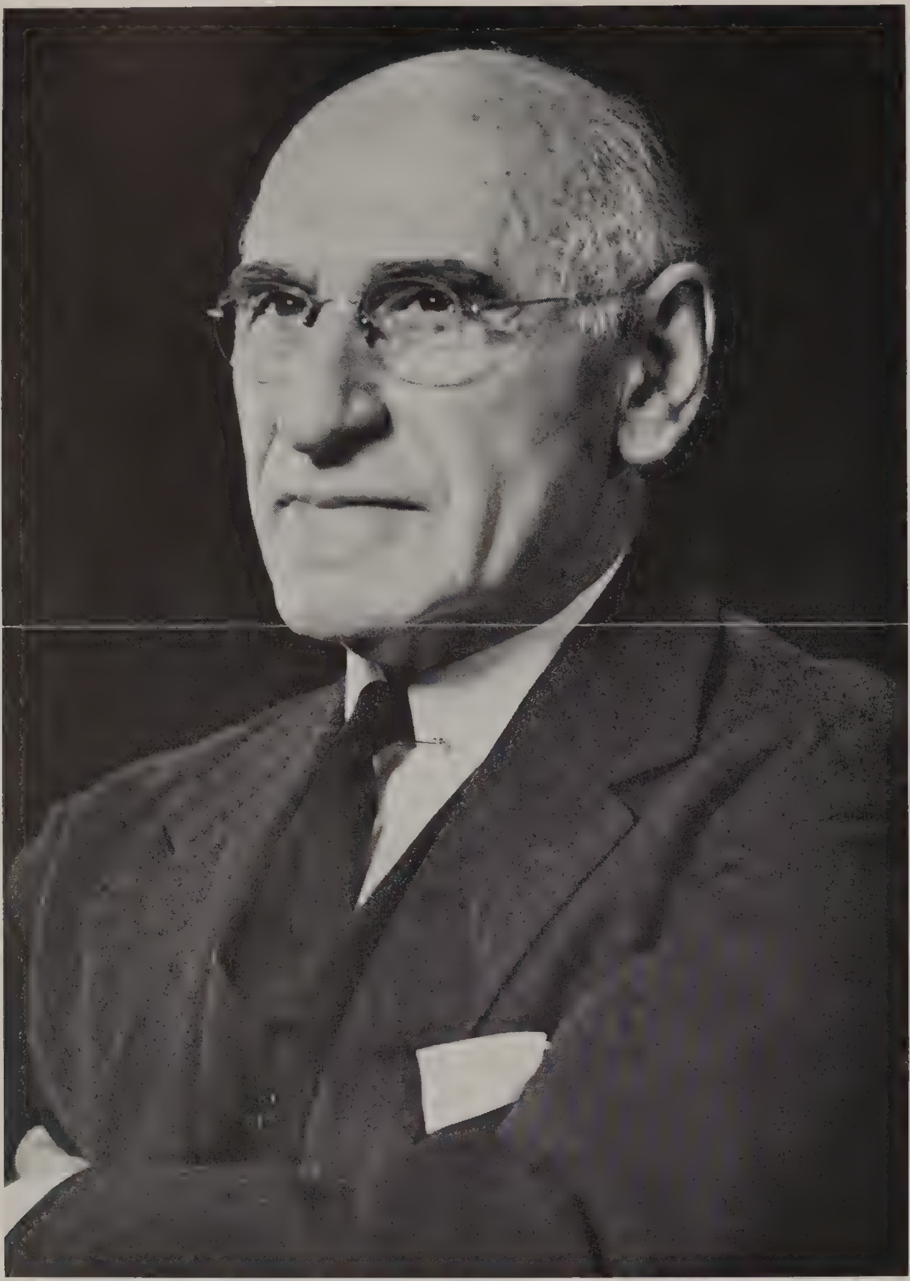
The 442d meeting of the New England Ophthalmological Society was held on March 19, at the Infirmary. The morning Operating Clinic was followed by a demonstration hour by members of the Infirmary staff. Among the afternoon speakers from the Infirmary staff were Drs. Pei-Fei Lee and Brendan D. Leahey, and Charles Snyder, Librarian, Howe Library of Ophthalmology.

Dr. Moses H. Lurie has been appointed President of the American Otological Society — the oldest society of its kind in this country — for the 1959 session.

Dr. LeRoy A. Schall, Chief of Otolaryngology, gave the principal address at dedication ceremonies of the Orton Speech and Hearing Center, Presbyterian Hospital, Newark, New Jersey. The Center was dedicated in memory of Dr. Henry B. Orton.

New addresses:—

Dr. Charles C. Dennie (*D.* 1914), 1524 Professional Bldg., Kansas City 6, Mo.



No. 74 in a series of Staff photographs

Dr. Carl A. L. Binger, member of the Board of Consultation

Dr. John R. McDaniel (*E.S.* 1940), 9th & Edmond Sts., St. Joseph, Mo.

Dr. Ruth E. Stauffer (r.p. *N.* 1949), Massachusetts General Hospital, Boston 14, Mass.

Dr. Ralph W. Walton (*W.S.* 1926), 101 Gates Ave., Montclair, N. J. (after May 1).

Brief bits:—

Dr. Bradford Cannon has been elected to membership in the American Paraplegia Society. He took part in the Hand Symposium held at the Boston City Hospital on January 30, in connection with the Annual Meeting of the Society for Surgery of the Hand. On February 26, Dr. Cannon spoke before the Berkshire County Medical Society in Pittsfield. His address, titled "Pacific adventure", was enthusiastically received by the audience.

Dr. Reed Harwood announces the opening of his office for the practice of Internal Medicine, in Suite 1109, Warren Building, Massachusetts General Hospital, 275 Charles St., Boston 14, Mass. It was in early March of 1957 that Dr. and Mrs. Harwood became the victims of a very serious automobile accident, and it is indeed welcome news to Dr. Harwood's many devoted patients to know that he is now able to resume his practice.

On January 8, Dr. George L. Nardi presented a paper entitled "Studies of liver blood flow in man", at the Third International Symposium on Radioactive Isotopes in Clinical Medicine and Research, held in Bad Gastein, Austria. On January 13, he stopped in Manchester, England, and delivered a lecture on "Recent developments in pancreatic obstruction", at the Royal Infirmary. Upon his return to the United States, Dr. Nardi went to San Francisco, at the request of the University of California Medical Center, and spoke on "Pathophysiology of hiatus hernia: Complications and treatment", at their Postgraduate Program on the Pathophysiology of the Alimentary Canal. On February 12, he was host for the annual meeting of the Mid-Century Surgeons Club, and presented a paper on "Pancreatitis". On February 14, he spoke on "Some observations on hepatic flow in man", before the Society of University Surgeons.

On February 11-12, Dr. Carter R. Rowe spoke before the Tri-State Medical Assembly, at Memphis, Tennessee. His subjects were "The fracture, in children, adults, and the aged" and "Orthopedic pain".

♣ ♣ ♣

This letter has come from the Secretary to Dr. Fiorindo A. Simeone (*W.S.* 1936):

We are terribly sorry not to have explained Dr. Simeone's change of address, and we can well understand your confusion.

On January 1, 1958, City Hospital of Cleveland was transferred from city to county ownership. Although we do not as yet have a popular name for this hospital, we are using the official name of Cuyahoga County Hospital.

Dr. Simeone is still Director of Surgery here — in fact, all remains the same except the name of the hospital. To create the least amount of confusion, your Directory should probably list Dr. Simeone's address as Cuyahoga County Hospital (formerly City Hospital of Cleveland).

This letter has come from Dr. Harvey E. Billig, Jr. (*Or.* 1935):

Enclosed is a reprint of an article on "Extended relief of tic douloureaux by physical therapeutic measures", written by me and published in the *American Journal of Surgery* of January 1958. It may be of interest to your readers to know that the foundation for the work reported in this article was inculcated in my mind by Dr. Sumner M. Roberts, my Chief when I first arrived at the Massachusetts General Hospital in 1934, as indicated in paragraph 4, column 1, page 82. I remember well his kindness, patience, and meticulous approach. Together with all those who knew him, I regret his early demise.

This delightful letter has come from Dr. Monroe A. McIver (h.s. *E.S.* 1922), written from the Nemazee Hospital, Shiraz Medical Center, Shiraz, Iran:

I am afraid I have not kept my file at the M.G.H. up to date. For the past year and a half Mrs. McIver and I have not been living in Cooperstown. However, I am still the only MGH-er in my town — Shiraz, Iran!

Summer before last, after 26 years as surgeon-in-chief at the Mary Imogene Bassett Hospital in Cooperstown, and, since the affiliation of the two institutions, clinical professor of surgery at Columbia University P. & S., I reached the retiring age. I then accepted a position under the Iran Foundation as chief surgeon of the Nemazee Hospital and Shiraz Medical Center, and Mrs. McIver and I came here in August 1956.

This institution is staffed by Americans and Iranians. It is devoted to training young Iranian doctors, and also, broadly speaking, to such projects as contribute to the health of Iran. The Center is unique in Persia, both because of its character and because it was planned, and given to Shiraz, by an Iranian. Private efforts on behalf of the community are almost unknown in this country, so that Mr. Nemazee's far-sighted generosity is outstanding. The hospital itself is modern, both in construction and in equipment, and except for the American University Hospital in Beirut there is nothing to compare with it in the Middle East. There is a school of nursing for Iranian girls that is turning out graduates in increasing numbers who meet American standards and will soon relieve the principal obstacle to running the hospital at full capacity. My work involves, in addition to clinical duties, the teaching not only of our house staff, which is perhaps my principal duty, but also of fourth year students at the Shiraz Medical School.

Shiraz is a delightful place in which to live. It is situated on the Iranian plateau, some 5,000 to 6,000 feet high, and is surrounded by mountains which, as I write, have snow on their tops, although our garden flowers bloom throughout the year. For those who have archeological interests — and who has not! — Persepolis and its surrounding antiquities are only 30 miles away. The Iran Foundation (Empire State Building, New York) is constantly looking for suitable men for most of the clinical and laboratory departments. Perchance some of the MGH graduates might be interested in working in this part of the world.

My 2-year term in Shiraz is up in May and we are returning to Cooperstown, where I shall continue my interest in the Bassett Hospital as trustee and surgeon-in-chief *emeritus*.

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 177 Boston, Mass May 1958

THE HOWE LABORATORY OF OPHTHALMOLOGY

Thirty years ago, on October 1, 1927, the Howe Laboratory of Ophthalmology began to function actively as a research unit, in a single room provided by the Harvard Medical School. The staff consisted of Lucien Howe, M.D., the director; Clyde E. Keeler, Sc.D., research fellow; Harry Messenger, clinical investigator; and 2 laboratory assistants and 1 stenographer.

Today, April 1958, the Howe Laboratory occupies an entire floor of the Research Center of the Massachusetts Eye and Ear Infirmary. This area, with 4,500 square feet of floor space, is divided into 18 rooms that are utilized as laboratories, examining rooms, offices, machine shops, animal room, and storage space. Including the director, Dr. David G. Cogan, the staff consists of 6 full-time investigators. These investigators are aided by 6 laboratory and technical assistants, 3 secretaries, and 1 machinist. From time to time the Laboratory staff is augmented by investigators holding temporary appointments. During 1957 there were 9 such investigators.

In contrast with the world of today, the world of 1927 was a calm, peaceful, and unhurried place. Lucien Howe, then in his 80's, could look back over a useful career of more than 50 years devoted to private research and to the clinical practice of ophthalmology. It was, of course, impossible for him to look forward and envisage any of the great changes that would place extraordinary demands on the ophthalmic research laboratory he had endowed and established.

Nowhere is this more evident than in the notes he kept for the first few months of the Laboratory's life. Never dreaming there would be a profound change in the value of the U.S. currency, he wrote that the salary of a junior investigator should be $1800 a year and that a technical assistant should be paid $25 a week. He felt that senior investigators should receive $4000 a year. This, he said, was the salary most university professors of the time received.

Because the Laboratory was a neophyte organization, he limited the research activities to two fundamental lines of research: (1) hereditary blindness, and (2) physiological optics. He decided that the problems which were most pressing — such as those of cataracts, glaucoma, and one or two other diseases — should be left to others to deal with. In making this decision, Dr. Howe must have been influenced in part by his own experiences as a research worker. For many years he had been actively concerned with the two investigative problems he laid before his staff.

Dr. Howe had served as director for a little over a year when death came to him. However, his term of service, while brief, left its mark on the Laboratory. As a result of his interests, 35 papers on the subject of genetics and heredity in ophthalmology were published in the next few years by staff members; and physiological optics is a problem which has been dealt with continuously in the Laboratory since Dr. Howe's time.

But Dr. Howe's principal concern was with the fact that progress in medicine was painfully slow when the sole source of information was clinical experience. He knew from his own experiences as a private research worker that for research to succeed it should be done in a permanent laboratory, staffed with full-time investigators. He also knew that for a research enterprise to have an assured life it should be attached to a larger and permanent institution. This was his basic philosophy, but he could not put it into effect because he was hampered by lack of adequate space, the task of assembling a staff, and his own age and general professional background.

In 1931 Dr. Frederick H. Verhoeff was named director of the Howe Laboratory. The impact of a personality broader in experience, younger, and more vigorous was immediately apparent. No one in Boston was more admirably suited to head the Laboratory than Dr. Verhoeff. He had served as pathologist at the Infirmary for 30 years and had directed that small laboratory. He was uniquely equipped, in that he had an excellent grasp of ophthalmic surgical and clinical problems as well as the mind and interests of a researcher. He could write a paper on binocular vision, direct an investigation on experiments in the treatment of herpes zoster, and then devise a new surgical instrument.

The idea of full-time career investigators in ophthalmic research was a new one. It had to be "sold". As a salesman, Verhoeff was first rate. He was able to arouse first the interest, then the enthusiasm, of at least half a dozen young men. These he took into the Howe Laboratory — some as full-time investigators, some as part-time investigators and assistants. There he provided them with problems which would last them a lifetime.

Dr. Verhoeff reached the compulsory retirement age in December of 1940. At his urging, the then 33-year-old Dr. David G. Cogan was named acting director and then director of the Howe Laboratory. The ink on Dr. Cogan's appointment letter was hardly dry when the United States was enmeshed in World War II. Plans and programs — many of which had been in the process of development for several years — had to be abandoned in favor of projects that were vital to the welfare and defense of the nation.

One of the great fears of the time — one that never materialized — was that toxic war gases might be used in battle. To prepare for this, the Howe Laboratory, along with other laboratories, was assigned the task of studying the effects of such gases — particularly mustard and lewisite — on the eye. The Howe Laboratory was selected because the staff had been working on the physiology of the cornea for several years. Later, this work was to win for them the coveted Warren Triennial Prize.

Another wartime problem given to the personnel of the Howe Laboratory was the devising of visual aids for pilots, to be used in training and combat. The final blow of the war (the atomic bomb blasts at Japan) brought out another ophthalmic problem — the atomic bomb cataracts. The investigation of this problem became a task for the Howe Laboratory.

The three directors of the Howe Laboratory — Dr. Howe, Dr. Verhoeff, and Dr. Cogan — have all recognized that the Howe Laboratory has two prime functions, equally important. The first function, of course, is research into the problems of ophthalmology; the second is the training of career investigators. The first graduating class, if that term may be used, consisted of Elek Ludvigh and V. Everett Kinsey. These two investigators had been brought into the Laboratory by Drs. Verhoeff and Cogan. Dr. Ludvigh's interests were in the field of physiological optics, and Dr. Kinsey's were in ophthalmic biochemistry. By 1950 these two men had reached mature stature in the ophthalmic community. Their work — much of it of a pioneer nature — had been incorporated in the new theories concerning the physiology and biochemistry of the eye. When the Kresge Eye Institute of Detroit was founded, these two men were invited to become members of the staff — Dr. Ludvigh as Director of Research and Dr. Kinsey as Assistant Director of Research. There is no question but that the careers of these two men were molded by the years of experience and opportunity they had enjoyed in the Howe Laboratory.

After a time, a second (the present) group of career investigators took their places in the Laboratory. These men were W. Morton Grant, M.D., David D. Donaldson, M.D., Jin H. Kinoshita, Ph.D., Toichiro Kuwabara, M.D., and Harold L. Kern, Sc.D.

The Howe Laboratory has never been large enough or wealthy enough to accommodate a large group of investigators. Because of this, it has been deemed wise to limit the permanent staff to a small number of investigators and to invite as many temporary investigators into the Laboratory as possible, to work with the permanent staff members for short periods of time. Like so many experiments in medical education, it will be a long time before the value of this experiment can be truly assayed.

For more than a generation it has been recognized that men who are contemplating entering ophthalmology should have, in addition to their residencies, training in the basic sciences of ophthalmology. There was much said but little done about this problem until 1938, when the Howe Laboratory staff, in conjunction with the Harvard Medical School's Department of Ophthalmology, established a postgraduate course in the ophthalmic sciences. The program was an immediate success. Despite an interruption caused by the war, the course has continued to be popular. Each year a group of 20 to 25 young men, all planning to enter ophthalmology, enroll. Personnel of the Howe Laboratory continue to be active members of the teaching staff. The course is now directed by Dr. Henry F. Allen — himself a product of the Laboratory's training program.

To return to the research function of the Laboratory—in 1927 Dr. Howe specifically excluded two investigative problems that are now leading projects in the Howe Laboratory. These problems are the age-old ones of glaucoma and cataract. They are now being studied by methods and devices that were unheard of 30 years ago.

One of these new methods is tonography — a method for the clinical measurement of aqueous outflow that was introduced by Dr. Grant in 1950. The instruments used are an electronic tonometer amplifier and a recording galvanometer. Briefly, the procedure may be described as one in which the drop in ocular tension is observed continuously while an electronic Schiötz tonometer is applied continuously to the anesthetized cornea for a period of 4 to 6 minutes. The recording galvanometer records the findings graphically. It has been shown by this method that simple glaucoma is associated with increased resistance to outflow of aqueous from the eye and that this subnormal facility of aqueous outflow may continue to be subnormal even at those times when the intraocular pressure itself is normal. Further studies, using tonography, have led to the thought that the site of resistance to outflow is unrelated, at least basically, to the general circulatory or nervous system.

In evaluating glaucoma therapy, tonography is useful in determining the adequacy of treatment — be that treatment surgery, the use of miotics, or the use of systemic carbonic anhydrase inhibitors such as Diamox.

When the value of tonography as a diagnostic aid had been proved and accepted, it was decided to transfer the routine work of tonography to the newly established Glaucoma Consultation Service in the Infirmary's Out-Patient Department. Dr. Robert R. Trotter, who had served as research assistant to Dr. Grant for several years, was appointed chief of this new service.

This release from routine diagnostic work gave the Howe Laboratory staff the time and facilities necessary to pursue studies on the physiology and histology of the trabecular meshwork — that anatomical area of the angle of the anterior portion of the eye that is known to be in part responsible for aqueous outflow.

Another technique that was unknown to the men of Dr. Lucien Howe's generation is the use of radioactive isotopes — a direct product of the atomic age. In the Howe Laboratory these valuable substances have been used to study the metabolic pathways of the crystalline lens. These studies have revealed that the metabolism of glucose in the lens proceeds mainly by means of the glycolytic mechanism. However, the aerobic phase is different from that of other tissues. The production of carbon dioxide is largely effected through the direct oxidation pathways, with little participation by the citric acid cycle. These findings naturally lead to the thought that cataract formation may be linked to this peculiarity of metabolism.

In 1951 the Howe Laboratory staff became interested in the pathological condition known as arcus senilis. Arcus senilis is a fatty degeneration of the cornea met with in old people. Investigation of the condition led to the experimental production of fat by cells of the cornea. The ease with which this experimental fat formation could be elicited and controlled in the cornea led to broader studies on experimental fat formation in other cells of the body. These studies give promise of having particular significance in the fields of atheroma formation and fatty degeneration. The name "aberrant lipogenesis" has been given to this phenomenon, which has been found to be an intracellular, enzymatic process of many (but not all) cells of the body. It occurs only in the presence of serum and an oleate-containing substrate. It can be induced *in vitro*.

Mention has been made here of only three recent investigative endeavors of the Howe Laboratory staff: those concerned with tonography, lens metabolism, and aberrant lipogenesis. There have been and are many more.

One unit of the Laboratory has for a number of years been assembling a collection of stereophotographs of the eye in health and disease. This began in the Laboratory with Dr. Donaldson's designing of a special stereocamera capable of taking these unique pictures.

Another unit of the Laboratory has been concerned with finding effective means for treating chemical injuries of the cornea; with the testing of the efficacy of new and experimental drugs; and with defining the toxicity to the eye of various industrial chemicals and rare earths.

There have been recent studies on the physiology and histology of the crystalline lens, the cornea, and the retina; on the neurology of the ocular muscles; on microwave cataracts and radiation cataracts; and on specific entities such as retinitis pigmentosa, third nerve palsies, cystinosis, herpetic iritis, uveitis, and periarteritis nodosa.

And, as if to swing back to Dr. Howe's interests of 30 years ago, genetic studies have recently been done on the eyes of twins, on the eyes of mentally retarded children, on heredo-familial degenerations of the cornea and the retina, and on the inheritability of retinoblastoma.

This, then, is a summary of 30 years of research and training endeavor in the Howe Laboratory of Ophthalmology. Like so many other scientific research laboratories, this Laboratory has been primarily a place of opportunity — opportunity to work, to study, and, whenever possible, to add to the sum total of scientific knowledge. The results of the work and study done in the Howe Laboratory have never resulted in violent overthrowing of existing opinions. Instead, there has been a steady flow of well-authenticated facts that have quietly been incorporated in today's ophthalmology. It is in this fashion that the staff has lived up to the hopes of the Laboratory's founder—Dr. Lucien Howe.

Charles Snyder,
Librarian, Howe Library

* * *

ARTHUR W. ALLEN

Dr. Arthur W. Allen died on March 18, 1958. Despite a long illness, he had maintained his professional activities until a few weeks before his death.

He was born on November 30, 1887, in McKinney, Kentucky. He graduated from Georgetown College, and then from Johns Hopkins Medical School in 1913. Immediately afterward he became a house pupil in the Massachusetts General Hospital, where he rose progressively through the ranks until at the time of his death he was a trustee of the Hospital.

The greatest interest in his life, besides his small and devoted family, was the Massachusetts General Hospital. His most important contributions were made during the years 1936 to 1948, when he was the last Chief of the East Surgical Service. On his retirement, the amalgamation of East and West Services marked the end of an era. Successive generations of house officers, residents, and assistants will never forget his strict attention to detail, his abhorrence of any technique that was less than perfect, his all-seeing eyes, and his ability to penetrate directly to the heart of a question as he discarded all irrelevant data in the hot pursuit of a solution. His surgical intuition was extraordinary, because it was based on experience. All house officers will recall forecasts of calamities which would follow certain procedures; if he predicted they were to appear forty days later, they did so.

In his professional life he preserved an intensely personal relationship with his patients in a way that now is almost forgotten. At times patients who were doing well might catch pneumonia, they said, from the wind stirred up as he whistled in and out of the room; but when time permitted, literally hours would be spent in cheering the sick. Certainly, concern with the care of the patient as the primary duty of the doctor was vital to him. In this he recognized the great contributions of the nursing staff. They were his co-workers; he supported them; they loved and admired him.

In 1940 it was discovered that he had malignant lymphoma. From that time on until his death he was forced to interrupt periods of intensive professional activity for recuperation and treatment. Notwithstanding, he carried out his greatest contributions to surgery under the shadow of death that was believed to be imminent during most of the last 18 years of his life.

Of the members of the Massachusetts General Hospital community, many will remember him because of his original surgical techniques in the fields of gastric surgery, peripheral vascular disease, and common duct reconstruction. Not many realize that his contributions to many other societies have been as remarkable as those to the Massachusetts General Hospital.

He was an extremely active member of many surgical organizations and played a very important role in the elevation of the standards of surgery throughout the past 40 years. He was President of the American College of Surgeons in 1947-1948, and Chairman of the Board of Regents from 1948 to 1951. He was President of the Boston Surgical Society in 1942, of the Massachusetts Medical Society in 1949, of the Society of Vascular Surgery in 1948, and of the Pan-Pacific Surgical Society from 1954 to 1957. In addition, he was Chairman of the Surgical Section of the American Medical Association in 1942, and of the United States Committee of the International Society of Surgery in 1950. He also was a member of the American Surgical Association, the Southern Surgical Association, the New England Surgical Society, the Society of Clinical Surgery, the Surgical Research Society, and the Eastern Surgical Society.

He had received many honors both at home and abroad. The honorary degree of Doctor of Science was given to him by Georgetown College in 1943, and by Harvard in 1952. He was awarded the Bigelow Medal by the Boston Surgical Society in 1956—an honor bestowed on only 14 surgeons in the past 40 years. He was a member of the American Academy of Arts and Sciences, of the French Academy of Surgery, and an honorary member of the Royal College of Surgeons of England and of Edinburgh.

In his later years he became deeply interested in the Boston Medical Library. Largely due to his efforts, and to those of an active Committee that he appointed, the library was revitalized as one of the most important in the country.

Because of his intense interest in the Massachusetts General Hospital, a memorial fund has been established in his memory to be designated for a project in the forthcoming Hospital expansion program. In this way his spirit will continue to mold the Massachusetts General Hospital of the future. He would have asked for no finer reward.

C. E. W.

[Claude E. Welch, M.D.]

WILLIAM JASON MIXTER

1880-1958

The main currents of Jason Mixter's life ran deep and strong until the end. His was a life of fine continuity of purpose and devotion to all that he held most dear. The four major ingredients of the good life were his—deep satisfaction in professional work, love of family and friends, rich and rewarding religious life, and joy in play.

Entering Massachusetts Institute of Technology with its class of 1902, he worked hard as an undergraduate (everyone works hard at M.I.T.), and then did likewise at the Harvard Medical School from which he graduated in 1906. This was followed, of course, by an internship at the Massachusetts General Hospital (*South Surgical,* 1907). Thus, in the footsteps of his surgeon father, Samuel Jason Mixter, was William Jason Mixter launched on his long and distinguished career in surgery. He started at once in private practice, along with his brother Charles Galloupe Mixter, and under the leadership of his father, who was affectionately known as "The Chief". Although for some years Jason Mixter did much general surgery, very early he developed his attachment to neurosurgery, in which later he was to ascend the heights. It is interesting that when the Surgical Executive Committee was formed at the M.G.H. in 1911, one of its early actions was to give a special assignment in the surgery of the central nervous system to Drs. S. J. and W. J. Mixter. In neurosurgery, Dr. Jason took over, so to speak, where his father left off. He started at once vigorously to develop and perfect himself in this field. Early attention was given to improving the treatment of patients with fractured skulls. Another early interest was that of tumors of the spine and cord. The technique of laminectomy was improved. Close collaboration with the Neurological Service proved to be a fertile liaison. Especially Dr. Mixter worked with Dr. James B. Ayer, the inventor of cistern puncture, in the localization of lesions involving the spinal cord.

The first World War interrupted all this for several years. Even before the United States entered this war, Jason Mixter had taken off to do his bit for the allied cause. In February of 1915 he went to France to serve on a civilian basis as a surgeon to the American Ambulance Hospital B (the Harry Payne Whitney Hospital) at Juilly, thirty miles east of Paris. Here he remained for about three months, during which time he had an intensive experience in military surgery. Battle casualties came in directly from advanced stations. After Juilly, Dr. Mixter was moved still nearer the front, to Château Annel, where a hospital was being run by the British Red Cross, in which he found still more serious cases to treat. He returned to the United States in June 1915.

Dr. Mixter went overseas again in the early summer of 1917, this time on a military basis, as a surgeon to the MGH Army Unit, Base Hospital #6, which became stationed at Talence near Bordeaux. Here he had some general surgery and some neurosurgery to do, but also a certain number (perhaps more than his share) of military chores, all of which he accomplished with characteristic devotion and effectiveness.

In the spring of 1918, at the request of Colonel F. A. Washburn, he was transferred to England, through which many American troops were passing. There, until his return to the United States early in 1919, he demonstrated that he had competence in the field of military medical administrative problems. At first he served as Commander of Camp Hospital #35 at Winchester and later as District Surgeon of the Winchester district, an area containing several American hospital installations. His final assignment in England was that of Commanding Officer of Base Hospital #204 at Hursley Park near Winchester. During his command there, this hospital, like many others, became engulfed by the dreadful influenza epidemic in the autumn of 1918, the like of which has not been seen since; but under Mixter's leadership, our sick and dying troops received the best care existing knowledge permitted.

Back at the M.G.H. and private practice when the war was over, Mixter got into the full stride of his work in neurosurgery, which was maintained throughout his active service at the Hospital and for some years in private practice thereafter. In 1933, having already attained the rank of Visiting Surgeon, he was likewise given the title of Chief of Neurosurgery. Finally, in 1939 a special service of Neurosurgery was created and he was made its Chief.

Increasingly close relations developed with the Neurology and Ophthalmology Services, and a bit later with the Orthopedic Service as well. The last was in the matter of lesions of the intervertebral discs. Of brain and of cranial and peripheral nerve surgery Mixter did a plenty, but perhaps his most outstanding work was on the spinal cord. Interest in intervertebral discs at the M.G.H. and elsewhere goes back at least as far as the twenties, but it was probably the paper of Mixter and Barr in 1934 that brought the matter into the limelight and led to the general use of a surgical procedure which cured or relieved great numbers of sufferers from low-back pain and sciatica.

Mixter continued as Chief of Neurosurgery until he reached the Hospital's retiring age for part-time members of the staff in 1941. He was succeeded by Dr. James C. White. World War II, however, presently began and Dr. White went off on Naval duty, so Mixter was called back to his old job and served as Acting Chief from 1941 to 1946.

During this war, also, Mixter served as Senior Consultant in Neurosurgery to the Surgeon General of the Army, in which capacity he spent much time in Washington and in visiting neurological centers in many parts of the country.

In 1911 Jason Mixter married Dorothy Fay, who survives him, as do also three brothers, four children, and twelve grandchildren. The long and happy marriage of the Jason Mixters gave rise to a closely knit and stable family life of a sort becoming all too infrequent in present-day American society. Indeed from "Chief Mixter" on, the Mixter family in the large approached the pattern of a Scottish clan. The Mixter farm at Hardwick, Massachusetts, is the country estate where the clan has gathered on frequent happy occasions, and clan life also blossomed in the years when "Chief Mixter" was alive at Galloupe's Point, Swampscott, Massachusetts, the family summer place of Jason's mother, Wilhelmina Galloupe Mixter. Here royal hospitality, expressed sometimes in the form of magnificent clambakes, was offered without stint to innumerable friends. There was similar cohesiveness in the Fay family, which had impressive land holdings in Woods Hole and Falmouth, Massachusetts, particularly the grand old summer establishment at Nobska Point. Jason and Dorothy Mixter spent much of their vacation time there, and after living for many years in Brookline, at Jason's retirement from active practice they built in 1953 their own charming house at Nobska and made it their year-round home.

Jason Mixter's religious life has been so eloquently and beautifully defined by the Reverend Theodore P. Ferris that it need only be said here that he served on the vestry of Trinity Church, Boston, the incredibly long period of nearly forty years, from 1919 until his death. Also from 1949 until his death he was Senior Warden. It was a very happy circumstance that when the new Neurosurgical Laboratories in the Warren Building, named for Jason, were dedicated on October 16, 1957, he was there to hear Dr. Ferris's wonderful tribute.

Finally, coming to his play, we find it also, though secondary, was an important feature in the whole life picture of Jason Mixter. Together with his father, his brothers, and his children, he was always an ardent sportsman. Fish, ducks, quail, and partridge were his favorite quarry, and Grand Lake Stream, Maine, a favorite hunting ground.

There were many other facets to this well-ordered life of which space does not permit mention. His many professional societies, committees, and all that sort of thing cannot even be enumerated. It should be recorded here, however, that he was appointed a trustee of the Massachusetts General Hospital in 1946 by Governor Robert F. Bradford, and in that capacity served until 1954. Also in the forties he was a term member of the Corporation of Massachusetts Institute of Technology, and for some years was also a member of the Institute's Advisory Committee on the Medical Department. At the time of his death he was an Honorary Surgeon to the Massachusetts General.

The emotion uppermost in the hearts of his multitude of friends at this time of his departing is most likely that of thankfulness for having known him. He died full of years, of both happiness and devoted service. For this life we can all be very grateful.

J. H. M.

[J. Howard Means, M.D.]

An Edward Peirson Richardson Lecture was delivered at the Hospital on April 2 by Dr. Jethro Gough, Professor of Pathology at the Welsh National School of Medicine, Cardiff, Wales. His subject was "The pathology of emphysema".

The Board of Trustees, at their meetings on February 21, March 7 and 21, and April 4, voted:

To accept with regret the resignation of Dr. Milton H. Clifford from the position of Associate Physician, effective as of February 28;

To rescind the Trustees' vote of December 27, 1957, appointing Dr. John A. Warden as Assistant in Radiology, beginning July 1;

That the Dental Service be granted an additional Intern, making a total of three;

That Dr. Jethro Gough, Professor of Pathology at Welsh National School of Medicine, Cardiff, Wales, be invited to give a Richardson Lecture early in April;

That Dr. John McMichael, Professor of Medicine, Postgraduate Medical School, London, be invited to give a Richardson Lecture some time during April or May;

That Dr. E. F. Scowen of Saint Bartholomew's Hospital, London, be invited to give a lecture at the Hospital during April.

To appoint:

Dr. Harrison C. Anderson as Intern in Pathology for one year, beginning July 1;

Dr. George H. Collins as Assistant Resident in Pathology, assigned to Neuropathology, for one year, beginning July 1;

Dr. Louis J. du Preez as Assistant Radiologist, beginning on or about May 15;

Dr. Donald J. Glotzer, who completed his assistant residency in Surgery on December 31, 1957, as Acting Assistant Resident in Pathology, beginning January 1, 1958;

Dr. William T. McCoy as Second Assistant Resident in Radiology, beginning July 1;

Dr. James L. Reynolds as an Exchange Assistant Resident on the Children's Medical Service, for the months of April and May;

Dr. Lewis Sherman as Associate Psychologist, part-time, at McLean Hospital;

Dr. John B. Stokes as Visiting Physician pro tempore, for a period of two weeks in May.

The Trustees voted to appoint the following Interns on the Medical Service for one year, beginning July 1:

Dr. Arthur K. Asbury
Dr. Caesar Briefer, Jr.
Dr. William T. Butler
Dr. Cecil H. Coggins
Dr. Myron A. Hofer, II
Dr. George A. Jacoby, Jr.
Dr. Myron Lotz
Dr. Robert H. Schapiro
Dr. Robert T. Schimke
Dr. Rodman D. Starke
Dr. William E. Strole, Jr.
Dr. Hibbard E. Williams

The Trustees also voted to appoint the following Interns in Surgery for one year, beginning July 1:

Dr. Stanley P. Bohrer
Dr. Mortimer J. Buckley, Jr.
Dr. Willard M. Daggett, Jr.
Dr. Lewis P. James, Jr.
Dr. John W. Madden
Dr. Anthony S. Patton
Dr. Don C. Pearl, Jr.
Dr. John T. Porvaznik, Jr.

At their meetings on February 26 and during March, the General Executive Committee voted:

To reappoint Mary D. Albert, Ph.D. as Research Fellow in Medicine, retroactive to November 1, 1957;

To extend the appointment of Dr. Pablo E. Fletcher as Clinical Fellow in Medicine, from March 1 through April 30.

To appoint:

Dr. Gaston Chamorro as Graduate Student Assistant in Medicine, assigned to Cardiology, for the period January 6 through May 31;

Dr. Ruth K. Freinkel as Clinical and Research Fellow in Dermatology, effective as of March 1;

Dr. Wayne M. Hebertson as Clinical and Research Fellow in Neuropathology for one year, beginning July 1;

Dr. Henry P. Pendergrass as Clinical Fellow in Radiology, for a period of six months, beginning April 1;

Dr. Flaviu C. A. Romanul as Fellow in Neuropathology for one year, beginning July 1;

Dr. Richard L. Rovit as Clinical Assistant in Neurosurgery, effective immediately, this appointment to run concurrently with his appointment as Resident in Neurosurgery;

Dr. Elihu M. Schimmel as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. Herbert Schunk as Clinical Fellow in Radiology, beginning July 1;

Dr. Robert G. Spiro as Research Fellow in Medicine for one year, beginning July 1;

Dr. Jack R. Starrett as Clinical Fellow in Radiology, beginning July 1;

Dr. John B. Tallon as Clinical Fellow in Orthopedic Surgery, for the period April 18 through June 30, with the privilege of assisting Dr. Aufranc in the care of his private patients. It was further voted that on July 1 Dr. Tallon be promoted to the position of Senior Resident in Orthopedic Surgery.

IMPORTANT NOTICE

ESPECIALLY FOR THOSE MEMBERS OF THE HOUSE STAFF WHO WILL BE LEAVING THE HOSPITAL ON JUNE 30

Since 1951, the Directory section of our *Annual Report* has been prepared in the Archives Department. We make every effort to keep addresses up to date and accurate, but there is no way for us to achieve this goal unless we are notified by each individual when there is a change in his address. We feel it is too risky to revise our records, in many instances, on the say-so of a third person, until we check directly with the person involved.

Such needless demands on our time would be obviated if each individual would notify us promptly of any change in his address.

An illustration of what we mean comes to mind. Not so long ago we published in THE NEWS a letter from one of our alumni in South Africa, in which he told us that another alumnus was practising medicine in the same locality. The most recent address we had for the alumnus mentioned in the letter had come to us two or three years previously, when he had given us a Boston address. And so his record had remained, incorrect, for quite some time.

This is only one of several such instances which have come to our attention. Therefore, whenever you change your present office address or open a new office, please notify Cora F. Holbrook, Archivist and Editor of THE NEWS. Otherwise, it will remain unchanged in the Directory section of the *Annual Report*. Each intern or resident *must* (a word we seldom use) leave with us his new temporary or permanent office address upon completion of his service at the Hospital.

Your cooperation in this very important matter will be greatly appreciated.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor unnecessary time and trouble when you omit it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Biological Chemistry

Klein, E., Lever, W. F., and Fekete, L. L.
Inhibitors of lipemia clearing in tissues.
J. Invest. Dermat. 30:41-42.

Dentistry

Trieger, N., Ship, I. I., Taylor, G. W., and Weisberger, D.
Cirrhosis and other predisposing factors in carcinoma of the tongue.
Cancer 11:357-362.

General Surgery

Churchill, E. D.
Wound surgery encounters a dilemma.
J. Thoracic Surg. 35:279-290.

Grillo, H. C., Watts, G. T., and Gross J.
The marginal localization of the contraction mechanism in open wounds.
In Surgical forum, Chicago, Ill., American College of Surgeons, vol. 8, pp. 586-589.

Raker, J. W.
Tumors of the adrenal glands.
Am. J. Surg. 95:353-358.

Scannell, J. G., and Grillo, H. C.
Primary tumors of the heart: A surgical problem.
J. Thoracic Surg. 35:23-36.

Neurology, Neurosurgery, and Psychiatry

Richardson, E. P., Jr.
Late-life epilepsy.
In M. Clin. North America, Philadelphia, W. B. Saunders Company, vol. 42, no. 2, pp. 349-359.

Robinson, C. V., and Selverstone, B.
Localization of brain tumors at operation with radioactive phosphorus: An improved technique using a proportional counter.
J. Neurosurg. 15:76-83.

Otolaryngology

Hirsch, O.
Pathology of the sphenoidal sinus.
A.M.A. Arch. Otolaryng. 67:85-92.

Physical Medicine

Watkins, A. L., and Liao, S. J.
Rehabilitation of persons with bilateral amputation of lower extremities.
J.A.M.A. 166:1584-1586.

Books

Morris, J. McL., and Scully, R. E.
Endocrine pathology of the ovary.
St. Louis, The C. V. Mosby Co.

Watkins, A. L.
A manual of electrotherapy.
Philadelphia, Lea & Febiger.

BOOKS RECENTLY ADDED TO TREADWELL LIBRARY

The library call number is given, within parentheses, for each item.

Dr. Henry C. Everett, III, Assistant Resident in Psychiatry — born in Boston, Massachusetts, February 14, 1928; B.S., Harvard College, 1950; military service: Pfc, 6th M.P. Division, Pusan, Korea (18 months' interruption during college); Research Assistant to Dr. William H. Sweet in the Department of Neurosurgery, Massachusetts General Hospital, 1950-51; Johns Hopkins School of Medicine, 1951-55; Intern, rotating, and Resident in Medicine, Rhode Island Hospital, Providence, Rhode Island, 1955-57.

Dr. David M. Klein, Assistant Resident in Neurosurgery — born in Washington, D. C., November 30, 1928; University of Maryland, 1946-49; George Washington University School of Medicine, Washington, D. C., 1949-53; Intern, rotating, Philadelphia General Hospital, 1953-54; military service: Captain, MC., USAF, Misawa AFB, Japan, 1954-56; Assistant Resident in General Surgery, Beth Israel Hospital, 1956-57; Clinical and Research Fellow in Neurosurgery, Massachusetts General Hospital, 1957.

Dr. Clinton B. Seeley, Assistant Resident in Radiology — born in New York City, August 28, 1927; U. S. Army: Sergeant, Honor Guard to General MacArthur, GHQ, AFPAC, Tokyo, 1945-47; B.S., Massachusetts Institute of Technology, 1951; M.D., University of Rochester, Rochester, N.Y. , 1955; Intern, rotating, Strong Memorial Hospital, Rochester, N. Y., 1955-57; married; home: Stamford, Connecticut.

Dr. Barbara E. Waud, Assistant Resident in Anesthesia—born in Kitchener, Ontario, Canada, May 18, 1932; University of Western On-

DR. DAVID G. COGAN—DIRECTOR OF THE HOWE LABORATORY OF OPHTHALMOLOGY

tario, 1950-56; M.D., University of Western Ontario, 1956; married; home: London, Ontario, Canada.

Dr. Sanford D. Weinert, Assistant Resident in Urology—born in Providence, Rhode Island, December 13, 1925; Boston Latin School, 1943; military service: Holy Cross College Navy V-12, 1943-44 and Ensign, Pacific and Atlantic Fleets, 1943-46; B.S., Boston College, 1948; A.M., Harvard College, 1950; M.D., Chicago Medical School, 1954; Intern, District of Columbia General Hospital, 1954-55; Junior Assistant Resident in Surgery and Assistant Resident in Urology, Boston Veterans Administration Hospital, 1955-57; married; one daughter; home: Newton, Massachusetts.

Dr. Peter M. Yurchak, Intern in Medicine, born in Wilkes-Barre, Pennsylvania, December 21, 1932; A.B., University of Pennsylvania, Philadelphia, 1953; Temple University School of Medicine, Philadelphia, 1953-55; M.D., Harvard Medical School, 1957.

Dr. Irving Zieper, Assistant Resident in Neurology—born in Worcester, Massachusetts, September 26, 1928; B.S. in Biology, Boston College, Chestnut Hill, Massachusetts, 1948; Teaching Fellow, University of Notre Dame, Notre Dame, Indiana, 1948-49; M.S. in Physiology, Yale University, 1952; M.D., University of Pennsylvania Medical School, 1956; Intern in Medicine, Grace-New Haven Community Hospital, 1956-57.

VOLUNTEER GROUPS

DISTAFF CLUB

The Commonwealth Country Club in Newton will be the setting for our fifth Annual Spring Formal Dance. This event, which is organized by the Distaff Club and sponsored also by the Massachusetts General Hospital Trustees and General Director, and the MGH Staff Wives Association, will take place on Friday evening, May 9. Harry Marshard and his orchestra will provide music for dancing from 9 until 1 o'clock.

The dance committee, headed by co-chairmen Mrs. Bruce J. Sams, Jr. and Mrs. John L. Lewis, Jr., is composed of members of both the Distaff Club and the Staff Wives Association.

Invitations have been sent out, but out-of-towners who wish to attend the dance may get in touch with Mrs. William L. Morgan, Jr., 2 Poplar Place, Boston.

Our final food sale of the season will be held on May 2 in the Brick Corridor, under the supervision of Mrs. Edward L. Ferguson. Proceeds from this sale will help defray the expenses of the Spring Dance and other Distaff projects.

The Club looks forward to June 8, when it will have an outdoor family gathering in Concord. A similar event was so enjoyable last year, we have decided to repeat it. It will be something of a farewell party for the many members of the house staff who are leaving the Hospital this coming summer.

New addresses:—

Dr. Joseph J. Barlow (r.p. 1955), Presbyterian Hospital, 620 W. 168th St., New York, N. Y.
Dr. William P. Boger (a.r.p. 1942), Dept. of Research Therapeutics, Norristown State Hospital, Norristown, Pa.
Capt. Carl N. Brownsberger, MC, USAR (a.r.p. 1957), 121st Evacuation Hospital, APO 20, c/o Postmaster, San Francisco, Calif.
Dr. Harvard H. Crabtree (*E.S.* 1913), 1101 Beacon St., Brookline, Mass.
Dr. David S. Dann (h.p. *R.* 1922), 701 E. 63d St., Kansas City, Mo.
Dr. James F. Donovan (sr.r.s. *Or.* 1957), 85 Jefferson St., Hartford, Conn.
Dr. Arvil J. Hinshaw (*E.S.* 1947), 308 Doctors Bldg., 3155 Stagg Drive, Beaumont, Tex.
Dr. Robert W. Hopkins (*S.* 1948), Dept. of Surgery, Cuyahoga County Hospital (formerly City Hospital of Cleveland), Cleveland 9, Ohio
Dr. Edwin H. Mulford, II (a.r.s. *N.S.* 1947), 1 Atlantic St., Stamford, Conn.
Dr. William R. Owen (*M.* 1950), 643 Hermann Professional Bldg., 6410 Fannin St., Houston, Tex.
Dr. John B. Stetson (a.r.p. *An.* 1953), 827 W. Locust St., Johnson City, Tenn.
Dr. Beth Vincent (*W.S.* 1903), 939 Boylston St., Boston 15, Mass.
Dr. C. Gene Wheeler (*S.* 1956), PHS Indian Hospital, Lawton, Okla. (until September).

Brief bit:—

Dr. Bradford Cannon, who is president of the American Association of Plastic Surgeons, will preside at the meeting of the Association in Dallas, on May 22-24.

* * *

It was not only a pleasure, but a relief, to receive this letter from Dr. Charles G. Craddock, Jr. (a.r.p. *Psychiat.* 1950). For several years Dr. Craddock's name has appeared in the Directory section of the *Annual Report,* followed by "address unknown". None of our many efforts at locating him had succeeded. Along in February we made one last attempt, which proved fruitful. From the University of California Medical Center, Los Angeles 24, California, where Dr. Craddock is Associate Professor of Medicine, he writes:

> I apologize for not corresponding with you sooner. However, I have moved several times in the last two years and your letter was delayed in reaching me.
>
> I have been at the above address for the last six years, but was called back into military service for a year and a half, from July 1955 through January 1957.
>
> It is always nice to hear again from people at the General.

THE NEWS

No. 178 Boston, Mass. June 1958

THE MEDICAL ACOUSTICS RESEARCH LABORATORY

April 23, 1958

Dr. David McK. Rioch
Walter Reed Army Medical Center
Washington, D.C.

Dear Dave:

I greatly enjoyed chatting with you at the meeting of the Harvey Cushing Society in Washington last week. It is difficult to realize that more than five years have passed since you first suggested that our Medical Acoustics Research Group explore the possibilities inherent in the use of focused ultrasound for investigation and treatment of the central nervous system. During our recent conversations you expressed some curiosity as to the history of the Medical Acoustics Research Laboratory at the Massachusetts General Hospital. For this reason, I am setting down these remarks in the hope that you will find them of interest.

My introduction to that branch of physics known as "ultrasound" came about quite by accident. In October 1948, Professor John Trump of the Massachusetts Institute of Technology forwarded to Dr. Milford Schulz, Department of Radiology at M.G.H., an article typewritten in German by Dr. Karl Theo Dussik of Bad Ischl, Austria. In this communication Dr. Dussik stated that he had been able to visualize by the use of transmitted ultrasonic waves the ventricles of the brain and, in certain cases, even the presence of brain tumors. He further stated that this method could be employed without the necessity of filling the cerebral ventricles with air (as is the case when a pneumoencephalogram is performed) and that no discomfort or risk was incurred by the patient undergoing the examination. Milford Schulz thought that this report was of sufficient interest to warrant further investigation and turned it over to me.

Since my knowledge of German was limited, I had first to obtain a translation of Dussik's paper and after that to relearn a little physics. I found that the term "ultrasound" was applied to those mechanical vibrations of a frequency above that which the human ear can receive and interpret as "sound". The upper limits in frequency for the ear are about eighteen thousand to twenty thousand cycles per second. The vibrational waves which Dr. Dussik was using were of the order of one million cycles per second. At these higher frequencies the waves travel only an infinitesimal distance in air but can still be propagated fairly well in fluid or semisolid media.

It was obvious that the ultrasonic method of depicting the intracranial contents had many potential advantages over our current x-ray procedures, but it was also evident that such a new technique as described by Dr. Dussik would have to be explored by a team of investigators. Accordingly, I attempted to enlist the aid of Dr. Richard Bolt, Director of the Acoustics Laboratory, Massachusetts Institute of Technology. We talked over the personnel and instrumentation required and Dr. Bolt came regretfully to the conclusion that his laboratory had neither the manpower nor the space nor the funds to be of help in investigating the use of ultrasound for neurological diagnosis.

In February 1949, I was told that at a German Trade Exposition then being held in New York City a young German physicist from the Siemens Company, Erlangen, Germany had been exhibiting certain ultrasonic devices aimed toward producing heat deep within the human tissues for the treatment of aches, sprains, and strains. My informant also told me that this young man seemed to have an excellent background in medical physics. Accordingly, I went to New York and met Theodor Hueter, Ph.D. I told him of Dr. Dussik's work and he expressed interest in it and in coming back to the United States to work on the problem.

Through the early months of 1949, Dick Bolt and I discussed many times the problem of further investigation of the neurological uses of ultrasound. One day in July he told me that he would be attending an acoustics society meeting in England. It occurred to me that this might be an ideal opportunity to gain firsthand information concerning the work then being conducted in Bad Ischl, Austria. I wrote to Colonel William Stone, Chief of Research and Development for the Surgeon General of the Army, and asked if he could be of any assistance. To my great delight Colonel Stone was able to authorize for me a flight to Austria under Army auspices.

The trip to Bad Aschl encompassed only ten days from the time I flew out of this country until my plane touched down in Springfield, Massachusetts once again. During that period I saw Dr. Hueter in Erlangen, Germany and persuaded him to take leave of absence from his firm to come to the Acoustics Laboratory at M.I.T. to work on our project. Then, there was a quick trip to Munich where Dick Bolt and Ted Hueter joined me and we took off for Salzburg, Austria. From that city we drove to Bad Ischl, talked with Dr. Dussik and his brother, who was working with him, and came back full of enthusiasm. In December of 1949, Ted Hueter joined the Acoustics Laboratory, M.I.T., the Research Committee of M.G.H. gave us $6500 for "preliminary exploration of the use of ultrasound in neurological diagnosis", and we were off!

During the next four years, with the help of funds from the American Cancer Society and the Cancer Institute of the National Institutes of Health, we learned a great deal about the interaction of ultrasound with human tissue. During our first year we had advice and assistance from Dr. George Ludwig, then an Assistant Resident on the Surgical Service at M.G.H. and now Assistant Professor of Medicine at the Hospital of the University of Pennsylvania. We found that it was indeed possible to pass a beam of ultrasound from one side of the skull to the other without damage to the intervening brain. Furthermore, differences in attenuation of this beam of ultrasound as it passed through the brain made it possible to detect a rough outline of the cerebral ventricles. Unfortunately, however, the variations in thickness of the skull cast unwanted "shadows" in the ultrasonograms which we obtained by scanning the brain. These shadows in too many instances obscured the vital information which we were seeking in reference to the position of the cerebral ventricles. We felt, therefore, that although the use of an unfocused beam of ultrasound offered many advantages over x-rays so far as ease of procurement of information was concerned, the method did not have a sufficiently high degree of reliability to warrant its routine use. I should say, however, that further investigations, notably by Douglas Howry at the University of Colorado, and further refinements of ultrasonic instrumentation have again introduced the possibility that a thin beam of ultrasound may eventually be useful as a diagnostic tool.

During the years that we worked on this use of ultrasound, William J. Fry at the University of Illinois had been investigating the possibility that ultrasound could be used to destroy small areas of the central nervous system. This possibility had been explored in 1944 by Dr. Tracy Putnam and his collaborators in New York. They, however, had attempted to produce focal areas of destruction in experimental animals by irradiating with a beam of focused ultrasound through the scalp and skull. Unfortunately, this method had produced undesirable damage to the scalp and skull, and for this reason Dr. Putnam had apparently abandoned his investigations.

Nevertheless, there seemed to be no question about the fact that a beam of ultrasound could be focused (in the same way that light can be concentrated) into a small volume of very high intensity, and it seemed logical to assume that it might be possible to choose an intensity at the point of origin of the beam of focused ultrasound, together with an irradiation time, which would result in damage only to those tissues in the focal region of the ultrasonic beam.
